Air Technical Intelligence (ATI) Section, which is responsible for air technical intelligence, providing vital data on characteristics, performance, vulnerability, field of fire, and recognition of enemy aircraft. Information is derived from examination and analysis of captured, crashed or otherwise acquired articles of enemy equipment. It supplies intelligence for combat operations, economic warfare, and target information, and leads to improvement of domestic designs and to the development of countermeasures against enemy equipment. Examination and tests of captured equipment reveal new design and engineering trends and assist materially in estimating enemy production. *(See Chapter XV.)*

Air Prisoner of War (APW) Section, which is responsible for interrogation of air prisoners and exploitation of capture documents. It coordinates the acquisition of up-to-date details on the enemy air force order of battle, and supplies other intelligence that can be used for combat operations, economic warfare, psychological warfare, and target information. Information obtained from air prisoners of war must be evaluated and checked against other sources before it can be accepted. *(See Chapter XIV.)*

Air Interpreter-Translator (I-T) Section, which is responsible for translation of foreign documents and for supplying the interpreters and translators needed for intelligence.

TECHNICAL INTELLIGENCE DIVISION OF AIR MATERIEL COMMAND

The central Air Force agency responsible for air technical intelligence is the Air Materiel Command (AMC). Among other missions, the Commanding

1260

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

General of AMC is charged with the operation of the technical intelligence services of the Air Force and with the training of air technical intelligence officers. Within AMC, direct responsibility for technical intelligence is placed with the Technical Intelligence Division, which is staffed with specialized personnel. The laboratories of the Engineering Division of the Command can be used for research and analysis. AMC trains ATI personnel for assignments throughout the Air Force and directs the collection of air technical intelligence throughout the world, using the military attache system, foreign observers, and the intelligence staffs of combat and service units. To carry out its responsibilities, the Technical Intelligence Division distributes ATI information and publishes manuals to guide personnel in the field.

Technical intelligence from the field is channeled into AMC for final analysis and evaluation by technical intelligence. Equipment and documents examined by field units are forwarded to AMC for further exploitation and for tests when necessary.

The Technical Intelligence Division specifically endeavors to maintain up-to-date information on all foreign materiel including:

a. Performance and characteristics.

b. Quality of workmanship and materials.

c. Sources of raw material.

d. Recognition features.

e. Design and construction.

f. Maintenance and supply, including manufacturing facilities.

INTELLIGENCE DIVISION, G. S., U. S. ARMY

Its purpose is to collect and evaluate information and to disseminate intelligence pertaining to foreign countries, their war potential and military forces, in so far as it might affect the mission of the U. S. Army.

Its functions are five-fold:

a. Procure information and intelligence relative to the activities of individuals or agencies potentially or actually dangerous to the preservation of the military establishment within the Zone of Interior.

b. Execute counterintelligence measures.

c. Collect within the Zone of Interior foreign positive intelligence.

d. Meet the intelligence requirements of the U. S. Army, continental and overseas commands, and the administrative and technical services.

e. Represent the Department of Army on intelligence and counter-intelligence matters with other departments of the government and with foreign governments.

It is organized into the following sections and groups:

a. Planning and Coordination Section.

b. Personnel and Administrative Section.

c. Foreign Liaison Section.

d. Security Group.

e. Army Security Group.

f. Counter Intelligence Corps.

g. Training Group.

h. Intelligence Group.

OFFICE OF NAVAL INTELLIGENCE

Its purpose is to administer, operate and maintain the intelligence service of the Navy in order to inform the top naval authority of all potentials and intentions of foreign nations and of situations or trends threatening the security of the Naval establishment.

Its functions are as follows:

a. Exploit all sources in order to collect information.

b. Supply information and intelligence required to protect the naval establishment against espionage, counter-espionage, and sabotage.

c. Supply information and intelligence needed by the policy planning, the operating and logistical offices of the Navy.

d. Coordinate intelligence activities of the Navy Department.

e. Maintain working liaison in matters pertaining to intelligence with Army, Air Force, State Department and other Federal Intelligence Agencies.

f. Conduct or participate in joint intelligence activities.

g. Sponsor and assist in training of naval intelligence personnel.

It is organized into the following branches:

a. Administrative Branch

b. Liaison

c. Plans

d. Domestic Branch

e. Foreign Branch

f. Operational Intelligence Branch

g. Air Branch

1261

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

DEPARTMENT OF STATE

Special Assistant for Research and Intelligence

Its purpose is to advise and assist the Secretary of State in the field of foreign intelligence, and to formulate and execute a Departmental program for providing the foreign intelligence required by him in the conduct of foreign affairs and the safeguarding of the national security.

The Special Assistant for Research and Intelligence performs the following major functions:

a. Advises and assists the Secretary in the development and implementation of a comprehensive and coordinated foreign intelligence program for the United States.

b. Develops and implements a coordinated program for positive foreign intelligence for the Department, including the procurement of the requisite information and materials and the production of the intelligence studies and spot intelligence pertinent to the formulation and execution of foreign policy.

c. In collaboration with the appropriate geographic functional, and administrative offices, develops such instructions to the field as may be required by the Departmental and national intelligence programs.

d. Determines which of the information and materials flowing into the Department are required for the production of timely intelligence.

e. In consultation with the Assistant Secretary for Administration, adopts such special security measures within the intelligence organization, in addition to Departmental security regulations, as in his judgment may be required by the nature of the work.

f. Serves as chairman of the Advisory Committee on Intelligence.

g. Represents the Secretary on the Intelligence Advisory Committee, which advises the Director of Central Intelligence, National Security Council; on the Joint Intelligence Committee of the Joint Chiefs of staff; and on other inter-agency intelligence committees; and supervises Departmental participation in such groups.

In relationship with other agencies, the Special Assistant to the Secretary has relationship with:

a. The Army, Air Force, and Navy Departments, through the Intelligence Advisory Committee, to advise the Director of Central Intelligence, National Security Council, in the coordination of foreign intelligence affecting the national security, and, through the Joint Intelligence Committee, to advise the Joint Chiefs of Staff on intelligence matters.

b. The Army, Air Force, and Navy Departments, the Central Intelligence Agency, and other appropriate Federal agencies, to coordinate activities in the interests of the research and intelligence program of the Department and to participate in the national intelligence program.

c. Non-Federal organizations and individuals, to supplement the research and intelligence program of the Department.

CENTRAL INTELLIGENCE AGENCY (CIA)

The Director of Central Intelligence Agency has the following duties:

a. Advise the National Security Council (NSC) in matters concerning such intelligence activities of the departments and agencies of the government as relates to national security.

b. Make recommendations to NSC for coordination of such intelligence activities of the departments and agencies of the government as relate to national security.

c. Correlate and evaluate intelligence relating to national security, and provide for the appropriate dissemination of such intelligence within the government.

d. Perform, for the benefit of the existing intelligence agencies, such additional services of common concern as the NSC determines can be more efficiently accomplished centrally.

e. Perform such other functions and duties related to intelligence affecting the national security as the NSC may from time to time direct.

f. Central Intelligence Agency (CIA) produces national security estimates.

JOINT INTELLIGENCE COMMITTEE (JIC)

Its membership consists of the following:

a. Assistant Director of the Joint Staff for Intelligence.

b. Director of Intelligence, U. S. Air Force.

c. Director of Intelligence, G. S., U. S. Army.

d. Chief of Naval Intelligence.

Procedure:

a. Establishes its own methods of procedure.

b. Maintains close liaison with the planning and policy formulating agencies of the Joint Chiefs of Staff (JCS).

c. Coordinate and integrate intelligence received from all sources.

1262

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

d. If unable to reach agreement promptly, submit appropriate report to JCS for action.

e. Request information, intelligence, and assistance from all member agencies and activities.

f. Utilize CIA in procuring information, intelligence, and assistance from governmental agencies and activities.

g. Establish, with the cooperation of interested governmental agencies and activities, special subcommittees on matters of continuing interest to the JCS.

h. Maintain a permanent joint intelligence group consisting of members detailed from the respective organizations of the members of the JIC and from the CIA, functioning as a committee under the jurisdiction of JCS.

Joint Intelligence Group

Its functions are:

a. Prepare responses to directives and requests addressed to JIC, and to other papers, as directed by JIC, for JIC approval.

b. Make recommendations to JIC, as occasion may require, on its own initiative.

c. Act for JIC in such matters as JIC may delegate to it.

d. Joint Intelligence Committee (JIC) produces military estimates.

OTHER SOURCES OF AIR INTELLIGENCE INFORMATION

a. Foreign Press and Radio

b. Foreign Technical Publications

c. Agents and Fellow Travelers

d. Library of Congress

e. Federal Departments

f. Treasury

g. Justice

h. Interior

i. Labor

j. Commerce

k. Independent government agencies such as the Maritime Commission, Pan American Union, etc.

l. Private agencies.

There is no set rule in the search for information of intelligence value. Upon occasion, the most unlikely goose is apt to lay a golden egg.

Questions and Leads for Classroom Discussion

1. Can a source of ordinary information be a source of intelligence information?
2. Who should understand the uses of Photo Intelligence?
3. What is Electronics Intelligence derived from?
4. What is Capture Intelligence?
5. What is Air Technical Intelligence?
6. What are the functions of the Intelligence Division, G. S. U. S. Army?
7. What is the purpose of the ONI?
8. Name three civilian intelligence agencies.

CHAPTER XI

AIR INTELLIGENCE DIRECTORATE, USAF

The Air Intelligence Division, USAF, is the primary agency for the collection, evaluation, interpretation, and dissemination of air intelligence. Hence, a general working knowledge of the organization and its detailed functions is necessary.

AIR FORCE INTELLIGENCE MISSION

The Air Force Intelligence mission as stated in Air Force Regulations is: "The present and future capabilities, in range and power, of air weapons demand, the accomplishment of an intelligence mission which will: (a) Insure the prevention of strategic, tactical, or technological surprise from any source, (b) provide air intelligence required for command decisions and counsel upon air preparedness and air operations."

Responsibilities

The responsibility for carrying out this Air Force intelligence mission is invested in the Director of Intelligence, who is responsible to the Deputy Chief of Staff for Operations, USAF. The Director of Intelligence directs, supervises, and controls United States Air Force intelligence activities. His responsibility is: (a) to provide air intelligence requirements for the successful accomplishment of the USAF mission, and (b) to provide USAF representatives on the Joint Intelligence Committee of the Central Intelligence Advisory Committee of the Central Intelligence Agency, the U. S. Communications Intelligence Board, and others as may be directed.

Organization and Functions

In studying the functions of the Air Intelligence Directorate, it will first be noted that there is no office directly responsible for the administration of the Air Intelligence Directorate. At the present time, it is considered that the Deputy Chief of Staff for Operations, as the office above that of the Director of Intelligence, will supply the necessary housekeeping and administrative details essential to the work of the Air Intelligence Directorate.

1265

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

The Chief of the Air Intelligence Policy Division

The Chief of the Air Intelligence Policy Division now acts as the Deputy Director of Intelligence and provides executive services and continuity of effort in the support of the Director of Intelligence in the supervision and management of the Intelligence Directorate activities. He performs functions of the Director of Intelligence pertaining to air intelligence planning and policy matters; foreign liaison activities; and policy matters concerning the safeguarding of military information.

The Plans and Policy Branch

The Plans and Policy Branch formulates overall USAF intelligence policies, (except policy matters concerning the safeguarding of military information), plans, programs, and basic procedures, and issues suitable directives to achieve desired intelligence objectives. This branch provides overall monitoring of combined, joint and inter-departmental intelligence activities which include those within the cognizance of the Joint Intelligence Committee of the Joint Chiefs of Staff and the Intelligence Advisory Committee of the Central Intelligence Agency. It monitors and recommends action relative to the functions, organization and manning of the Directorate. It also monitors activities related to the training of USAF intelligence personnel and recommends training standards and requirements.

The Foreign Liaison Branch

The Foreign Liaison Branch provides the official channel of communication between representatives of the Department of the Air Force and authorized foreign military representatives in this country. It monitors and recommends policy with respect to Air Staff relationship with foreign nationals. It dispatches to authorized foreign military representatives in this country written military information requested consistent with prescribed security policy. It makes arrangements for disclosure of oral military information through the medium of visits by foreign nationals to USAF installations and commercial facilities. This branch supervises arrangements for tours by foreign nationals including the procurement and accounting for necessary funds. It supervises arrangements for accrediting foreign military personnel as may be considered necessary. It extends invitations and processes requests for foreign military personnel to be assigned as students, observers or liaison officers at USAF installations. It advises the Air Staff on military protocol matters and assists in extending appropriate USAF courtesies.

The Security Policy Branch

The Security Policy Branch proposes, promulgates, recommends revision of, and interprets policies and broad procedures related to the safeguarding of military information within the USAF, the release of USAF classified information to foreign governments and to U. S. Federal and State agencies and private individuals and corporations, the security classification and downgrading of USAF information and material, travel control and military, civil and prisoner of war censorship. It monitors USAF representation and participation on policy matters concerning safeguarding of military information with other departments and agencies of the government.

The Chief of the Air Intelligence Requirements Division

The Chief of the Air Intelligence Requirements Division performs the duties of the Director of Intelligence pertaining to the collection of intelligence information, the control of sources of intelligence information, and the dissemination of intelligence.

The Collection Branch

The Collection Branch determines USAF requirements for intelligence information with respect to the air-war potential and the strategic vulnerability of foreign countries; furnishes statements of USAF intelligence requirements to established collection agencies, including subordinate USAF echelons.

It collects intelligence information concerning the physiography, military air and airborne forces, aircraft and air facilities (both military and civilian), and the strategic vulnerability of foreign countries.

It establishes a two-way flow of intelligence information necessary to the production of adequate intelligence at all echelons of USAF commands; determines what intelligence and intelligence information will be disseminated to activities of military and governmental agencies.

Ascertains technical intelligence requirements of USAF in coordination with appropriate commands; recommends intelligence requirements and techniques relating to special sources of information; maintains a control system over all requests for intelligence information and materials.

Operates the USAF program for exploitation of German and Austrian scientists.

Maintains records of intelligence activities of Air Attaches to determine their meeting of required

1266

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

collection responsibilities and operates the intelligence collection portion of the Air Attache system.

Analyzes and evaluates existing and potential sources of information with respect to their intelligence value to USAF; establishes techniques and requirements pertaining to interrogation of captured enemy personnel and an Escape and Evasion program in the event of a future emergency; monitors the exchange of technical information with foreign countries.

Supervises expenditure of funds required by intelligence collection agencies of USAF for purchase of publications, materials and services for intelligence uses; supervises the participation of USAF commands in the inter-services program for collection of foreign and domestic intelligence information within the United States.

Briefs and interrogates selected military personnel on intelligence information requirements before departure for, or upon return from, areas of potential USAF intelligence interest.

The Documents and Dissemination Branch

The Documents and Dissemination Branch receives, receipts for, records and screens all intelligence material made available to the Director of Intelligence; reproduces and disseminates this material through the media of direct allocation or publication of a brief of the document on a daily Accession List from which requests are received and filled; monitors Accession Lists of other agencies and requests documents of value to USAF.

Selects and forwards documents of primary interest to the appropriate USAF command with a request for an intelligence estimate; which estimate is then disseminated throughout the USAF.

Maintains liaison with all governmental intelligence agencies in the Washington area; provides the Director of Intelligence representation on all military and civilian reading panels and document centers in Washington.

Maintains liaison with all Joint and/or Combined Intelligence activities; to obtain reports and publications to fill USAF needs.

Maintains an intelligence library as a repository for all non-technical intelligence information received in Headquarters, USAF; renders standard library service thereon, and operates a reading room for use of this material.

Prepares and maintains standard distribution lists and records; requests intelligence documents procured by agencies other than Director of Intelligence, and establishes proper distribution of these documents, receives and answers all requests from USAF agencies for Army, Navy, CIA, and State Department publications.

Determines what air intelligence and air information will be disseminated to activities from military and governmental agencies; arranges for the publication of Director of Intelligence air intelligence reports, intelligence information and other data to be disseminated in such a manner as to insure economy and reproduction consistent with the nature, content, and quality required.

The Reconnaissance Branch

The Reconnaissance Branch recommends requirements and techniques for aerial photographic reconnaissance.

It provides Director of Intelligence representation on the Joint Map and Photographic Committee; the Joint Topographic Sub-Committee; of Air Photography, Mapping and Charting for Defense of the Canadian-United States Joint Board on Defense, and all such other Joint activities in connection with mapping and charting from photography where there is an air intelligence interest.

Monitors plans and establishes requirements for photography obtained and produced by Air Attache; monitors foreign mapping and photographic agreements.

Coordinates with other services on topographic matters and maintains USAF interest in such topographic subjects as are related to air intelligence.

Performs limited photographic intelligence studies of special nature for Headquarters USAF. Monitors general photographic intelligence projects conducted by subordinate commands in order to coordinate with the overall photographic intelligence effort of USAF.

Reviews, evaluates, processes and causes reproduction of photographic intelligence material and maintains photographic intelligence report files.

Advises interested agencies on the technical aspects of photo interpretation in connection with security and classification of aerial photography.

The Air Attache Branch

The Air Attache Branch directs and supervises the activities of the Air Attache System.

It determines officer requirements, nominates and indoctrinates Air Attaches, Air Observers and Air Technical Liaison Officers in foreign countries; monitors USAF training and indoctrination of Air,

1267

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Army and Navy Attaches in air matters; acts as coordinating agency for all USAF relations with Army and Navy Attaches; and arranges for the dissemination of educational and other material to Air Attaches.

Selects the types and coordinates the assignment of aircraft to be used by Air Attaches; maintains assignment records and monitors employment and administration of aircraft.

Processes administrative letters and cables to and from Air Attache offices; maintains records of activities of Air Attaches to determine their meeting of prescribed responsibilities; maintains detailed personnel records of all officer and enlisted personnel in the Attache system; prepares letters of commendation and of noted delinquencies for transmission to the Air Attaches.

The Chief of the Air Intelligence Division

The Chief of the Air Intelligence Division performs the duties of the Director of Intelligence pertaining to the production of air intelligence necessary to Headquarters USAF for command decision and counsel upon air preparedness and air operations; recommends the requirements for the production of air intelligence by USAF commands and governmental intelligence agencies in support of the Air Force intelligence mission; maintains close coordination with those intelligence producing agencies in the interest of furthering the fulfillment of air intelligence production requirements recommended.

The Supplemental Research Branch

The Supplemental Research Branch discharges the responsibilities of the Director of Intelligence in connection with supplemental research activities.

The Offensive Air Branch

The Offensive Air Branch produces air intelligence on the offensive capabilities of alien air power; determines and establishes, as the originating agency, air order of battle estimates of all foreign countries.

It maintains complete and current statements, consistent with information available, of the following on all foreign countries; offensive doctrines and tactics; effectiveness of offensive air weapons; that status of training and serviceability of offensive air organizations; and logistical factors, including bases for offensive operations, which may modify offensive air effectiveness.

Analyzes foreign civil air information and integrates same into offensive air potentialities of foreign countries.

The Defensive Air Branch

The Defensive Air Branch produces air intelligence on the defensive capabilities of alien air forces and on the defensive capabilities of all counter-air weapons of foreign nations against offensive air operations, and coordination with the Intelligence Department, Air Materiel Command.

Analyzes the capabilities of surface-to-surface, air-to-surface, and air-to-air guided missiles and their technical features now developed or contemplated by all alien countries.

Analyzes electronics as applied to detection, identification, guidance, control and communications, existing or contemplated in all alien countries.

Analyzes foreign nuclear physics activities as applied to guided missiles and airborne equipment; foreign biological activity as applied to guided missiles and airborne equipment.

Analyzes the capabilities, characteristics and performance of all conventional and non-conventional foreign aircraft and aircraft engines and their technical features existing or contemplated by all alien countries.

Collates, evaluates, and interprets all information on foreign land-based and ship-borne anti-aircraft artillery, and surface-to-air missiles, including technical information on performance characteristics of weapons and fire control instruments, current tactical doctrine, techniques of employment, and order of battle.

Collaborates in development of new and improved methods of analyzing all types of enemy land-based and shipborne anti-aircraft defenses and in preparation of flak computers and other special equipment for facilitating and improving current methods of flak analysis. This includes liaison and collaboration with the Flak Analysis Section of the AA School.

The Air Facilities Branch

The Air Facilities Branch produces air intelligence on conditions and installations outside the continental limits of the United States of particular concern to possible air operations, notably airfields. It provides general description of weather, transportation and terrain as factors affecting airfields and airfield potentials.

The Strategic Vulnerability Branch

The Strategic Vulnerability Branch determines the

1268

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

extent and vulnerability of the various segments of war-making capabilities of all countries, including the United States, to air attack and recommends specific and general tactical objectives for air attack.

Maintains an encyclopedia of detailed information concerning all potential air objectives in foreign countries and the United States.

Assembles and maintains intelligence data on air objectives necessary for the production of air objective folders.

The Air Estimates Branch

The Air Estimates Branch prepares and presents overall estimates of the air capabilities and strategic vulnerability of alien or coalitions of alien powers.

Maintains and operates an Air Intelligence room for the use of the Chief of Staff, USAF, for the purpose of presentations and briefings of top level military, civilian, congressional, and other governmental leaders.

Processes information available on foreign inspired subversion activities for inclusion in the overall estimate of foreign capabilities and vulnerability.

The Information Security Branch

The Information Security Branch proposes, promulgates, recommends revision of, interprets policies and procedures relating to, and coordinates with other governmental agencies where appropriate in connection with safeguarding military information within the USAF classified information; security classification and downgrading of USAF information, including specific items of materiel and technical information.

Reviews and recommends action on the release of classified information to the requesting Federal, State and private agencies or individuals, and to foreign governments, including visits to USAF installations and facilities.

Advises USAF agencies and USAF personnel concerning approved security policies in connection with proposed publications, plans, and procedures; reviews reports of violations of security and the compromise of classified information. Transmits these reports to appropriate USAF or other agencies.

Establishes and supervises a continuing program for indoctrinations of USAF personnel in responsibilities and procedures concerning the safeguarding of military information; surveys USAF organization and facilities to determine the adequacy of USAF policies and directives relating to the safeguarding of military information.

Represents the Director of Intelligence, USAF, on the Headquarters USAF Committee on the release of technical information; furnishes USAF representation on the State-Army-Navy Air Coordinating Committee for Military Information Control.

Operations

Not only does the Air Intelligence Directorate receive direct reports from the air attaches, but all foreign service activities which might indirectly or directly come across information of interest to the Air Force. This information, however, would come back to the headquarters of the particular foreign service activity concerned before being disseminated to the Air Force. Any service having information vital to the Air Force will disseminate it through its normal intelligence channels to the Air Intelligence Directorate. Information from the State Department, as a general rule, is received through the Central Intelligence Agency. The Central Intelligence Agency furnishes the Air Force with intelligence information of interest that has been obtained through the various governmental agencies in our executive and administrative branches of government. Industries and other civilian organizations such as the Press Association, National Association of Manufacturers, etc., furnish a tremendous amount of information of vital air interest.

In general, there are two types of intelligence information that the Air Intelligence Directorate is interested in, and which must be collected, evaluated and interpreted in order to produce intelligence information for the various USAF commands. These are: (1) raw information intelligence, and (2) completed military, economic, social, and political intelligence information estimates.

Raw information intelligence is that data received that has not been evaluated or interpreted from an air viewpoint. Completed military, economic, social, and political estimates may also have been received without being evaluated or interpreted from an air force viewpoint. The military sources from which these completed estimates are obtained are:

a. The Joint Intelligence Committee (Joint Intelligence Group), *b.* various air commands, especially those overseas or in outlying U. S. possessions, *c.* the Intelligence Division of the Army General Staff, and *d.* the Office of Naval Intelligence. All of these intelligence estimates should be interpreted

1269

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

in addition to other information at hand in order to produce an air intelligence estimate of the particular subject or project contained in the original intelligence estimate. The Central Intelligence Agency is not only producing military, but also economic, social, and political intelligence estimates. These estimates are made not only for use within their organization, but also for the State Department and other governmental agencies. In turn, these estimates must be interpreted for air intelligence use.

This intelligence data is disseminated to the various air commands to assist them in accomplishing their particular mission as an example. The intelligence of world-wide air objective targets may interest the Strategic Air Command in particular areas only and all the data now being produced in the Air Intelligence Directorate regarding air objective targets may not necessarily be immediately disseminated to the Strategic Air Command because their mission or interests change from time to time.

SUMMARY

In general, the Director of Intelligence, Headquarters, USAF, has the responsibility for providing air intelligence requirements for the successful accomplishment of the U. S. Air Force mission.

The Air Intelligence Policy Division, in general, performs functions pertaining to air intelligence planning, policies, foreign liaison.

The Air Intelligence Requirements Division performs duties pertaining to the collection of air intelligence information, the control of the sources of air intelligence information, and the dissemination of air intelligence throughout the USAF.

The Air Intelligence Division produces, in general, air intelligence necessary to Headquarters, USAF, for command decisions and counsel upon air preparedness and air operations.

The collection, evaluation, interpretation of data from the various sources may come to the Air Intelligence Directorate as raw information or intelligence, or as completed military, economic, social, and political estimates which must be evaluated and interpreted for air intelligence.

The dissemination of air intelligence to the various air commands is made for the purpose of assisting them in accomplishing their particular mission.

Questions and Leads for Classroom Discussion

1. What is the Air Force Intelligence mission?
2. What office is directly responsible for the administration of the Air Intelligence Directorate?
3. Who formulates overall USAF intelligence policies?
4. What are some of the functions of the Security Policy Branch?
5. Discuss the functions of the Collection Branch.
6. What are the functions of the Reconnaissance Branch?
7. What are the responsibilities of the Offensive, Defensive and Estimates Branches of the Air Intelligence Division?
8. What is the purpose of disseminating Air Intelligence to the various air commands?

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

CHAPTER XII

PHOTOGRAPHIC INTELLIGENCE

Photo-Intelligence ranks foremost among the special sources of Air Intelligence. Through the highly developed techniques of photo interpretation, photographic intelligence provided from 50% to 90% of the intelligence information available during the war.

As compared to other sources of intelligence, this specialized method has an A-1 classification as to source and dependability. It may usually be obtained in a much shorter time than any other, it can provide a complete coverage of the subject, it produces chronological records of the subject which can be studied for many hours as compared to brief glimpses of visual observation. It is more adequate than visual observation because special filters and equipment may be applied to the problems of enemy camouflage and haze conditions incidental to high altitude positions of observation.

CAPABILITIES AND LIMITATIONS

Many of the capabilities and limitations listed under general military use of aerial photos apply to specific uses also. Those listed under specific headings apply directly to that particular subject. In some cases, capabilities and limitations given under general military use are rephrased or restated under specific uses to emphasize a certain point. In other cases they are omitted to avoid repetition.

a. For General Military use.

Capabilities:

1. Provide the most accurate and extensive source of information relative to the strength, disposition and activities of the enemy in areas not readily accessible to ground observers.

2. Provide extensive and detailed information regarding the enemy's installations and equipment, and general terrain features of areas under his control such as vegetation, soil, beaches, water depths.

3. Provide a means of detecting errors, and data from which recommendations can be made for improvement in operational techniques.

4. Provide highly accurate information for preparation and revision of maps and charts.

1271

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

5. Provide an indication as in bomb damage clearance and reconstruction studies, of the enemy's evaluation of the importance of damage inflicted on him.

6. Provide target data material for operational use, e.g. annotated plans for bombardiers.

7. Makes possible an evaluation of (friendly) camouflage and passive defenses.

8. Can usually detect and "pierce" camouflage designed to confuse an aerial observer or bombardier.

9. Provide a check on the accuracy of reports from agents, collaborators, and prisoners of war covering visible objects or activities.

10. Provide a means for assessing the physical effectiveness of weapons and air attack.

Limitations:

1. Securing detailed intelligence in many photo interpretation studies requires extensive background experience and training (e.g., construction and production engineering), constant practice and correction of errors (e.g., in identification and height determination), and additional information from other sources.

2. Accurate assessment of the enemy's activities usually cannot be made from photographs alone. Supplementary information from other sources is needed. It should be especially noted that in cases short of complete destruction, photo interpretation of bomb damage to installations such as factories may be very inaccurate if based solely on visible damage.

3. Scale is a function of altitude of camera carrying aircraft and the focal length of the camera; and as a general rule aerial photographs of a scale smaller than approximately 1:10,000 (R.F.) are not adequate for detailed work.

4. Photographs are subject to certain inadequacies inherent in the design of the camera used, flight of the aircraft (tilting, etc.) and faults in processing the negative and prints.

5. Interpreter must have detailed knowledge of the enemy's living habits, customs and military techniques.

6. General knowledge of topographic and geologic features in the enemy country is very important.

7. The photo interpreter is dependent on adequate aerial photographs and these in turn depend directly on favorable light and weather condition, and, in combat areas, often on the performance of reconnaissance aircraft or skill of the pilot.

8. Ground defenses may prevent securing photographs of adequate scale for certain studies.

b. For Air Order of Battle use.

Capabilities:

1. Provide source material for preparing detailed study of enemy aircraft types and numbers at a specific time.

2. Provide general knowledge of enemy capabilities as related to airfields and such equipment as runways, lights, navigational aids, and hangar facilities.

3. Provide information regarding rates of aircraft production at aircraft factories.

4. Provide information regarding changes in aircraft strength and disposition.

Limitations:

1. May be difficult to cover all enemy airfields at approximately the same time and thus secure the overall numerical air strength.

2. Comparative photo coverage is necessary to determine changes in disposition of aircraft.

3. Limited accuracy in determining operational capabilities of aircraft.

4. Inability to accurately identify certain aircraft, particularly fighters, on photographs of a scale of 1:10,000 (approximate) and smaller.

5. Inability to account accurately for numbers of aircraft in camouflaged parking areas, hangars, etc.

6. Technical knowledge of aircraft and related facilities are necessary for accurate evaluation of aircraft, performance, production facilities, and air installations.

c. For Air Target Analysis.

Capabilities:

1. Provide extensive information of enemy installations, their definite location, general extent and construction, and general activity.

2. By use of comparative cover, information as to alterations and new developments of air targets can be obtained.

3. Provide information regarding relative value of various targets which is very essential in target selection.

4. Provide information regarding the most vulnerable parts of a target.

5. May provide means of identifying camouflage and evaluating its effectiveness against the

1272

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

bombardier or pilot of an attacking aircraft.

Limitations:

1. Certain essential details, e.g., rate of production, usually cannot be positively established through the study of photographs alone.

2. Scale of the photographs may be a definite limitation in certain determinations.

3. Outside information is usually necessary for accurate evaluations.

4. The lack of technical knowledge may limit the analysis of the target.

d. For Air Target briefing.

Capabilities:

1. Provide detailed layout of target and target area, and information as to the relative importance of various parts of the target.

2. Provide information, ranging from general to specific, about the target which may be used in briefing notes.

3. Provide recognition features for use by the bombardier-navigator team, e.g., aiming point, landmarks, etc.

Limitations:

1. Objects are more easily recognized by color than by shades of gray which comprise the conventional black and white photograph or printed picture normally used in briefing.

2. Cannot provide complete briefing information from photo interpretation alone.

3. Often have inadequate photocoverage as both oblique and vertical photographs are usually desirable. (Oblique photographs taken on the heading of attack are especially desirable.)

e. For Air Strike Analysis.

Capabilities:

1. May provide photographs showing condition of the target at the time of attack.

2. When used in conjunction with reconnaissance photographs, are invaluable in assisting in the preparation of bomb damage reports.

3. Provide considerable information regarding the effectiveness of an attack shortly after the combat aircraft return to base.

4. Can determine the exact location of the first bomb strikes in the attack and in a general way the later strikes after the target becomes partially obscured by smoke, dust or debris.

5. Provide a means of analyzing operational problems (e.g. formations flown, bomb release, range and deflection errors, etc.), arising from a study of the attack.

6. Provide information relative to the study of weapon effectiveness.

Limitations:

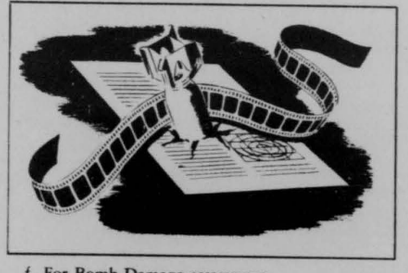
1. To prepare an analysis of damage and operational bombing efficiency through the interpretation of air attack photographs it is necessary to have supplementary information from navigators logs and ordnance records. (Bomb damage and bombing efficiency refer to different things. High bombing efficiency usually results in large amounts of bomb damage, however a negative correlation can sometimes result.)

2. Strike photographs are not sufficient for making a complete bomb damage assessment. Post strike reconnaissance photographs, ground information and other data are necessary to confirm and amplify estimates.

3. As smoke usually obscures the target shortly after the beginning of an attack, the later bomb strikes and damage cannot be accurately observed.

4. It is extremely difficult to interpret damage assessment from strike photographs. Only interpreters with long experience gained by checking strike photographs and assessments made from them against final evaluations made by using other additional data can do this type of work with any high degree of accuracy.

5. Strike photographs often present an incomplete picture as fires started in an attack may cause additional damage.



f. For Bomb Damage assessment.

Capabilities:

1. Provide information as to the amount of structural and superficial damage done to buildings, etc. in an installation, and, to a limited extent, amount of damage to equipment, etc. (Structural

1275

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

damage refers to damage which necessitates complete rebuilding or major repair effort; superficial damage refers to damage requiring such repairs as replacement of roof surfaces and minor frame members.)

2. Provide data regarding amount of time necessary to rebuild or repair.

3. Provide a guide for estimating production loss.

4. Provide data for study of weapon effectiveness.

5. Provide means for correcting or amplifying estimates made in strike assessments.

Limitations:

1. Reconnaissance photographs, except in cases of complete destruction, are not sufficient from which to make complete bomb damage assessments. Strike photographs, ordnance data, knowledge of bomb performance, ground information, etc., are necessary sources of supplementary information.

2. In event of bad weather immediately following an attack, the securing of reconnaissance photographs may be delayed which allows the enemy the opportunity to alter the appearance of the damaged areas.

3. Except in cases of complete destruction, photographs do not provide a completely accurate measure of the loss of productive capacity of industrial plants.

4. Damage to equipment as aircraft, motor transport, tanks, guns, etc., is a matter of estimation unless destruction is obvious (e.g., direct hit, fire, etc.).

5. Effect of bombing on the psychology of people, other allied industries or activities, etc., together with hitherto unsuspected results constitute important effects which are difficult to measure.

g. For Industrial and Military Activity studies.

Capabilities:

1. Provide information as to the status, extent, and scope of enemy activities, such as:

(a) Rates of industrial production (e.g., in aircraft steel, and oil).

(b) Methods, and types of construction (e.g., of large gun emplacements, and buildings).

(c) Importance of activity—to the enemy (e.g., expansion of an industry, reconstruction after bomb damage, etc. indicate effort expended and therefore importance).

(d) New developments and production procedures (e.g., new assembly methods for submarines, aircraft, etc.).

(e) Probable future capabilities (e.g., new ground defense line).

(f) True extent of damage in case of certain reconstruction activities.

2. Make possible estimates of time and effort needed in follow-up attacks.

Limitations:

1. Must have a knowledge of the enemy's industrial and structural techniques, capabilities, and resources.

2. Must have repeated comparative photo coverage.

3. Additional information from other sources is usually very necessary.

4. Must understand the psychology of the people under attack.

h. For Flak and Radar studies.

Capabilities:

1. Provide accurate pin-point locations of radar and flak defenses, and sometimes information as to the type of control employed.

2. Provide data for determining the best route of approach to targets to avoid or delay detection and anti-aircraft fire.

Limitations:

1. Detailed knowledge of the enemy's equipment and performance characteristics is necessary for proper evaluation.

i. For Radar Bombing and Navigation.

Capabilities:

1. Assist in recognition of radar returns likely to be encountered during flight to and over the target.

2. May supply considerable information about blind bombing operations.

Limitations:

1. Single photographs of radar scope images do not provide continuity between various check-points for radar navigation studies. (Note: Movies, rather than individual photographs, taken of radar scope images under actual or simulated flight provide better continuity of the radar scope images to be expected during flight.)

2. It is impossible to plot bomb impacts to any high degree of certainty using radar scope photographs, because it is very difficult to pin-point the location of the attacking aircraft at time of bomb

1274

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

release through use of radar scope photographs alone.

j. For Transportation and Communication studies.

Capabilities:

1. Can obtain a general cross-section of traffic volume from photographic coverage taken at regular intervals over transportation and communication centers, such as ports, marshalling yards, warehouses, depots, etc. This cross-section provides valuable data about the enemy's economic and military status.

2. Provide data as to the capabilities of the enemy's transportation systems.

3. Provide data for logistic planning (where it is planned to occupy an area and use certain facilities at present controlled by the enemy).

Limitations:

1. Types or kinds of supplies being transported are difficult to determine with the exception of a few bulky items as coal, iron ore, oil, timber, etc.

2. Must have continuous comparative cover taken at proper intervals.

k. For Engineer Analysis and Pre-ground Reconnaissance.

Capabilities:

1. Can aid in determining kind and amounts of equipment and materials necessary for construction or repair of airfields, landing strips, dumps, billets, docks, transportation networks, etc. (Note: These may be either those which are expected to be captured from the enemy in the future or those facilities under friendly control in remote or relatively inaccessible areas.)

2. Provide advance information on possible defense sites, communication lines, transportation facilities, etc.

3. Assist greatly in the planning accomplished by the coordinating staff members as briefly indicated above.

Limitations:

1. The amount of technical engineering knowledge available to the photo interpreter will govern the limitations of his analysis.

l. For Landing and Dropping Zone Selection.

Capabilities:

1. Determine suitable areas for operations (general and specific areas.)

2. Assist in determining the best approaches, identifying useful navigational aids, and locating enemy defenses.

Limitations:

1. For the greatest amount of information vigilant observation of an area for installation of new defenses is necessary for some time before an operation. Such continuous photographic observation may destroy the security desirable for the planned operation.

m. For Front Line Cover.

Capabilities:

1. Provide detailed picture of current enemy front lines, including such items as defenses in detail, terrain features, damage to installations, and disposition of forces.

2. Provide data regarding targets of opportunity, mobile targets, enemy movements, etc.

3. Provide extensive flak and gun battery data.

Limitations:

1. Cover is normally requested for use by the ground forces and of immediate interest to them, while possibly of no immediate value or interest to the air force.

2. Area covered is limited in depth and therefore limited in air force photo interpretation interest, except to tactical air forces used for direct ground support.

n. For Navigational Aids, Check Points, and Landfall Strips.

Capabilities:

1. Provide annotated or recognition photographs of various landmarks or check points along a planned route.

2. Provide landfall recognition strips for air force navigators, amphibious assault forces, etc.

3. Annotations can be added to photographs to facilitate coordination with maps.

Limitations:

1. Coverage limited to pre-determined areas.

2. Frequently not possible to have adequate coverage for long range missions.

3. Aids are of no value if off course.

o. For Special Combat Operations.

Capabilities:

1. Possible to determine approximate water depths adjacent to beaches by observing wave characteristics, by stereoscopic study, and by the use of color photography under special conditions.

2. Possible to determine beach characteristics (sand, cobblestone, mud, etc.), and at low tide, underwater obstacles.

1275

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

3. Soil conditions may be determined by the geologic, vegetative, and topographical characteristics of an area.

4. Speed of moving ships may be determined by characteristics and spacing of bow waves.

Limitations:

1. Need advanced mathematics and technical knowledge of geology and ecology.

2. Special photographic equipment, special film, and precise flying may be necessary.

3. Photographs for stereographic determination of water depths must be taken when the water is clear enough to allow the bottom to be seen.

p. For Verification of Reports.

Capabilities:

1. Frequently possible to check the reliability of reports made by agents, collaborators, or prisoners of war; hence, able to determine the reliability of the reporting agent himself.

2. Frequently possible to verify or refute specific items of information provided by agents, collaborators, or prisoners of war.

3. Photographs used as reference during an interrogation usually make possible the collection of both a greater amount and more accurate information than when the person being interrogated relies solely on his memory.

Limitations:

1. Photographs used must have been taken at the proper time to show the subject matter in question.

2. Subject matter being checked must be of such a nature that there will be visible evidence on a proper photograph.

PHOTO-INTERPRETATION STUDIES

Photo interpreters study photos in detail and report on all installations and activities seen. This is sometimes known as direct view. In addition, interpreters report not only what they see and identify, but also what they can tell from "indications" and "associated features." For example, they might not be able to see a supply dump, but because of the "associated features" of tracks, roads or trails leading into a forest the types of trucks occasionally seen on these trails, and by the elimination of their possible areas in the immediate vicinity, the interpreter would still be able to point out the dump location.

The majority of photo intelligence is obtained by a comparative study of photos taken of the same objective at regular intervals. The first look at an airdrome, a defense installation or a harbor may not mean too much, but as the photo interpreter studies the pictures of the same objects at daily, weekly, or even monthly intervals and compares the notes of changes and development, he can begin to come to a conclusion as to what is going on in enemy territory. Comparative study is the most significant tool in the hands of the photo interpreter, and is the very life blood of photo intelligence.

Under comparative study, exploratory work should be included. This method of study can be of two types. By the first type, the photo interpreter, after preparing his report on a particular item (i.e., railroads, bomb damage, rocket sites, etc.) takes the same photographs and proceeds to analyze the photos in their entirety. He will, by comparing previous coverage with the current photographs, note if any changes have taken place in any locality. If so, a reconnaissance mission may be assigned to take pinpoint photographs of the area. The second type is initiated when a report comes in from some source other than photo interpretation, such as combat crew reports, escapees, ground agents, etc. If current coverage does not reveal the enemy's installation as reported, a photo reconnaissance aircraft may be sent to look for the installation, its photos interpreted, and the information verified or refuted.

GLOSSARY OF TERMS USED IN PHOTO INTELLIGENCE

Cameras used in taking photographs for photo interpretation are generally of two types, aerial and recording:

a. Aerial cameras are made with a wide variety of focal lengths, angles of coverage, and types of shutters which directly affect qualities of the resulting photograph and their usefulness in photo interpretation.

b. Recording cameras are those used for photographing from a fixed position the images on the radar scope or television screen.

Types of aerial photographs vary both with the manner in which the photograph is taken, and the means employed:

a. Vertical Photographs are those made with the optical axis of the camera as nearly vertical to the surface of earth as possible.

b. Oblique Photographs are those made with the optical axis of the camera tilted from the vertical.

1276

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

c. Strike Photographs are those taken by cameras in combat aircraft at the time a target is attacked; they give some indication of the effectiveness of the operation.

d. Reconnaisance Photographs are used to make maps or charts or to obtain information on the results of bombing or on enemy movements, concentrations, or activities. (They do not include strike photographs.)

STEREO-PAIR.—Two photographs (either verticals or obliques) taken from the same general elevation or location and from adjacent positions. When the overlapping area on the pair is examined stereoscopically the effect is one of actual relief, showing length, breadth, and depth. (This overlapping coverage is called stereoscopic coverage.)

SCALE.—The relationship between a distance on a map or photograph and the actual distance on the ground is called scale. It may be expressed graphically or as a ratio called the representative fraction (RF). The scale of an aerial photograph is established by the focal length of the camera lens used and the altitude of the camera at the time of exposure. Scale affects the degree of interpretation possible because the larger the scale, the greater the visible detail. The scale of a photograph must be determined before the size of any object on it can be measured. The scale of aerial photographs can be determined in the following ways:

a. FOCAL LENGTH AND LENS HEIGHT METHOD.—The RF of a photograph is the focal length in inches divided by the altitude in inches above the ground. For example, if the focal length of the camera is 24 inches and the altitude of the camera above the ground is 30,000 feet, the RF of the photograph is found by the formula:

$$RF = \frac{\text{Focal length of camera in inches}}{\text{Altitude of camera above the ground in inches}} \text{ or } \frac{F}{H}$$

Then RF is $\frac{24}{30{,}000 \times 12} = \frac{1}{15{,}000}$ or 1:15,000

If the focal length were 6 inches, RF $= \frac{6}{30{,}000 \times 12}$ or 1:60,000..

The altitude indicated on the margin of an aerial photograph is given in feet above mean sea level. Therefore, the elevation of the ground must first be subtracted from the sea level altitude before using this equation.

b. COMPARISON WITH A MAP.—Select two points on the photograph (such as crossroads or road junctions) that can be easily located on a map of the same area. A line between the points should pass as near the center of the photograph as possible, with the points about the same distance from the center of the picture and at approximately the same elevation. By scaling the distances between the identical points on both the map and photograph the RF can be obtained by

$$RF = \frac{\text{Photo distance}}{\text{Ground distance}}$$

For example, if the distance between two points along a line on the photograph is 8 inches, and the scaled ground distance from the map between the same points is 8,000 feet,

$$RF = \frac{8}{8{,}000 \times 12} \text{ or } \frac{1}{12{,}000} \text{ or } 1{:}12{,}000$$

c. COMPARISON WITH THE GROUND OR A KNOWN OBJECT.—Select two points on the photograph which are accessible on the ground. Measure the distance between the two points on the photograph and the actual ground distance between the same points. By the RF formula, if the distance on the photograph is 9 inches and the measured

1277

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

ground distance is 4,000 yards, the RF of the photograph is

$$\frac{9}{4{,}000 \times 36} \text{ or } 1{:}16{,}000$$

This same procedure may be followed, but with a lesser degree of accuracy, using the dimensions of an object such as the wing span of an identified aircraft or the length of a known vessel.

MARGINAL DATA.—The information which appears on the margin of photographic prints includes geographic location, altitude in feet of aircraft above sea level, focal length of camera used, and the time and date of photography.

PRINT PAPER.—The paper on which photographs are printed may be either glossy (slick), velvet, semi-matte (rough), or matte (very rough). The finish depends on the type of paper used, and finishing methods. Velvet finish, which gives the clearest definition of detail, is ordinarily used for photo interpretation.

RECONNAISSANCE STRIP.—A series of overlapping photographs made from an aircraft flying a selected course. These strips are usually vertical photographs with a minimum overlap of 60 percent of the successive exposures forming the strip. Where two or more strips are necessary to cover a given area, a lateral overlap between strips is also necessary. Oblique reconnaissance strip photographs may be made in similar fashion.

UNCONTROLLED MOSAIC.—An assembly formed by joining several overlapping vertical photographs taken at different camera positions. The term is generally applied to an assembly of one or more vertical strips. When the several photographs are oriented with respect to each other, the result is an uncontrolled mosaic. This provides a good pictorial representation of the ground but has errors in scale and azimuth.

CONTROLLED MOSAIC.—A mosaic formed by combining several photographs of a uniform scale, oriented with respect to one another and fitted to points of ground control. The accuracy of a controlled mosaic used as a map depends upon the quality of the photography, and the character and amount of ground control, and the methods used in preparing it.

PHOTO MAP.—A reproduction of a photograph or mosaic upon which grid lines, marginal data, and place names are added. They may be reproduced in quantity by photographic or lithographic methods.

Photographic Faults adversely affect the detail which is a primary interest of the photo interpreter. Detail depends upon the definition of the lens, the resolving power of the film, the atmospheric conditions at time of photography, the correct exposure and development of the film and the contrast in tones on the photograph. Any condition of the camera or treatment of the film during processing and printing which causes detail to be obscured or diminished is detrimental to the interpretation of photographs.

VECTOGRAPHS.—Prints or slides in which two images of a stereo-pair are superimposed with slight off-set so that each image transmits or reflects light polarized in a plane perpendicular to that of the other. The print or projection must be viewed with polarized glasses so that the plane of polarization in each corresponds to that of the image each eye is required to see, this giving a three dimensional effect. Vectographs are of negligible value to the photo interpreter in interpreting aerial photographs. They are a rapid means of presenting the three dimensional quality of a stereopair to individuals unaccustomed to using a stereoscope or to a group of persons simultaneously.

It is expected that this kind of intelligence will be required to reach proper authorities in much less time than ever before. It is conceivable that adequate equipment and arrangements can be made for an interpreter to accompany the photographing plane and to get required intelligence transmitted over thousands of miles in a few hours time after photographs are taken. The photographing plane might be equipped with a photo lab sufficient to produce pictures in a few minutes. Advanced and specialized interpretation instruments may greatly simplify the necessary techniques of interpretation. Intelligence so obtained could be radioed back for proper use, and subsequent missions sent out without the delay which interpretation at the home base necessitates.

INTERPRETATION AND USES OF RADAR SCOPE PHOTOGRAPHS

Introduction

A conventional photograph of a landscape shows that landscape as it appears to the human eye, but the photograph of a radar scope of that same landscape shows it according to the manner in which various objects reflect radar impulses. In general, the latter result is a map-like image of certain features. However, this similarity may be difficult to recognize or identify except where the area pictured contains a stream or shore line of appreciable

1278

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

size which has definite shape characteristics. Because of these peculiarities, and also the distortions which occur, detailed interpretation of radar scope photographs should be done only by personnel especially qualified for the task. However, all those who have contact with this type of photographs in their duties should be aware of the problems involved in their use, and have at least an elementary knowledge of how to interpret and plot them.

Kinds of Photographs and Uses

There are two kinds of radar scope photographs: Stills and movies. Stills show the appearance of the radar scope during a specific time period (preferably that time required for the sweep to make one complete revolution) while movies present a continuous picture of the changing images on the screen as the plane progresses along its route. The uses of such photographs are limited to briefing radar navigators and radar bombardiers and to making calculated bomb fall plots. Such uses are obviously closely allied to operational problems involving recognition of landmarks or target areas and estimating bombing efficiency. Other uses such as for detailed target analysis and bomb damage assessment are definitely beyond the capabilities of such photographs.

Characteristics of Radar Photographs

A radar set in an aircraft transmits beamed radar energy. When this energy strikes a surface at right angles to the beam, part of the energy is reflected back to the plane causing the P.P.I. (planned position indicator) screen to brighten up. The size, location and shape of the spot on the screen corresponds to the object which returned the radar energy. Water and other horizontal smooth surfaces reflect very little energy back to the plane (except when directly below the plane) while such objects as cities which have many reflecting surfaces transmit back considerable energy. As a result water areas show dark and cities, bridges, mountains, stream banks, etc. are indicated by bright areas on the screen. Therefore, the object on the ground must be identified by the size and brightness and location of the return.

Identification of such items as coast line areas, ships at sea, and coastal cities is relatively easy. However, difficulties arise in identifying locations when the area shown on the screen does not contain a large and easily recognized body of water. So unless the location of overlapping photographs is carefully plotted, it is very easy for even a highly skilled interpreter to become "lost." There is no substitute for experience in interpreting radar returns.

Generally, the return from a large city will start to break up into smaller pieces at a distance of 10 to 20 miles. Persistently bright areas are usually caused by storage areas, factories, oil farms, warehouse areas around docks and railroad yards, marshalling yards containing rolling stock, hangars on airfields, etc. Non-persistent areas – areas which become bright or dim as the reflection angle varies–may be residential or business districts; while parks, cemeteries and dumps usually give no return. In order to properly interpret photographs of such areas for target studies, careful study of all available maps covering a city is a necessity. Radar scope photographs may be classified according to the area which they cover. When navigation is being performed, the set is usually operated on 50 or 100 mile scan. This means, in the case of a 50 mile scan, that the image on the screen represents the area included within a radius of 50 miles from the plane. When a plane is on the bombing run the scan may be switched to a scan of 20 miles or less as this permits greater definition of detail in the target area.

There are also superimposed on the PPI scope certain features which aid greatly in the study of the scope photographs. The scope is usually coupled to the flux-gate compass so that the top of the resulting photographs are oriented to the north, and a heading (or lubber) line indicates the direction of flight. In addition to these two aids, range lines (concentric circles, one, five or ten miles apart) are usually shown which permit the calculation of distance from the aircraft (which is located over the center of the photograph).

Inherent Errors

As indicated in the preceding paragraph the returns from a certain area will vary according to the reflecting surfaces. Not only do these surfaces cause varying returns as the plane moves along its route, but as the sets are not stabilized, the returns will vary as the longitudinal and lateral axis of the plane vary in relation to the surface of the earth (tilt and climb). These may cause a great deal of trouble in identification.

In addition to these very considerable problems, there are the following causes of distortion:

a. AZIMUTH ERROR DUE TO BEAM WIDTH: If the radar beam has a width of three degrees a point reflector (i.e. a small boat) will appear as an object three miles long at 60 miles (or one mile at 20 miles). Width error manifests itself in various ways and amounts.

1279

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

b. RANGE ERROR DUE TO RADAR PULSE LENGTH: If the pulse of radio energy is .5 (.5/1,000,000) microseconds long this pulse wave will have a length about 500 feet, and as it takes this wave 12.4 microseconds to go and return one mile, this factor will cause an apparent increase in the width of some objects of about 250 feet. This error will be obvious under some conditions and not under others.

c. RANGE AND AZIMUTH ERROR DUE TO SPOT SIZE: The electron beam from the cathode ray tubes in the radar has a diameter of about 1/30 inch on the face of the average screen, and it is this beam which "paints" the picture on screen. If a set is operating on a 20 mile scan, 1/30 inch represents 1800 feet. A point reflection will appear to be 1800 feet long and 1800 feet wide. Therefore, if two separate points are to be visible on the screen they must be over 1800 feet apart.

When it is recognized that different objects cause returns of varying size, shape and brightness, and that these returns are then distorted by the beam width, pulse length, and spot size, it becomes obvious that the interpretation of radar scope photographs can best be done by a skilled specialist. However, anyone who has the time and patience to study these peculiarities can probably become reasonably proficient in interpretation.

Methods of Plotting and Requirements for Bomb Plotting

The accurate plotting of the course of a plane from radar scope photographs is often difficult. As has been pointed out the location of a pin-point location on a photograph can be difficult. To this problem, the plotter must add that of finding reference points in the proper areas to enable him to make an accurate plot on a map. The mechanics involved are the same as for location by intersection and great circle methods in plane table mapping. The same principles apply and the same requirements must be satisfied to obtain an accurate location. Unfortunately, the photographs to be plotted do not always supply reference points in the proper locations for highly accurate work and in some areas the problem of scarcity may be added to that of lack of proper location. And if the part of the world covered by the photographs does not have adequate or accurate map coverage, then the plotter will be confronted by still another major difficulty.

On a radar bombing mission, determination of the route flown and the general area where the bombs were dropped are the two items of greatest importance. While approximate locations may be satisfactory for route determination, precise location of the point of bombs away is necessary if the bomb fall plot is to be reasonably accurate. This requires a "clear" photograph as soon after bombs away as possible, and that that photograph be positively identified. (One method is mount a small light where it will show in the corner of the photograph and connect it so that it will be lit when the bombs are released.) Also the set should be switched from short (20 mile) or sector scan back to 50 or 100 mile scan just before bombs away otherwise the photograph will probably lack adequate points for plotting. If this photograph can be plotted accurately and the operational data relating to speed, altitude, etc. is complete then a satisfactory plot should result. The most serious problem is that related to finding the geographical location of the plane the instant the bombs were released.

Television Photography

A television screen may be photographed in the same manner as a radar screen; and, in general, the same uses may be made of the photographs which result as with radar scope photographs. Television has an advantage over radar in that the visual image is the same as it appears to the human eye. Television offers the possibility of transmitting visual (or radar) information back from a drone (or guided missile) to a "mother" aircraft, and thus provides a method of securing photographs from a drone or missile.

Questions and Leads for Classroom Discussion

1. What is the classification of photo intelligence as to source and dependability?
2. What are four capabilities of photo intelligence when applied to general military use? What are four limitations?
3. Name six specific uses for photo intelligence.
4. What is meant by "indications" and "associated features" in photo interpretation?
5. What is a comparative study?
6. What is the difference between vertical and oblique photos?
7. What is the difference between high and low oblique photographs?
8. What establishes the scale of an aerial photograph?
9. In what respect does a controlled mosaic differ from an uncontrolled mosaic?
10. What are the two kinds of radar scope photographs?
11. What is the advantage of television over radar?

CHAPTER XIII
ELECTRONICS INTELLIGENCE

Electronics intelligence is derived from information concerning the following: Enemy radio and wire communication systems; enemy navigational aids employing radio and radar; enemy radar detection, fighter-control, and gun-laying systems; any other enemy radiation subject to intercept and analysis.

Electronics intelligence must be compared with visual data. For example, the check-points that appear on PPI scope photographs made on a radar bombing strike must be correlated with visual photographs of the same features.

Because electronics information is technical, communication officers, particularly those specializing in radio counter-measures and radar equipment, cooperate with intelligence in collecting, collating, and evaluating it. The final interpretation of electronics information and the distribution of the resultant intelligence are functions of the A-2.

The following kinds of electronics information are commonly sought:

a. Enemy radio. General information:

1. Content, types, origin, and dates of messages.
2. Locations and frequency assignment of stations.
3. Methods of operating radio links.
4. Radio equipment; ranges and uses.

b. Enemy radar. General information:

1. Radar locations and frequencies.
2. Coverage of enemy system as a whole and of individual sets when possible.
3. Radar equipment; ranges and uses.
4. Types and uses of airborne radar.

c. Enemy tactical uses of electronics:

1. Air interception methods and equipment.
2. Fighter direction and ground-controlled interception.
3. Early-warning systems.
4. Systems for anti-aircraft artillery fire and search-light control.

1281

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

5. Systems for aircraft fire control.
6. Guided missiles.
7. Radar bombing equipment and methods.

d. Enemy uses of electronics in navigation:
1. Aircraft.
2. Shipping.

e. Enemy radio countermeasures:
1. PPI scope photos of enemy areas.

SOURCES OF ELECTRONICS INFORMATION

Sources of information concerning enemy electronics include:

a. Interrogation of air crew members, particularly radar and radio operators.

b. Reports of radio countermeasure (RCM) reconnaissance missions flown by "ferret" aircraft.

c. Intercept reports from:
1. Radio squadrons mobile (Air Force).
2. Radio intercept companies (Signal Corps).

d. Captured electronics equipment reports from:
1. Air technical intelligence teams (Air Force and Navy).
2. Enemy equipment intelligence service teams (Signal Corps).

e. Photographic reconnaissance.

f. Reports from Army and Navy intelligence officers on visual sightings of electronics installations and related information.

g. Captured documents.

h. Interrogation of prisoners of war, evaders, escapers, and repatriates.

i. Reports of special agents in enemy occupied or neutral territory.

j. PPI scope photographs studied by photo interpreters.

AIR FORCE RADIO SQUADRON MOBILE

This mobile organization assigned to the Air Force provides all the radio intelligence facilities except the security monitoring of radio sets and radio countermeasure (RCM) missions, which are flown by "ferret" aircraft. Normally one mobile radio squadron is assigned to each combat air force. The A-2 of the air force designates its missions, which include operating radio interception and direction-finding stations, making crypto-analyses and evaluating intelligence.

DUTIES OF RADAR INTELLIGENCE OFFICERS

Radar intelligence officers, who are specially trained in communications, handle electronics intelligence in the field. They are needed because of the amount of technical knowledge required to operate radio and radar equipment. The intelligence sections of all group and higher Air Force headquarters must have, in addition to these specialists, officers skilled in the collection, processing, and dissemination of electronics intelligence.

In a theater, complete electronics intelligence is normally obtained by delegating different functions to each air echelon. On command, air force, corps, division, and group levels these functions may be distributed in the following manner:

The command, air force, corps and division radar intelligence officers are to:

a. Keep in touch with all sources of electronics information, collect and process information, and disseminate it to higher, adjacent, and lower echelons through the A-2 of the command.

b. Assist operations and intelligence officers in planning radar bombing runs and selecting radar check points.

c. Supervise the preparation of briefing material for target folders, giving such information as location and coverage of enemy aircraft early-warning system and method of fire control and air interception.

d. Prepare electronics intelligence section for mission reports.

e. Recommend coverage for radar-scope photographs and supervise filing and interpretation of such photographs.

f. Assist A-2 in supervising electronics intelligence in lower echelons.

g. Plan and supervise radio countermeasures as directed.

In a division, the duties of the radar intelligence officer are determined by the position of the division in relation to corps headquarters. When the division is near corps headquarters, the radar intelligence officer may do liaison work only, assisting the corps intelligence section and screening and summarizing information. When the division is isolated from corps headquarters, electronics intelligence is handled as it is in the command.

In an air corps, the radar intelligence performs

1282

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

only liaison work if the corps is near the headquarters of the air force. If it is isolated from headquarters, electronics information is handled as it is in the command.

The radar intelligence officer when in a group merely carries out the plans of higher headquarters. He questions crew members, reports missions, and briefs radar and radio personnel on electronics intelligence.

Questions and Leads for Classroom Discussion

1. Must Electronics Intelligence be compared with visual data?
2. Whose cooperation is necessary in collecting this type of intelligence?
3. What kind of information is frequently sought?
4. What are sources of electronics information?
5. What is a radio squadron mobile?
6. Explain the duties of a radar intelligence officer.

CHAPTER XIV

CAPTURE INTELLIGENCE

PRISONER OF WAR INTERROGATION

Capture Intelligence is gained from examination and analysis of captured aircraft equipment and documents and from interrogation and examination of prisoners of war. Additional intelligence is obtained from the interrogation of deserters, repatriates to our own forces, travelers, evacuees and members of the local population. All of these classes are interrogated and some of the latter may actually be prisoners of war and are handled as such under the rules of war.

Valuable information is derived from the examination of maps, sketches, photographs, orders, tactical and technical manuals, code books, war diaries, newspapers, notebooks, service records, pay rolls, uniform and individual equipment, post cards and letters, records of headquarters, post and telegraph offices, telephone exchanges, banks, police stations, municipal and government offices.

Air technical, air prisoner of war, and air interpreter-translator specialists are especially selected and trained for the exploitation of capture intelligence.

Special Identity Cards. Each officer of the Capture Intelligence Branch and its field units operating in combat areas must be furnished with a special identity card and letter of authority, signed preferably in person by the senior area commander, directing all subordinate commanders to render him such assistance as may be required, consistent with their own mission, in the safeguarding and necessary movement for intelligence exploitation of captured air personnel, equipment, and documents. Officers must be very discreet in the use of this special authority, and will, whenever practicable, utilize Air Force troops in preference to ground or naval forces. Combat troops temporarily guarding captured air personnel, equipment, and documents, will be relieved as quickly as possible.

Capture Intelligence Branch (Command or Air Force), A-2 Division, coordinates the functions of

1284

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

the Air Technical Intelligence Section, Air Interpreter Translator Section and the Air Prisoner of War Interrogation Section. The Chief of this Branch is an assistant intelligence officer responsible for coordinating all capture intelligence collecting agencies.

The Chief of the Air Technical Intelligence Section is responsible for the exploitation of Air Technical Intelligence, for operation of the ATI Section and control of ATI Field Units.

The Chief of the Air Prisoner of War Section is responsible for interrogation of captured enemy air personnel, and the exploitation of captured documents, and for operation of the APW Section. The Chief of the Air Interpreter Translator Section is responsible for exploitation of intelligence through translation of foreign documents, for supply of interpreters and translators of foreign languages for intelligence purposes, and for operation of the ATI Section.

AIR PRISONER OF WAR INTERROGATION

The interrogation of captured enemy air force personnel is a valuable source of intelligence during wartime. It furnishes current and detailed information on the enemy air force order of battle, and supplies intelligence for combat operations, economic warfare, psychological warfare and target information. Intelligence information obtained from the interrogation of air prisoners of war (APW's) must be evaluated and checked against other sources before it can be accepted as fact. The intelligence section of the highest echelon in a combat theater has access to the enemy sources of information necessary to verify the accuracy of interrogation results. Agencies issuing reports based on PW interrogations indicate the reliability of source and the information by the use of a code as listed in Chapter VIII.

Air Prisoner of War Interrogation in Combat Theaters

Air Prisoner of War Interrogation units are organized by direction of the Director of Intelligence, for duty with the command or air force as is dictated by combat conditions and the potential amount of air prisoners available in a combat theater.

In the combat theaters an Air Prisoner of War Interrogation Section is organized in the intelligence division of the highest command or air force in each theater.

The APW Interrogation Section is charged with the exploitation of captured enemy air force personnel and documents throughout the geographical area of the command or air force and such other areas as directed. The APW Interrogation Section organizes, controls and supervises APW Field Unit(s) which in turn furnish APW teams according to the demands of the local tactical situation. APW teams organized along similar lines as Air Technical Intelligence teams, are attached to forward tactical units, assault forces or task forces for the purpose of interrogating and examining enemy air personnel and documents at the site of capture.

THE THREE MAIN TYPES OF INTERROGATION

Forward or Tactical Interrogation

Forward or Tactical Interrogation, conducted by the APW Teams and Field Units is concentrated on tactical information of enemy air units opposing our tactical forces in the field. Because the interrogator is aided by information which may be in or on a crashed airplane, it is desirable that the preliminary interrogation be held at the location of the crash if it does not cause delay. The necessity for speed is the governing factor. The result of this preliminary interrogation is disseminated in the form of flash reports by the most rapid means available. Further and more detailed interrogation is carried out by the APW Field Unit when the situation warrants.

Detailed or Strategic Interrogation

Detailed or Strategic Interrogation, conducted usually at an Interrogation Center which is located in the rear of a combat theater or in the Zone of Interior, depending on the overall situation. Captured personnel of high rank or having additional knowledge are transported from forward areas by rapid means to the Interrogation Center for detailed interrogation on strategic and technical information.

Interrogation on Target Information

Interrogation on target information is conducted at all stages of interrogation and at all levels of command. Deserters and repatriates, evacuees, and local civilian populations, ground and naval prisoners of war, who may possess information of interest to our air forces, are also interrogated as sources of target information. Results of this interrogation may furnish information on tactical as well as strategic air targets.

SEGREGATION AND HANDLING OF AIR PRISONERS OF WAR

Complete examination of enemy air personnel by untrained officers and enlisted men accomplishes no useful purpose and delays and probably frustrates

Signature of Bearer

The bearer of this card who will further identify himself with military credentials (AGO card with photo, etc.) is engaged in Air Technical Intelligence or Air Prisoner of War Interrogation missions under orders of this headquarters.

In the performance of his duties, he is entitled:

To travel in service or civilian transport anywhere in the area under control of his headquarters.

To examine enemy personnel, materiel, and documents, to photograph and to take custody of captured personnel, materiel, and documents, against receipt, on application to the officer in whose charge they are.

All service authorities are requested to assist the bearer in the discharge of his duties in every way practicable, consistent with the military situation, including the provision of rations and accommodation; fuel, oil, and emergency automotive repairs; emergency transportation; and the provision of guards for captured personnel, equipment, and documents.

The bearer of this card will not be interfered with in the performance of his duty by the military police or any other military organization.

Not valid unless produced in connection with AGO Card

later examination by trained interrogation personnel. The information derived from enemy air crews is of vital importance to air force commands. Crews of enemy aircraft usually have little information of value to ground force units. The handling and interrogation of captured air personnel is a highly specialized function and is conducted by officers and enlisted men especially trained for this purpose, who have technical and linguistic backgrounds. Directives for handling air prisoners of war are issued by the theater air commander and the duty of unit intelligence officers is mainly that of seeing that these instructions are followed by all personnel.

All captured air personnel, with the exception of anti-aircraft and airborne troops (including paratroops) whose principal function is ground combat and defense, will be segregated upon capture. All captured personnel will be searched and all papers, maps and other documents will be removed and inventoried. These documents and individual inventories will be transmitted to designated interrogation personnel with the prisoners by the guards. Every effort will be made to prevent enemy airmen from destroying aircraft, equipment, and documents. Captured air crews will be individually segregated, and kept in confinement without communication with each other until turned over to properly designated air interrogation personnel. Units capturing aircrews together with their aircraft will make an Air Crash Report. Where air crewmen only are captured, especially those landing by parachute, the individual and/or air, ground, or naval unit effecting the capture is responsible for reporting the capture to the nearest air unit or command by the fastest means available. The air unit will assume custody of captured personnel, inventory of documents and the documents, and notify the nearest Air Prisoner of War Interrogation Team or Field Unit by telephone, radio, or telegraph.

Badges, medals, ribbons, insignia, and documents, especially theater and railroad ticket stubs, personal letters, cards, diaries and memoranda, found on prisoners, may be highly significant and of invaluable aid to the trained interrogator. These items will be listed on the inventory of personal effects taken from each prisoner. Rank insignia, and embroidered or sewn insignia or ribbons on the uniform, will not be removed from the prisoners' clothing and will be listed as not removed on the inventory. The military disposal or return of personal effects to individual prisoners will be made only by properly designated interrogation personnel, in accordance with existing policies and directives.

Questions and Leads for Classroom Discussion

1. What are specific sources of capture intelligence?
2. What functions are coordinated by the Capture Intelligence Branch at Command or AF Headquarters?
3. What information is gathered by Air Prisoner of War interrogation?
4. What are the three main types of Prisoner of War interrogation?
5. Discuss briefly the segregation and handling of Air Prisoners of War.

THIS PAGE IS UNCLASSIFIED

CHAPTER XV

AIR TECHNICAL INTELLIGENCE

GENERAL

Information obtained through Air Technical Intelligence (ATI) channels provides vital data on characteristics, performance, vulnerability, field of fire, and recognition of enemy aircraft. It supplies intelligence for combat operations, economic warfare, and target information, and leads to improvement of domestic designs and to the development of counter-measures against new enemy equipment. Examination and tests of captured equipment reveal new enemy design and engineering trends, and assists materially through name plate and other analysis in the estimate of enemy production.

The central Air Force agency responsible for air technical intelligence activity is the Air Materiel Command (AMC). Among other specific missions, the Commanding General of AMC is charged with the operation of the Technical Intelligence Services of the U. S. Air Forces, and with the training of Air Technical Liaison Officers. Within AMC, direct responsibility for technical intelligence is placed in the Technical Intelligence Division of the command. This Division is staffed with trained technical personnel and the laboratories and other facilities of the Engineering Division of the Command are available for research and analysis.

The Technical Intelligence Division directs the training of ATI personnel for assignment throughout the United States Air Forces. It publishes and disseminates air technical information and technical manuals for the guidance of personnel in the field. It directs the collection of air technical intelligence throughout the world, utilizing the military air attache system, foreign observers, and the intelligence staffs of combat and service units.

Technical intelligence from the field is channeled into AMC for final analysis and evaluation by the Technical Intelligence Division. Foreign air equipment and documents examined by field units are forwarded to AMC for further intelligence exploitation and test when advisable.

Technical Intelligence specifically endeavors to

1289

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

maintain up-to-date data on all actual or potential foreign air materiel including:

a. Performance and characteristics.

b. Quality of workmanship and materials.

c. Raw material sources.

d. Recognition features.

e. Design and construction.

f. Maintenance and supply, including facilities.

AIR TECHNICAL INTELLIGENCE FIELD OPERATIONS

In order to exploit Air Technical Intelligence in the combat theaters or areas, technical specialists are attached to the command or Air Force by Air Materiel Command through Headquarters, USAF. Air Technical Intelligence Units are organized by Air Materiel Command for duty with the command or Air Force as dictated by combat conditions and the potential amount of Air Technical Intelligence available. Individuals are also attached by AMC through Headquarters, USAF as Air Technical Liaison Officers to the Air Attache Offices abroad and to duty with friendly armed forces.

In the combat theaters an Air Technical Intelligence (ATI) Section (formerly called TAI Unit) is assigned to the (A-2 division) highest command or numbered air force in each theater. ATI Sections are organized in peacetime for training purposes.

The ATI Section is charged with the exploitation of all Air Technical Intelligence throughout the geographical area of the Command or Air Force to which it is assigned and such other areas as directed.

As ATI Sections are organized to meet the requirements of the combat situation, a very flexible Table of Organization has been compiled to cover the organization. Assigned to the ATI Section will be one or more ATI Field Units consisting of a mobile Headquarters Unit and a varied number of ATI Teams depending upon locations and operating requirements.

ATI must be organized on an area basis to function effectively. Enemy Aircraft may be shot down anywhere within their radius of action and each geographic area must be under the jurisdiction of air, ground, naval and allied forces. In large geographic areas having two or more numbered Air Forces under an Air Command, the normal area of jurisdiction of each numbered Air Force is seldom exact.

If the area is not too large and land communication facilities are good, one ATI Section with an Air Command may be sufficient. Theater directives should clearly indicate that this Section has responsibility throughout the theater.

Where the geographic area is too large to be handled effectively by one ATI Section, one may be organized in each Air Force. Areas of responsibility between the different ATI Sections must be clearly indicated in theater directives.

When Naval Air Units are present, Naval and USAF ATI personnel should be organized into a joint[1] command ATI Section under either Naval or USAF air commanders. When allied forces are involved in the area, they are frequently utilized in the Section, which then becomes a combined section.[2]

ATI Field Units will be attached to the nearest tactical unit when operating in forward areas for rations, quarters, and necessary guard facilities. ATI Teams operate from the field unit and will be completely self sustained. All administration, communication, and other services will be furnished by the field unit, which operates directly under the jurisdiction of the A-2 of the Command or Air Force. ATI Teams may be *attached* to combat units in assault for airborne or amphibious operations for transportation purposes only. The Chief of the Air Technical Intelligence Section will assign the particular areas in which the field units will operate. The operations officer of each Field Unit will be responsible for the movement and control of the ATI Teams of his unit within the area assigned to the unit.

Each ATI Field Unit consists of a headquarters unit and the required number of ATI Teams. The field unit will furnish the necessary supply and service functions for the ATI Teams assigned, i.e., (communications, photography, reproduction, and minor vehicle repair and service), it will also serve as the collection point for all information gathered by the ATI Teams prior to the forwarding to higher echelons.

The ATI Team usually consists of two technically trained officers with mechanical ability who actually investigate the enemy air materiel. The team is completely mobile and self-contained and carries its own rations, tools, radio, and other equipment required for investigations. It can operate for extended periods of time away from the field unit, and is

[1] A "joint command" is composed of personnel of two or more services, i.e., air, ground, and naval.
[2] A "combined command" is composed of personnel of two or more allied nations.

1290

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

ordered from location to location as assigned by the field unit operations officer, with whom daily radio communication is maintained. The field team conducts a complete investigation of enemy air materiel at the site of capture for intelligence purposes and items of further engineering value are shipped to Air Materiel Command for further test and analysis. The personnel of the ATI team must be qualified for extended field duty under combat conditions and must have a complete knowledge of the latest developments of aeronautical equipment and weapons.

FUNCTIONS AND RESPONSIBILITIES OF AIR TECHNICAL INTELLIGENCE ORGANIZATIONS

Technical Intelligence Division of Air Materiel Command

a. Receives and catalogues actual or potential enemy air equipment and other technical information.

b. Train Technical Intelligence personnel for the USAF.

c. Evaluate and analyze intelligence reports having to do with foreign (actual or potential enemy) air equipment.

d. Conduct or arrange for tests to be made on foreign air equipment.

e. Interpret and reproduce photos of foreign air equipment.

f. Prepare and disseminate Air Technical Intelligence reports and summaries as may be needed during peace or war.

g. Rebuild and distribute foreign air equipment as needed for training purposes.

h. Reproduce sketches and models of foreign air equipment.

i. Prepare and distribute directives concerning the collection, crating, tagging and shipping of captured or other foreign air equipment.

Air Technical Intelligence Section (Command or Air Force)

a. Coordinate all Air Technical Intelligence activities in the theater of operations (or assigned geographic area).

b. Supervise activities of Air Technical Intelligence Field Units and teams.

c. Analyze, examine and evaluate foreign air equipment, technical data and reports from ATI Field Units and Teams and other sources within the command.

d. Issue as required periodic Air Technical Intelligence Summaries.

e. Advise and assist A-2 in preparing Air Technical Intelligence directives and SOPs for inclusion in theater directives for the information and guidance of all military personnel.

f. Prepare and forward to the AMC in the Zone of the Interior:

1. Captured air equipment, technical documents and related information, which in the opinion of A-2 should have further analysis, or be of interest to AMC.

2. Collect and ship items specifically requested by AMC or other proper authority.

Air Technical Intelligence Field Unit

a. Organized and equipped as a mobile unit capable of operating in forward area, provide supply and service functions for Air Technical Intelligence Teams.

b. Control the operation of ATI Teams, maintain communication with teams and ATI Section of A-2.

c. Consolidate, analyze and augment activities of individual teams and maintain reproduction facilities for information being forwarded to higher echelons.

d. Compile consolidated ATI reports for ATI Section from information received from ATI teams. (Make such other immediate distribution of reports as required by theater ATI, SOP and directives.)

e. Collect, consolidate and forward all document manuals and other technical data received from ATI Teams to ATI Section A-2.

f. Prepare selected foreign air materiel and direct crating or shipment to the Zone of Interior in coordination with A-2 of the air force or command.

g. Establish liaison with intelligence agencies of other arms and services in the area, and coordinate other types of intelligence materiel discovered with such agencies (i.e., Chemical Corps., Ordnance, Signal Corps., etc.).

Air Technical Intelligence Team

a. Organized and equipped as a completely self-contained mobile unit capable of extended field operation.

b. Investigate and prepare complete intelligence reports of foreign air materiel at the site of crash or capture.

c. Designate and arrange for movement, and for

1291

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

the guarding of foreign air materiel of new design or of intelligence value.

d. Secure all documents, manuals, photographs and other data on foreign air materiel and forward to Air Technical Intelligence (ATI) field unit.

HANDLING ENEMY AIR MATERIEL

It is essential that captured, shot down or abandoned enemy air materiel be properly segregated and safeguarded by all concerned to permit full intelligence examination and analysis. Technological progress and development in the field of aviation is normally rapid and new designs and improvements often come in swift succession. The vital importance of military aviation in modern war causes belligerent nations to bend every effort to speed up creation of new designs and make every facility available to designers and inventors engaged in aeronautical research and development. Immediate and thorough examination of enemy air materiel, especially aircraft and projectiles, by technically qualified air intelligence personnel, is essential to the early development of counter-weapons and counter-tactics. New air weapons are often tested in battle before full production is developed. Intelligence examination of captured or shot down models may permit our development of countermeasures before the enemy employs the new equipment in quantity. It is mandatory that all military personnel are instructed as to proper procedure for the handling of captured or abandoned enemy air materiel for intelligence purposes.

REPORTING AND SAFEGUARDING ENEMY AIR MATERIEL

The individual and/or air, ground, or naval unit locating enemy air materiel is responsible for reporting the find to the Air Technical Intelligence Section or field unit of the area concerned, and, consistent with battle conditions and the local situation, with safeguarding the materiel until released by authority of A-2.

AIR CRASH REPORTS

Crashed or forced down aircraft, rockets, or other self-propelled air missiles will be reported by telephone, or where impracticable, telegraph or radio. "Enemy Crash Report" will be made direct to the Air Technical Intelligence or Field Unit of the area, and a written confirmation copy forwarded thereto by the most expeditious means through normal intelligence channels. (See "Enemy Crash Report" form and sample report.)

ATIS HEADQUARTERS—AF

All other captured or abandoned air materiel, including aircraft; air supplies and depots; documents; rockets, guided missiles, and rocket launchers; radio, radar and other communication devices will be reported. This report, giving description, location, and disposition will be accomplished by the unit originally locating the materiel. It will be addressed and forwarded to the Air Technical Intelligence Section or field unit responsible for the area, by the most expeditious means through normal intelligence channels. Telephone, telegraph or radio reports may also be made when deemed advisable.

COLLECTION AND FORWARDING OF ENEMY AIR MATERIEL

Except as necessary to remove injured personnel or put out fire, enemy "crashes" will be carefully guarded and not touched except as directed by ATI personnel. Local unit commanders will render such assistance as is requested by the ATI commander for guarding, handling and shipment of air materiel, unless it seriously jeopardizes their combat mission.

Except in the case of air "crashes," all air documents and air materiel captured or found in combat

1292

THIS PAGE IS UNCLASSIFIED

areas will, if practicable, be moved through normal collection channels designated by the A-2 of the nearest Air Force unit, according to theater directives. Guarding of captured aircraft, supplies, air dumps, etc., and other materiel will be taken over from combat troops by air force military police under the direction of the responsible ATI officer, as soon as practicable.

The MP Commander will be notified as soon as the Intelligence examination has been completed and materiel will then be released to normal salvage.

DISPOSITION OF CAPTURED AIR MATERIEL

Air Materiel found after examination to have no further intelligence value will be released to salvage agencies by properly authorized ATI personnel in the field.

Air Materiel, which in the opinion of ATI Field personnel should be subjected to further technical examination, will be crated as necessary and transported to the Air Technical Intelligence Division or other designated place.

Air materiel requested by Air Materiel Command or other proper agency, or which in the opinion of the Chief, Air Technical Intelligence Section, should be forwarded to AMC for detailed analysis, will be properly crated, tagged, and shipped. Air shipment may be authorized by A-2 in special cases.

ATI personnel are responsible for notifying the technical intelligence agencies of other arms and services, of materiel which is a responsibility of those services, or in which there is reason to believe that they have an interest. Other technical intelligence personnel are likewise required to notify ATI concerning materiel of air interest.

ATI Clearance of Souvenirs and Trophies

After examination by properly authorized ATI personnel and found to have no further intelligence value, items of enemy air materiel, as are authorized in theater directives, may be cleared and given to troops as souvenirs. Authorized ATI personnel will be provided with proper rubber stamps marked "examined and cleared by ATIS,–Air Force." The souvenir or a document clearly identifying same will be stamped for clearance, dated and signed with the name and rank of the authorized ATI officer. When so authorized in theater directives ATI personnel are encouraged to utilize this convenient means of rewarding individuals for reporting, guarding and assisting in the crating and movement of captured materiel.

Name plates will never be cleared as souvenirs, but many other articles such as aircraft instruments; "Directions" and similar plates; gun sights; binoculars; pistons; flare pistols; compasses; etc., are eagerly sought after as trophies of war. Immediate and rigorous disciplinary action will be taken by all commanders against persons, not having an ATI souvenir clearance, found in the unauthorized possession of enemy air materiel.

In order to prevent duplicate reporting and re-examination of crashed aircraft, the ATI Section and the Operations officer of the field units will maintain an up-to-date "crash situation map" showing the location and condition (or removal) of all enemy crashes; and of all friendly crashes located off of recognized airfields. All crashes, friendly or enemy, away from the immediate vicinity of airfields, which are recognizable visually as such from the air or ground, and which cannot be removed or destroyed, will be clearly marked before being abandoned. Each individual wing, fuselage and tail, identifiable as such from the air, will be clearly marked in yellow or white paint with the letter X extending ⅔ the wing chord and width of fuselage. For ground observers the notice "Examined by ATIS–AF and abandoned. _____" will be
(Sig.)
prominently stenciled on each major section. ATI is responsible for marking enemy air materiel. The air unit handling or responsible for the friendly crash is responsible for marking same and for notification to the ATI Section or nearest field unit. The ATI Section will be notified of the exact location (and removal or abandonment) of all friendly as well as enemy crashes, by reporting units.

PROCESSING CAPTURED AIR MATERIEL AND REPORTS

Information obtained in the initial field examination by ATI Teams of air materiel is forwarded immediately to the ATI Field Unit for analysis and consolidation with other reports from other ATI teams, and is then forwarded to ATI section for final evaluation, analysis and necessary dissemination. Speed is essential in locating and getting the ATI Team to the scene of the crash. Likewise speed and accuracy are essential in their reporting the full results of their subsequent examination of the enemy materiel to the ATI Field units. Selected items of equipment are brought to the ATI Section for further analysis and specially qualified technicians in the section or in other ATI Teams may be sent to the crash.

1294

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

In some theaters the ATI Section may have allied civilian or military laboratories or depots available for further detailed analysis and tests of important enemy materiel. A joint or combined Air Technical Intelligence Center (ATIC) may be organized to centralize and facilitate laboratory and other examination and the exchange of air technical intelligence information between various allied services.

DISSEMINATION OF AIR TECHNICAL INTELLIGENCE

ATI Summaries are issued at regular periods by each ATI Section and or at ATI Center for the dissemination of technical intelligence originating within the area. Special ATI reports or bulletins are issued as necessary to insure prompt release of special information. More comprehensive ATI summaries are published by the Air Materiel Command based on the reports from all field agencies, often supplemented by detailed laboratory and engineering examination and tests by AMC.

Combat interrogation of a fighter pilot may reveal that he encountered a new type enemy aircraft. His description of the aircraft, estimate of its speed, etc., will be checked against information from other sources and published immediately in an ATI Summary or Report. Combat interrogation of other pilots subsequently encountering the aircraft will furnish additional information or disprove the first report. Enemy crashes of the new model and prisoner of war interrogation will give further data. Finally an undamaged aircraft may be captured or an aircraft built up from the parts of numerous crashes. Flight tests of this aircraft will furnish accurate characteristics, performance, and operational data. The time elapsed between the first air encounter with the enemy aircraft and our flight test of an actual example may, however, take many months, even years. Technical information from all the various intelligence sources will, however, usually provide sufficient information that accurate performance estimates can be made by qualified technical specialists soon after the first discovery of the aircraft. Combat personnel are informed immediately, through ATI Summaries and Bulletins, of each new important technical intelligence of operational importance.

COMBAT REPORTS AND AIR CREW INTERROGATION

Technical intelligence is gained not only through physical examination of enemy air materiel but from any other sources, one of the most important of which is interrogation of combat air crews. First reports of a new weapon, new adoption, new tactic, or new employment usually come from interrogation of air crews returned from combat missions. Accurate reports of their encounters with the enemy, and detailed descriptions of some new or unusual occurrence, especially with pertinent on-the-spot notes, are invaluable contributions, to the defeat of the enemy. The factual report of a watchful, alert, pilot or crew will sometimes be an important key in the discovery of an enemy military secret. Our rapid development of counter-tactics and counter-measures in combat air operations depend on accurate reporting of combat experiences by air personnel.

Attention to detail, recognition of the unusual, and a genial ability to extract detailed information from the tired air crew at each routine interrogation are invaluable assets to the interrogator in producing intelligence.

ATI personnel participate in air crew interrogation only in special cases but depend on unit interrogation reports as one of their sources of technical intelligence.

Questions and Leads for Classroom Discussion

1. What is the purpose of Air Technical Intelligence?
2. What Air Force Agency is responsible for ATI?
3. On what basis is ATI organized?
4. What is the composition of a joint ATI section? A combined ATI section?
5. What does an ATI team usually consist of?
6. Discuss briefly the functions of the:
   a. Technical Intelligence Division, AMC.
   b. ATI Section, command or air force.
   c. ATI field unit.
   d. ATI team.
7. What is involved in handling enemy air materiel?
8. How is enemy air materiel collected, forwarded and disposed of?
9. What are sources of ATI other than enemy air materiel?

CHAPTER XVI

FLAK INTELLIGENCE AND ANALYSIS

The processes of Flak Intelligence and Flak Analysis were conceived and developed during the years of World War II. By the spring of 1943 the decline of the *Luftwaffe* had speeded the development of enemy anti-aircraft defenses to an unprecedented degree. Flak had become so effective that it more than kept pace with our growing air effort.

As a countermeasure to this menace, the AAF established a flak intelligence and flak analysis program intended to reduce the high operational losses directly attributed to flak.

The name flak was derived from the German, "Flieger Abwehr Kanone" or "cannon against aircraft." This term was applied to all enemy anti-aircraft and has remained in use. However, since the end of World War II, new weapons and aircraft have introduced many new air defense problems which have increased the scope of the term.

These new problems have been reflected by various phases of the mission assigned to the Defensive Air Branch, Directorate of Intelligence, USAF. This mission includes:

a. Produce air intelligence on the defensive capabilities of alien air forces and on the defensive capabilities of all counter-air weapons of foreign nations against offensive air operations and coordinate with the Intelligence Department, Air Materiel Command.

b. Analyze the capabilities of surface-to-surface, air-to-surface, and air-to-air guided missiles and their technical features now developed or contemplated by all alien countries.

c. Analyze electronics as applied to detection, identification, guidance, control, and communications, existing or contemplated in all alien countries.

d. Analyze foreign nuclear physics activities as applied to guided missiles and airborne equipment; and foreign biological activity as applied to guided missiles and airborne equipment.

e. Analyze the capabilities, characteristics, and

1296

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

performance of all conventional and non-conventional foreign aircraft and aircraft engines and their existing or contemplated technical features.

f. Process all information on foreign land-based and shipborne anti-aircraft artillery, and surface-to-air missiles, including technical information on performance characteristics of weapons and fire control instruments, current tactical doctrine, techniques of employment, and order of battle.

g. Collaborate in developing new and improved methods of analyzing all types of enemy land-based and shipborne anti-aircraft defenses and in preparing flak computers and other special equipment for facilitating and improving current methods of flak analysis. This includes liaison and collaboration with the Flak Analysis Section of the AA School.

FLAK INTELLIGENCE

Flak Intelligence, as one of the sources of intelligence information, is that part of air intelligence concerned with the collection, processing and dissemination of information on enemy ground-based air defenses and with avoiding or counting such defenses during operations in order to reduce their effectiveness. The term, Flak Intelligence, embraces a consideration of active and passive means of ground-based air defenses. It does not include airborne defense weapons such as fighter aircraft and air-launched missiles.

Flak intelligence provides flak officers with basic data required to analyze flak defenses. Based on this analysis, the flak officer reports information necessary for the planning phase of air missions of many different types including airborne and para-troop attacks. These reports give specific information including the location and probable intensity of route flak and the necessary evasive tactics required to minimize effects of that fire. They also include an analysis of all enemy anti-aircraft defenses in the vicinity of the proposed target as an aid to determining data for the mission on the initial point, altitude of attack, favorable and unfavorable axis of attack, evasive action procedures prior to bomb runs, and action after bombing.

Flak intelligence also provides data needed by both air and ground units who employ countermeasures against the flak defenses. For example, it contributes much valuable data to the general intelligence task of locating enemy ground concentrations because these units are often employed in quantity to protect troop and supply establishments. Also, it provides valuable data for use in the development of our air force formations and air maneuvers which minimize the capabilities of enemy anti-aircraft equipment.

Flak intelligence is produced from information which is obtained from three main sources.

The first of these, photo interpretation, is by far the most prolific, accurate, and dependable source. It must be emphasized that photo interpretation for flak must be accomplished with accuracy, dispatch, and from a central interpreting center. Central interpretation makes possible the elimination of duplication which has been the cause of many inaccuracies in flak data in the past.

The second major source of flak intelligence is the multitude of operations reports and interrogations which every air unit initiates immediately after a mission is completed. During World War II, this chain of intelligence produced much useful data on enemy defenses not obtainable from photo sources.

The third source of flak intelligence comprises miscellaneous sources, such as prisoner of war interrogation, captured documents, examination and test of captured material, and electronic countermeasure reconnaissance.

FLAK ANALYSIS

Flak analysis is that part of flak intelligence which evaluates the relative chance for damage and loss of combat aircraft or missiles when any one or more of a group of variables which effect the efficiency of the defense is altered The chief variables are:

a. Vulnerability and spacing of aircraft.
b. Capabilities of defending weapons.
c. Speed and altitude of approach.
d. Speed and direction of wind.
e. Number and disposition of defending weapons.
f. Aircraft heading.

The planning of air operations against an enemy must include provision for the defense of the participating aircraft against both enemy air opposition and enemy anti-aircraft defenses. In some cases, these two provisions conflict. For example, compact bombing formations usually offer the best defense against enemy fighters, but at the same time such a formation offers a better target to enemy anti-aircraft gunners. It follows then that types of defense measures employed are contingent on the character of the enemy opposition.

The first logical step to reduce flak loss and damage is to avoid exposure to anti-aircraft fire or guided missiles whenever possible. Specifically, com-

1297

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

bat crews are briefed on the location of enemy flak batteries and navigators avoid these positions by accurate route navigation. Good flak analysis assists proper route selection, evasive action, and countermeasures. The strategic flak map is of great assistance in selecting the best route because it shows the overall picture of AA defenses over enemy-held territory to the target. Routes can be selected with a view not only of avoiding flak areas but also with due regard to weather, time of attack, and range capabilities of the aircraft. Prudent and accurate routing of combat missions is an important part of any air operation.

The best method of lowering the efficiency of enemy defenses at a target is to discover and exploit the weak spots. Flak analysis discovers these weak spots and provides information for exploiting them and determining gun-defense effectiveness. This is defined as the total expected number of hits from a battery or batteries on the ground and it is calculated by summing up all the hit expectancies for all the bursts delivered on a target. Flak computers are used which take into account all of the theoretical factors which combine to indicate the true effectiveness of a gun-defended area. Computers are individually constructed to a set of given data, dependent on composition of the defense and the type of defense employed. When an AA battery attempts to place a burst at a certain point in space, a number of factors cause scattering of the bursts. This scatter effect is called dispersion, and the cluster of bursts in the sky is called dispersion volume. At short ranges for mechanically fuzed ammunition the transverse errors are smaller than the range errors, thus the dispersion volume appears egg-shaped, with the long axis along the trajectory. At long ranges, the reverse is true and the dispersion volume looks like a door knob. The dispersion volumes at the longer ranges can contain an entire formation of 18 bombardment aircraft in combat box stagger, and all planes in the formation contribute to the hit expectancy of any burst.

The results of this analysis of the target area may be presented in several forms. One is the Flak Clock, which shows the best "in" and "out" courses in green with low priority figures in red with high numbers. This clock is the final result of a target flak analysis and forms part of the recommendation of the attack axis or sector which the flak officer makes in the mission planning conference. Depending on all factors, such as navigator requirements, sun, and weather, the final axis of attack on the target is actually selected by compromise.

The important point to remember is that flak MUST be considered on all air missions. Flak is like fire: Neither can be disregarded; both must be respected. Fire makes both fire prevention and a fire department necessary. Flak opposition demands both flak intelligence and flak analysis. In addition, flak analysis techniques must be studied and modified to insure effectiveness against future ground-to-air defenses (e.g., rockets and guided missiles) as well as against present anti-aircraft artillery.

GLOSSARY OF FLAK TERMS

ALTITUDE.—The vertical distance to a point in space from a horizontal reference plane, usually the horizontal plane containing the battery.

ANTI-AIRCRAFT.—Any artillery used against aircraft. In the broad sense this term includes searchlights, balloons, warning nets and all ground installations used in the engagement of hostile aircraft.

AUTOMATIC WEAPON.—See "Medium Flak."

BARRAGE FIRE.—Anti-aircraft fire having for its purpose the placing of a curtain or barrier, executed on predetermined firing data, across the probable course of enemy aircraft.

BARRAGE JAMMING. — The simultaneous jamming of a number of adjacent channels or frequencies.

CHAFF.—Electromagnetic wave reflectors in the form of narrow metallic strips used for creating radar echoes for confusion purposes. See also *Window* and *Rope*.

CHANCE OF DAMAGE.—The summation of the chances of being hit by anti-aircraft fire when passing along a crossing course within range of gun batteries. This equals the "effectiveness."

COMBAT MANEUVERS.—See "Evasive Action."

COMPUTER, FLAK.—A series of curves of fire effectiveness drawn to scale, used in the determination of the effectiveness of anti-aircraft guns, automatic weapons, and in the near future surface-to-air missiles against aerial targets flying along various courses.

CONTINUOUSLY POINTED FIRE.—A system of fire control which results in the placing of a line of anti-aircraft artillery burst along and continuing with the target aircraft. If the fire is inaccurate and the gun density high, however, the impression may be gained that barrage fire is being employed.

CROSSING COURSE.—The horizontal course of an airplane which is within range of an anti-aircraft gun battery, but which does not pass vertically over the battery.

CROSSING COURSE FOR MAXIMUM EFFECTIVENESS.—A crossing course tangent to the dead zone of the battery. Along this course the chances of damage are greater than along any other straight line course at that altitude.

DAMAGE, CHANCE OF.—A term sometimes used to denote effectiveness of anti-aircraft fire or surface-to-air missiles.

DEAD ZONE.—The area directly above a gun position in which the gun cannot fire because the quadrant elevation cannot exceed a definite value (70° to 85°).

DIRECTOR.—A predictor, or fire control instrument which, electrically or mechanically, continually calculates the firing data pertaining to the future position of the target.

DUAL PURPOSE GUN.—A gun so designed and constructed that effective fire may be delivered against either aerial or surface targets.

EFFECTIVE CEILING AA.—The maximum vertical range for a directly approaching aircraft at 300 miles per hour which can be engaged for 20 seconds with the last round fired at a quadrant elevation of 70°.

EFFECTIVE GUN CIRCLE.—The horizontal cross-section of the limiting envelope at a constant altitude. The radius of the effective gun circle is the maximum horizontal range of the gun at that altitude.

EFFECTIVENESS.—The summation of the hit expectancies of all rounds or missiles fired at a given aerial target.

ELECTRONIC COUNTERMEASURES.—That major subdivision of the military use of electronics involving actions taken to reduce the military effectiveness of enemy equipment and/or tactics employing or affected by electromagnetic radiations.

ELECTRONIC DECEPTION.—The radiation or reradiation of electromagnetic waves in a manner intended to mislead the enemy in the interpretation of data received by his electronic equipment. This does not include manipulative and/or imitative communication traffic.

ELECTRONIC JAMMING.—The deliberate radiation or reradiation of electromagnetic waves with the object of impairing their use by the enemy.

ELECTRONIC SEARCH OR RECONNAISSANCE.—Search for electromagnetic radiations to determine existence, source, and pertinent characteristics.

EVASIVE ACTION.—Maneuvers of a single airplane or formation (turns, changes of altitude and speed) designed to decrease the accuracy of opposition. At high altitudes, or for airplanes in formation, evasive action is normally gentle, or gradual. For airplanes encountering fire at short ranges, evasive action is normally violent, involving rapid changes of course, altitude and speed.

FIRE CONTROL.—All operations connected with the preparation and actual application of effective fire upon a target. Instruments, such as aiming circles, range finders, telescopes, director, radar, etc., which determine the directing and sighting of the guns or missiles, are known as "fire control instruments."

Fire, Intensity and Accuracy of.

a. Heavy Flak

1. Accuracy

Accurate: Burst in close proximity so that airplane is either hit or rocked. Inaccurate: Burst beyond danger area and no hits obtained.

2. Intensity

Meager: Less than 2 burst per second. Moderate: From 2 to 5 burst per second. Intense: Over 5 burst per second.

b. Medium and Light Flak

1. Accuracy

Accurate: Tracer streams in close proximity to plane and/or hits obtained. Inaccurate: Tracer streams well away from planes and no hits obtained.

2. Intensity

Meager: Less than 4 weapons in action. Moderate: 4 to 12 weapons in action. Intense: Over 12 weapons in action.

(Note: No standards for accuracy or intensity of surface-to-air missiles have as yet been established due to present state in the development of the weapon.)

FIRING TABLE.—A table or chart giving the data needed for firing a gun accurately on a target under standard conditions, and also the corrections that must be made for special conditions, such as winds or variations in temperature or muzzle velocity. A set of firing tables is made for each weapon.

1300

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

FLAK NEUTRALIZATION.—The reduction of the volume or accuracy of anti-aircraft fire or surface-to-air missiles by application of active countermeasures to these installations. The process may include actual destruction of personnel and materiel or temporary interference with the delivery of actual fire.

FLAK.—Foreign anti-aircraft artillery and surface-to-air missiles. The term originated from the German *Flieger Abwehr Kanone*, or cannon for use against aircraft in World War II. The fire of such weapons.

FLAK ANALYSIS.—That part of flak intelligence which deals with the determination of the effectiveness of anti-aircraft fire and surface-to-air missiles, including the capabilities of specific defenses.

FLAK CLOCK.—A graphic presentation of the expected effectiveness of a flak defense for various headings of attack.

FLAK INTELLIGENCE.—That part of air intelligence which deals with enemy anti-aircraft artillery and surface-to-air missiles.

FLAK MAP.—A map of flak-defended area on which are plotted the positions and numbers of surface-to-air launchers; light, medium and heavy anti-aircraft guns; searchlights; radar and other appropriate defense installations.

GROUND SPEED.—The speed of the airplane relative to the ground. The ground speed is the vector sum of the air-speed and the speed of the wind. Ground speed is designated as Vg.

HEAVY FLAK.—Large caliber foreign anti-aircraft guns, 75mm and larger. The fire of such weapons.

HORIZONTAL RANGE (AA). — The length of the base of the vertical right triangle in space, the vertical side of which is the altitude and hypothenuse of which is the line of sight between gun or director and airplane.

INITIAL POINT, IP.—A landmark used for navigation purposes over which the turn is made toward the target prior to bombing run by piloted aircraft.

LIGHT FLAK.—Small caliber foreign anti-aircraft machine guns, less than 20mm in caliber. The fire of such weapons.

LIMITING ENVELOPE.—When points in space, which represent the maximum horizontal ranges for all altitudes, are connected by a continuous line, this curve is called the limiting envelope. The maximum range for any altitude is limited by the muzzle velocity and the maximum time of fuze burning. Mathematically, the limiting envelope is the focus of all points on trajectories for the time of flight for maximum fuze range.

MAXIMUM CEILING (AA).—The maximum vertical range of a projectile. This is limited in heavy anti-aircraft by the maximum fuze range.

MEDIUM FLAK.—Foreign anti-aircraft weapons from 20mm to 75mm in caliber. The fire of such weapons.

MID-POINT.—The point on a crossing course when the airplane is nearest to the target.

PREDICTED CONCENTRATION. — Anti-aircraft fire in which one or more sets of fixed firing data are used to aim fire at one or more future positions of the target.

PROBABILITY.—The chance of a single shot being a hit.

QUADRANT ELEVATION.—The vertical angle between the horizontal and the axis of the bore when the gun is ready to fire.

RADAR.

a. The principle of locating reflective targets or objects by the measurement of the reflected pulses of radio frequency energy.

b. A term applied to devices which make use of the radar principle. (The word was derived from a contraction of the phrase "Radio Detection and ranging.")

RADAR CONTROL.—General term applied to radar used for:

a. Control of fighters in interception missions.

b. Control of guided missiles.

c. Control of aircraft engaged in close co-operation missions.

d. Fire control.

RADAR, EARLY WARNING.—Long range search radar in which accuracy in the exact positioning of the target has been sacrified for range.

RADAR, GUN LAYING.—Gun-laying radar or fire control radar. Radar furnishing position data accurate enough for computation of gun firing data (by a director).

RADAR, SEARCHLIGHT CONTROL. — A radar furnishing position data sufficiently accurate for control of searchlights.

1301

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

RADCM–RADAR COUNTERMEASURES AND DECEPTION.–This includes all electronic countermeasures against radar.

RATE OF FIRE MAXIMUM–The greatest sustained rate of fire in rounds or missiles per minute of which a gun, weapon, or launcher is capable. This equals the cyclic rate in automatic weapons when the operation is fully automatic.

RATE OF FIRE PRACTICAL.–The rate of fire, in rounds or missiles per minute, capable of being attained by an average crew with a particular weapon.

ROCCM–CONTROLLED DEVICES COUNTERMEASURES.–This includes all electronic countermeasures against guided missiles, pilotless aircraft, proximity fuzes and similar devices.

ROPE (electronics).–Electromagnetic wave reflectors, consisting of long strips of metal foil. A small parachute or other device may be attached to each strip to reduce rate of fall. See *Window*.

SATURATION.–The presentation to a flak defense of more aerial targets per unit of time than can be engaged effectively by that defense.

SCOPE.–An oscilloscope or cathode ray tube indicator.

SEEN FIRE.–Anti-aircraft fire directed by fire control instruments in which the target is tracked visually. Present slant range or altitude may be determined by other visual means.

SLANT RANGE (AA).–The distance in yards from the gun to the predicted position of the target airplane. The slant range is the hypothenuse of the vertical right triangle in space, the vertical side of which is the altitude and the base of which is the horizontal range.

SMOKESCREEN.–Curtain of smoke used to mask either friendly or enemy installations or maneuvers.

SPOT JAMMING.–The jamming of a specific channel or frequency.

SURFACE-TO-AIR MISSILES. A guided ground-launched missile to counter any air attack by piloted or pilotless aircraft or missiles.

TIME OF FLIGHT.–The elapsed time from the instant of departure of the projectile to the instant of impact or the instant of burst. In a crossing course this varies from the time for maximum fuze range at the effective gun circle to seconds at midpoint.

UNSEEN FIRE.–Anti-aircraft fire directed by non-visual position-finding instruments at night or during periods of low visibility.

TOTAL EFFECTIVENESS.–The total chance of damage along a crossing course when the airplane is first fired upon at the effective gun circle for that altitude. The "contour" curves of the Curve VII are for the total effectiveness. In order to measure effectiveness a difference reading must be taken between two of these curves.

WINDOW.–The name for strips of frequency-cut tinfoil, metal, wire, or bars usually dropped from planes or expelled from shells or rockets as a radar countermeasure.

Questions and Leads for Classroom Discussion

1. The name "flak" was derived from "_____ _____ _____"?
2. What are four phases of the mission assigned to the Defensive Air Branch, Directorate of Intelligence, U. S. A. F.?
3. What is provided by flak intelligence?
4. What are three sources of flak intelligence?
5. What is flak analysis?
6. What is a "flak clock"?
7. How is the final axis of attack selected?

CHAPTER XVII

TARGET INTELLIGENCE

INTRODUCTION

"The mission of Air Power is to force the capitulation of an enemy nation through air attacks or threats of air attacks."

Without target intelligence the Air Force mission could not be accomplished. Ignorance of the various enemy target systems on the part of any air force results only in a fruitless expenditure of energy, a misuse of air power and a failure to reduce the enemy's ability to wage war. Witness the *Luftwaffe*.

In the early part of World War II our own inability to properly select targets effectively prevented us from deriving the utmost benefit from our bomber and fighter efforts. Many of the targets selected for attack did not materially affect or reduce the enemy's war potential. However, as the war progressed and our technique developed, more and more selective damage was inflicted on the enemy with telling results.

The demanding requirements of modern war have rapidly diminished the margin for error and forced the development of target intelligence into an exceedingly complicated affair. It is recognized that time, more than ever, will be the essence of success in the waging of war in the future, and the ability to deliver a vital crushing blow on the enemy without delay is a paramount necessity. This factor, plus the natural limitations imposed by the costly expenditures of bombing missions in terms of highly trained personnel, equipment, and energy make precise and correct selection of targets an absolute requirement. Each factor relating the target to the enemy's war-making ability must be carefully evaluated in order to establish correct priorities for destruction.

The present target system of the Air Forces is based on past experience and attempts to give world coverage. Information in many instances is incomplete and great effort will be necessary to obtain complete and up-to-date intelligence.

A state of global war presents innumerable tar-

1303

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

gets and the proportionate striking forces available at any one time are necessarily limited due to the factors previously mentioned.

Realization of this fact resulted in the development of the science of target evaluation and priority rating as it is practiced today. The procedures involve an exhaustive study of the potential enemy's entire industrial and economic system. These strategic studies determine the pressure points and bottlenecks in his war potential and indicate his sensitivity to their destruction.

Before proceeding on to the principles employed in the selection of strategic targets, it may well be noted that industrial dispersion, particularly over a large land mass, may considerably nullify the effects of indiscriminate atomic bombing. As such dispersion is an obvious and logical action on the part of a potential enemy, target intelligence assumes an added importance in the waging of atomic war. (Discussion of atomic warfare is not within the classification of this handbook.)

STRATEGIC TARGETS

Strategic targets are pre-selected objectives, vital to the industrial support of the enemy's war potential. Targets in this general category include oil and steel centers, hydro-electric plants, aircraft factories, armament and automotive plants, transportation hubs, etc.

In strategic target selection, industries are selected for attack in accordance with the following principles:

a. Upon the basis of their immediate importance to the war machine of the enemy.

b. Their relative importance to the entire industrial system.

c. Their vulnerability to attack.

The selection is, in fact, simply a process of elimination based on certain well designed criteria. Logically then, the purpose and plan of strategic bombing may be defined as, *"The progressive destruction of concentrated material and reserves."* It is generally agreed that the most menacing capabilities of the enemy are found in his reserve. At this point materiel is ordinarily more decisive than personnel. This reserve position when limited to materiel includes:

a. Strategic Targets

1. Productive capability.

2. Completed materiel under centralized control.

3. Means of distribution of materiel to support particular engagements.

b. Tactical Targets

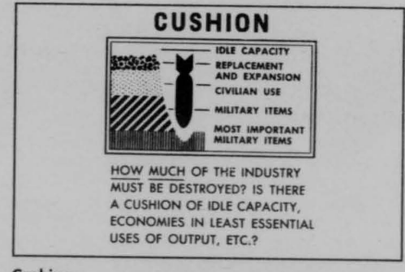
1. Materiel in immediate support of particular engagements.

The function of strategic bombing is to interfere with the enemy's ability to produce military supplies and thus affect his replacements at the front. The emphasis here is upon interference with production, in order to weaken the enemy's front line strength by making it impossible for him to replace the losses he suffers by attrition from our tactical attack.

In planning a program of strategic bombing, the whole economy of the enemy will be spread out before us as a possible bombing target. This economy is divided into target systems, each of which will have its own particular bottleneck or pressure point.

FACTORS WHICH DETERMINE TARGET SELECTION

The following criteria determine the selection of targets and the priority rating which each one should have:



Cushion

How much excess capacity exists within the industry? What percentage of the total production goes to non-essential use? What is the position of his stock-piled reserves?

It is said that any industry is protected in some measure by economic cushion, both internal and external, which may be drawn upon in emergency to overcome actual or threatened impairment of the output. Utilization of such economic cushions by one industry is almost always at the expense of other industries. Thus, the managers of the war economy must decide in each case whether the restoration

1304

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

or maintenance of output in a particular industry is of sufficient importance to warrant sacrifice of other production. The criterion that we call cushion is merely a consideration of the capacity that must be destroyed before it has been reduced to such a critical point that the enemy's military strength is seriously affected. The enemy can usually suffer some loss of capacity without critical consequence. The problem is to determine for every industry where this point occurs and how much of the capacity has to be knocked out before the critical point is reached. Consideration of the cushion of a potential target must always involve a detailed study of the consumption pattern of the product. This pattern will disclose the proportions of the output going respectively into:

a. Strategically important military end items.

b. Insignificant military end items.

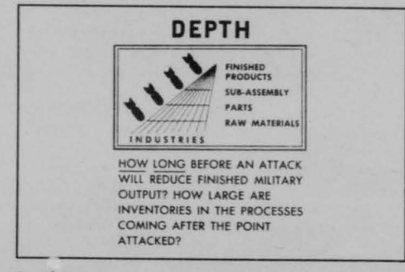
c. Capital equipment.

d. Civilian goods.

With this knowledge it will be possible to ascertain how specific the effect of attacking the industry will be and what economies the enemy will probably be able to effect by cutting down low priority uses. For example, the enemy might be in the position to reduce the proportions ordinarily devoted to the production of capital equipment and civilian goods. This proportion can often be reduced quite drastically, and the enemy's capacity for tightening his belt should not be underestimated.

Very often further reduction can be made in civilian consumption long after it is believed that the irreducible minimum has been reached. Part of the cushion, too, is the excess capacity which may exist in the industry. It may be possible for the enemy to increase production in plants which were idle. If idle capacity in the same industry is not available, the enemy may be able to convert facilities in other industry to produce the product. For example, the Japanese had so constructed their cement plants that they were able to convert them in three to six months into aluminum plants, thus adding considerable cushion to the aluminum industry. In Japan, 80% of all aluminum produced went to the aircraft industry. When our bomber forces attacked and wrecked the aircraft engine plants and airframe plants, the requirements for aluminum decreased with the result that that industry had an ever growing cushion in the stockpile of materials on reserve.

There is the further possibility that the enemy may use substitutes for the particular product turned out by the industry under consideration. In general, it might be said that the more diversified the use of the particular product, the greater choice the enemy has in determining where the loss of output is going to fall. It is essential in analyzing any industrial target to imagine what an enemy Board of Allocation would do in the event the output dropped 50%. In this way it is possible to envisage where the blow would fall in the event of serious loss of output, and the consequences of an attack on a particular target system can then be approximated.



Depth

Our second consideration is that of depth. In judging the value of attacking any target system, we are concerned with the depth of that target or the time lag. How quickly will loss in production be felt by the armed forces? How soon will the attack affect the enemy's military strength, particularly his front line strength? Tnis time lag is the thing that determines the depth of the target and consists of:

a. The time of manufacturing or processing cycle.

b. The time required to move the military end product up to the front line.

For our purposes, it is particularly important to consider the length of the so-called manufacturing cycle. If, for example, aluminum factories are attacked, the time between the destruction of the factory and the effect on front line aircraft strength will be much longer than if the air force attacked aircraft assembly plants which are, of course, turning out the final end item. In other words, the closer one comes to the raw material or semifabricated stage, the longer it takes for the destruction of output to affect the military front-line strength

1305

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

of the army. It is obvious, therefore, that depth is of extreme importance.

If, for example, an invasion of enemy territory within two months is contemplated and the strategic bombing program must be geared to that objective, it will not pay to go after targets like the steel industry, the destruction of which might not be felt for six or seven months. Only those targets should be selected which lie at or in the semi-fabricated or final fabrication steps, because their destruction will have a quick effect on the enemy's military strength.

The depth of the potential target system has other implications. The deeper the target, the greater possibility of cushion at the various stages of the whole productive process. This factor alone gives the enemy some opportunity to adjust himself to the loss of output by utilizing the reserves at various stages in the manufacturing cycle. The deeper the target, the greater the likelihood that part of the output may have a low priority and that economies can be made. Steel might be a case in point. It has many uses, so it is probable that at least some adjustment can be made by reducing the lower priority uses. Hence, there would be a sufficient cushion to guarantee material for the production of high priority military end products.

Reserves

What military reserves are immediately available to enemy operations and what is the rate of attrition?

Initial conclusions on available enemy reserves may be reached by consideration of a number of factors.

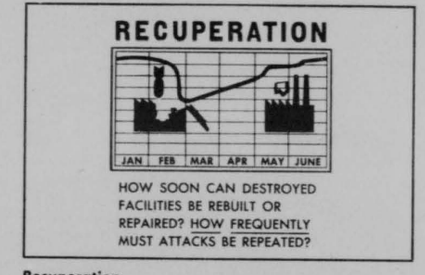
a. The enemy's attitude toward war as an instrument of policy and the amount of his peacetime economy diverted into his military establishment.

b. The probable length of time he was preparing for a state of active war.

c. His capacity for stock-piling certain expendable materials.

d. An evaluation of the enemy's estimate of his initial requirements for replacement based on definite time intervals.

Evaluation of available reserves, as a continuous project, will base its findings on an analysis of the enemy's gains by capture, losses by attrition, and his ability to replace and move his reserves to where they are needed.



Recuperation

How long will it take the damaged productive capacity to be repaired or otherwise replaced? For example, an aircraft assembly plant would have to have buildings of certain dimensions, and it would be safe to figure on the time necessary to build such a building. In some industries, special equipment and machinery would require a long time to replace whereas in other industries, machinery could be taken from plants manufacturing a low priority end product or equipment in low priority plants could be converted to the manufacture of high priority military end products. We must know for what period the plant and equipment can be knocked out and how quickly it can be replaced and repaired. The period of recuperation or repair has an obvious bearing on the frequency of attack which is required. If the damaged plant or equipment can be restored in three months, it means that the attacks must be repeated three or four times a year. However, if parts of another industry can be put out for nine months at a time, one would obviously choose targets in that industry over those in an industry that can be restored in three months, all other things being equal.

1306

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

The recuperative period is determined by several factors. The buildings in which the operations take place are usually specialized for some manufacturing processes and not at all specialized for others. In some industries production can be carried out in almost any building, the salvaged equipment easily transferred and operations resumed very quickly. If, on the other hand, production requires a specialized building as we mentioned in aircraft assembly plants, it might not be too easy for the enemy to find another building in which to carry on the manufacturing operations. The second factor affecting recuperation is the extent to which the equipment within the building is specialized and custom made. Certain kinds of equipment are fairly standard and can be bought in the market. If general purpose tools are damaged, for example, they may be replaced rather quickly from the manufacturer's stock or borrowed from lower priority plants. On the other hand, if the machinery is special purpose and built to order, the period of recovery or replacement would be longer, thus decreasing the frequency with which the same facilities have to be attacked.

Another factor bearing on recuperation is the time required for the resumption of output once the equipment and plant have been replaced. Some products require only a day or two to manufacture; others require several months; and still others, such as large turbines, for example, would require eleven or twelve months. Thus, if a turbine plant were destroyed, the enemy would get no output both during the time required to replace the plant and equipment and also during the eleven months required to manufacture the finished product. This estimate of eleven months is based on two assumptions:

a. That the plant is virtually self-sufficient and that it produces all the components and parts for turbines.

b. That all the materiel in process would be rendered unfit or completely destroyed.

These two assumptions might not be correct in the majority of cases. It should be stressed, however, that the length of the manufacturing cycle must be taken into consideration in calculating the period of recuperation, the period required before the finished output is restored and ready for use.

VULNERABILITY

HOW SUSCEPTIBLE TO DESTRUCTION ARE THE BUILDINGS, EQUIPMENT, AND PROCESSES OF THE INDUSTRY?

Vulnerability

How susceptible are the units within the target system to destruction by bombardment? In assessing the susceptibility of any target system to attack, we must consider the nature of the manufacturing or productive process. It must be ascertained, for instance, whether combustive or explosive materials are utilized. It is important to consider the degree to which the production process is integrated. One can roughly divide industrial processes into two classes:

a. A continuous process.—Most of the industries using this type of production are found in the chemical field, such as the manufacturers of synthetic ammonia or synthetic oils. This process involves the continuous flow and transformation of new material through successive stages into the final product. If the process is interrupted at any particular stage, operations in the entire plant come to a halt.

b. The other type of process is found in the metal working or mechanical industries and does not have the same degree of continuity in operation. There are usually many more units of equipment utilized at each particular stage, so that it is less easy to interrupt the process permanently and bring the operation in the entire plant to a halt.

Susceptibility to damage is also determined by the nature of the manufacturing equipment. Is it of heavy construction and hard to damage? Is it custom built and difficult to replace? Is the machinery of a common type which could be borrowed from a lower priority industry? We need to know whether the equipment is delicate, whether it does high precision work and if it is susceptible to damage by ground shock sustained through near-miss bomb hits. Another factor about which we should have information is the nature of the buildings utilized in the industry and, particularly, of the existence of structural characteristics common to the entire industry. We know the engineering industry which

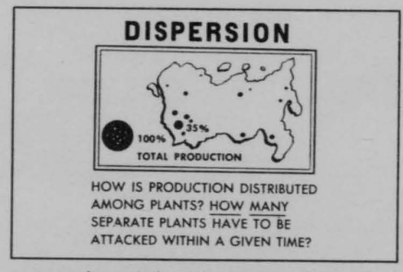
1307

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED



turns out heavy industrial products and is engaged in forging, casting, etc., would have one type of building, probably of heavy, solid construction. On the other hand, those plants engaged in light manufacturing processes would be housed in a lighter type of building more susceptible to damage. Under this criterion we are concerned about that portion of the industry which is operating underground, and if so, how far under.

Dispersion

On the basis of this criterion, several very profitable target systems offered themselves to our B-29's. For example, four plants were producing 80% of all Japanese electronic equipment, and three of these plants were located in Tokyo. This lack of dispersion not only simplified the problem of selecting our strategic targets but added greatly to the ease with which they could be attacked.

The aircraft industry posed another problem in that over a thousand plants, producing component parts, were scattered throughout the large cities of Japan with the production pattern going deep into the residential areas. Every neighborhood was organized to utilize the productive capacities of the home including the labor of children. Thousands of hand operated presses, as well as automatic presses, were stamping out parts for these component industries that were supporting the aircraft and electronic industries. The dispersion, then, of Japanese industry into the home areas not only invited but made necessary the pattern fire bombing which they received.

Dispersion is a factor that has an important bearing on the overall vulnerability of any target system. This criterion will aid in determining the ability of a limited air force to achieve that essential reduction in capacity which substantially affects the frontline military strength. We consider not only the number of plants within a target system and how close they are together, but also the extent and area of each individual plant. For example, steel plants usually cover an enormous area. The buildings in the plant are widely spaced and there is a lot of empty space on which the bombs could fall harmlessly. The proportion of vital equipment within any plant to the total floor space will indicate the number of bombs which must be dropped on the plant.

In the last analysis we want to know how many sorties per year are necessary to achieve and maintain the desired curtailment of output; and the number of sorties that are necessary to determine the overall vulnerability of the target system or the individual target within a system.

Location

What percentage of the particular target system is within effective bombing range and will the requirements for the desired degree of destruction be within the capabilities of our Air Force? These capabilities are subject to the factors of range and numbers and types of aircraft available. In the Pacific the choice of strategic targets initially was limited by the element of range alone. However, as soon as forward bases brought the whole economy of Japan within range of our attack, targets were selected on the basis of the other criteria we have just discussed.

TACTICAL TARGETS

Tactical targets are divided into three classifications:

a. High priority targets: Neutralization of enemy air effort, fighters and bombers in order to attain air superiority.

1308

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

b. Neutralization of airfields, supply dumps, enemy troop concentrations, etc.

c. Direct support of ground forces and continuing interdiction of the battle area.

Of these three classifications, the first is SOP. Obtaining air superiority is the highest priority target and must be accomplished before anything else can be done. Regarding second and third classification targets, it is SOP to have daily reconnaissance missions over the entire area, both photographic and visual, weather permitting. Missions conducted against second classification targets are for the purpose of isolating the battlefield, preventing the enemy from bringing supplies and troops, and preventing the enemy from using any airfield located near the battlefield itself.

Targets attacked in support of ground forces are normally targets selected by the ground force commander in the area. The commander is normally advised by an air liaison officer who forwards the request through air channels and frequently directs the strike from an observation post. Usual targets are strong points, armor, gun batteries, enemy troop concentrations, etc.

Questions and Leads for Classroom Discussion

1. How does Target Intelligence affect the mission of air power?
2. Define strategic targets.
3. What are the three principles governing the selection of strategic targets?
4. Where are the most menacing capabilities of the enemy found?
5. How many factors determine target selection?
6. Discuss briefly each of these factors.
7. What are the classifications of tactical targets?

CHAPTER XVIII
OBJECTIVE FOLDERS AND TARGET CHARTS

OBJECTIVE FOLDERS

One of the primary tasks recently completed by Headquarters, USAF was the standardization of Air Objective Folder material. These folders apply to both tactical and strategic operations and will be used by all air force units in planning, briefing, the conduct of training and the execution of all types of air operations.

The success of air attack is directly related to and dependent upon the adequacy and usability of target material available for planning and operational usage. Since Air Objective Folders will now be uniform throughout the services, constant usage will result in familiarization with this material. Interchangeability, both of air force personnel and Air Objective Folder material can be achieved within air force units operating on a global basis. The standards specified in this discussion shall not necessarily be regarded as permanent but may be revised by Headquarters, USAF (Directorate of Intelligence) to include changes as they become desirable.

In order to achieve standardization, two methods of assembling Air Objective Folder material were contemplated and included in the new regulation, AF 200-25, "Standardization of AOF Material," 15 December 48.

These folders are a compilation of intelligence on important targets in a given area and are the result of detailed analysis of enemy territory. They are one of the most important devices employed in the dissemination of intelligence and contain the following information:

a. **BY AREA.** Each area shall correspond to that covered by a 1:1,000,000 World Aeronautical Chart shall be grouped in one or more loose-leaf binders. For example, all target material relating to targets within the area of 1:1,000,000 World Aeronautical Chart No. 0165 would be grouped in one or more looseleaf binders shall be known as *"Air Objective Folders by Area."* The material relevant to specific targets shall be arranged consecutively by the target

1310

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

number assigned to each target by Headquarters, USAF (Directorate of Intelligence).

Contents for Air Objective Folders by Area should include:

1. General Notes.
2. Target listing by target number.
3. Target Listing by category.
4. Navigation and Pilotage Chart Section.
5. Urban Chart Area.
6. Individual Installation Target Data Section.
7. Urban Area Target Data Section.

b. BY CATEGORY. All target material relating to a specific target category within land masses specified by Headquarters, USAF (Directorate of Intelligence) shall be grouped in one or more looseleaf binders. Individually and collectively, these binders shall be known as "Air Objective Folders by Category." For example, all target material on all aircraft plants within the United States would be grouped in one or more looseleaf binders. The material relevant to specific targets shall be arranged consecutively by the target number assigned to each target by Headquarters, USAF (Directorate of Intelligence).

Contents for Air Objective Folders by Category should include:

1. General Notes.
2. Strategic Vulnerability Category Study.
3. Photo-Industrial Study of the Category.
4. Outline Charts.
5. Indices for each sub-category.
6. Target Data Section.
7. Urban Area Target Data Section.

Objective folders are usually, but not always, compiled in Air Force headquarters having a wide range of collecting agencies; but lower echelons are expected to forward all strategic information for inclusion in subsequent objective folders.

The objective folder or any part thereof will not be taken into the air on combat missions. For operational purposes, copies of air photographs of the objective and target maps and charts will be carried into the air. It is the responsibility of intelligence to prepare navigators' and bombardiers' kits containing such material.

TARGET CHARTS

A target chart is a chart or map by which the navigator and bombardier orient themselves in the general target area and identify the specific target on which the bombs are to be dropped. Perspective charts, drawn in oblique and foreshortened, show approaches from all angles so that bombardiers and radar operators will have a map portraying the terrain from the same angle of approach and in approximately the same perspective as seen from the air.

One of the major problems of all operations is locating the target. This problem evolves itself into two separate phases.

a. Finding the target area itself.

b. Locating the specific objectives within the target area.

In this connection, target charts are used in three different ways.

a. To aid in planning the mission, determining the IP, Aiming Point and Rally Point.

b. To aid in briefing the mission. Blowups of target and target areas will be used to graphically illustrate landmarks, approaches, etc., to the crews.

c. To be taken into the air by combat crews. For best uses, target charts should contain the following:

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

1. A chart of the target area. The scale should be small enough to include an area of at least 20 miles in radius so that the IP, Rally Point, etc., can be located on it. This chart is called the approach side.

2. A large scale map of the target itself. The scale should be such as to allow ready identification of the objective. This map is called the recognition side.

3. A compass rose should appear on each map as well as latitude and longitude subdivisions.

4. Elevation of the target and of other points around the target should be indicated. This is to assist the bombardier in rapid orientation and calculation of the bombing problem. It also orients the crew members as to their relative position.

5. Charts should be of such size as to allow easy handling in an airplane.

6. Coloring should be used to distinguish between topographic forms and should be printed in fluorescent colors making maps legible under night conditions. A black and white sketch is not enough.

7. All prominent landmarks that can be seen from the air should be shown on the chart. All other details should be eliminated from the charts as this creates confusion. Major landmarks that should be included on a target chart are bodies of water, railroads, highways, built-up areas, woods and other significant outstanding landmarks.

We might add, at this time, that in briefing for a mission, the following visual aids are generally used:

a. Route Map. (Includes I.P. and R.P.)

b. Approach Map. (Includes A.P.)

c. Target Map.

d. Blow-ups (balopticon projection or draftsman's drawings) of the target area and surrounding checkpoints.

e. Mosaics of the area.

f. Flak Map.

Target Strips

Target strips will normally contain a map of the general target area, usually covering a 25 mile radius. A sketch map of the immediate target area in larger scale is also included, showing installations buildings in detail, etc. These are usually numbered for rapid identification.

Also included are vertical photographs scaled 1:10,000 covering the immediate area of the target and also covering the very same area as that covered by the sketch map.

Target strips are usually provided by higher headquarters along with the Air Objective Folder and the target charts; however, in some cases the intelligence officer may have to improvise the best he can, should these not be available for certain specific targets. Although target charts, target strips and photographs are taken on combat missions, the *Air Objective Folder is never taken on combat missions.* Each crew will receive a target folder containing the necessary target charts and reconnaissance photos of the assigned primary, secondary and tertiary targets.

Photo Material

Photo material used in briefing of missions in conjunction with target charts are single photos, verticals and obliques, and photo maps—either mosaics or composites.

VERTICALS.—Vertical photographs are made from an aerial view point with the camera axis perpendicular to the earth. Features on the ground are registered on a vertical photo in perspective with little or no distortion in their relative shapes or sizes. The advantages of vertical photographs are:

a. Possess in pictorial effect a wealth of detail which no map can equal.

b. Possess accuracy of form.

c. With freedom of flight, an aerial photograph may be prepared in a short time.

d. May be reproduced in quantity.

e. May be made of an area otherwise inaccessible due to physical or military reasons.

OBLIQUES.—An oblique photograph is one made from an aerial viewpoint with the camera deflected from the perpendicular. They are classified as high or low obliques. High obliques contain the horizon while low obliques are without the horizon.

Obliques are used to very good advantage in briefing navigators and bombardiers on approach to targets. The oblique gives them a very good idea of what the ground will look like as they fly toward the target.

PHOTOMAPS.—Photomaps are classified into two types: Mosaic and composite. A mosaic photo map is an assembly of two or more overlapping vertical photographs properly assembled and is the most common form of photo map. It often serves as a map substitute or supplement and gains importance when a topographic map of the area does not exist

1312

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

or when it is desired to show current conditions or details not shown on existing maps.

In intelligence studies, the mosaic is adaptable to studying ground features which cannot be followed out completely on a single photograph.

A composite photograph is made by joining several photographs taken at a single camera position and transforming them to a common plane. A multi-lens camera is usually employed in taking composites.

A photomap is a single photograph, composite or mosaic to which has been added grid, marginal and place-name data, and produced in quantity by contact print or lithography.

Scale Models

Scale models are exceptionally useful and at times very necessary in the preparation and briefing of certain types of missions, either aerial bombing missions or ground attacks. Such was the case in the preparations made before D-Day. Months ahead of the invasion date, relief models (plaster, rubber and sand) were made of the area to be invaded and all the ground troops, including airborne, were constantly briefed and trained to land and fight in a manner most advantageous to them in that locality. Models made it possible for men to know the exact location and distance of every building, road, and gully that might afford them protection in their advance.

Models were also employed in the planning of amphibious assaults. These models were sponge rubber with terrain features, houses, etc., painted in their natural colors. In the CBI the employment of native troops made models an absolute necessity. Gurkha airborne troops had to be shown by means of models where they would land and what they were to do when they got there.

SUMMARY

Proper selection of targets is and will continue to be a most important factor in determining the successful accomplishment of the mission of Air Power.

As a major conflict will mean global war, all steps must be taken to achieve complete world coverage. Maximum benefit from our Air Power cannot otherwise be achieved.

Target material required for training and briefing crews for missions must be as complete and as practical as possible.

CHECK LIST TO BE USED IN THE PREPARATION OF A STRATEGIC VULNERABILITY CATEGORY STUDY

Summary and Conclusions

(Brief and unqualified restatement of findings.)

Importance of Industry or Service in the National or Regional Economy

a. Relative Size and Significance:

1. Value of product as % of national output.
2. Employment as % of national labor force.
3. Rank in value of output in employment, etc.
4. Output, capacity, mileage, etc., as % of world.

b. Use Pattern of Product.

1. Function of product or service in general terms:

(*a*) Types of uses.

(*b*) Indispensability—existence of alternate or substitute products or services.

2. Use pattern in as precise and graphic form as possible:

(*a*) Non-essential civilian:
(1) Present peacetime.
(2) Probable future war.
(*b*) Non-essential military:
(1) Present peacetime.
(2) Probable future war.
(*c*) Essential civilian:
(1) Present peacetime.
(2) Probable future war.
(*d*) Essential military:
(1) Present peacetime.
(2) Probable future war.

c. Export/Import Position of Product.

d. Place in National Policy:

1. Active government support—subsidy, priority, etc. Attachment 2 to AF Regulation 200-25.

2. Place in war planning:

(*a*) Expansion or contraction.

(*b*) Protection.

(*c*) Stockpiling of supplies or products or equipment.

(*d*) Maintenance of essential imports.

3. Potential contribution to possible allies or invaders.

1313

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Structure of Industry

a. Output and Capacity. (Tabular presentation is essential.)

b. Number, Location, and Size Distribution of Plants and Installations. (Presentation by maps and graphs is essential.)

c. Input needs.

1. Materials.
2. Power.
3. Components.
4. Basic Equipment.
5. Transportation.
6. Manpower.

d. Technical Characteristics.

1. Description of processes or activities.
2. Description of typical equipment and installations.
3. Organization:
   (*a*) Industrial integration.
   (*b*) Administrative controls.
4. Efficiency of industry.

Vulnerability Factors and Force Requirements

a. Vulnerability Factors. (These are mainly economic factors deduced from sections "Importance of Industry or Service in the National or Regional Economy" and "Structure of Industry."

1. Essentiality of product or service.
2. Essentiality of current production or operation:
   (*a*) Ratio of consumption or wastage to total holdings.
   (*b*) Stocks and reserves:
      (1) Normal proportion of stocks to rate of consumption.
      (2) Feasibility of stockpiling.
   (*c*) Imports.
   (*d*) Ratio of current production to consumption.
3. Dependence on supplies and services:
   (*a*) Transportation arteries.
   (*b*) Power and fuel sources and conduits.
   (*c*) Raw materials, supplies: Domestic and imported.
   (*d*) Subcontractors.
   (*e*) Manpower.
4. Concentration and accessibility of installations. (Maps essential.)
   (*a*) Of major plants.
   (*b*) Within urban areas.
   (*c*) Within major regions.
   (*d*) Dispersal forecast.
   (*e*) Concentration of production of single critical products or services within the industry.
5. Physical Vulnerability:
   (*a*) Manpower.
   (*b*) Buildings.
   (*c*) Processes and equipment.
   (*d*) Underground potentialities.
6. Resilience:
   (*a*) Time factor: Period of grace allowed by depth in pipeline and by cushion of stocks, sustitution, excess capacity, etc.
   (*b*) Individual plants:
      (1) Rebuilding.
      (2) Equipment replacement and repair.

Questions and Leads for Classroom Discussion

1. Air Objective Folders are applicable to what types of missions?
2. What were the two methods employed in the standardization of material for Air Objective Folders?
3. When will an Air Objective Folder be taken into the air?
4. What is a target chart?
5. What are the three different ways target charts are used?
6. Target strips are usually provided by?
7. Name three advantages of aerial photos.
8. What is a scale model used for?
9. How are they constructed?

1314

THIS PAGE IS UNCLASSIFIED

CHAPTER XIX

STAFF DOCTRINES AND FUNCTIONS— WING LEVEL AND BELOW

GENERAL FUNCTIONS OF A STAFF

The staff of any unit consists of the officers who assist the commander in his exercise of command.

The staff procures and furnishes information required by the commander, prepares the details of his plans, translates his decisions and plans into orders, and causes such orders to be transmitted to those affected. Within the scope of its authority, the staff supervises the execution of plans and orders and takes such other action as is necessary to carry out the commander's decisions.

Each staff officer must have a thorough knowledge of the policies of his commander and should be acquainted with subordinate commanders and their units, and with the personnel of higher, lower, and adjacent units.

Command Responsibility

The commander alone is responsible to his superior for the performance of his unit.

All orders from a higher to a subordinate unit are issued by the commander of the higher unit to the commander of a subordinate unit.

In order to expedite the execution of orders and to promote teamwork between units, a commander may authorize his staff officers to communicate directly with staff officers of other units on details of orders issued or received.

Organization

a. Basis: The organization of a staff is based upon the duties of the commander. Although personnel strength at headquarters is shown in Tables of Organization or Manning Tables, detailed assignments of personnel to sections, particularly in the general staff group, will be made by the commander.

b. Duties: The duties of all commanders in wing levels and below can be divided into four principal

1315

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

functions: Personnel, Intelligence, Operations and Training, Supply and Evacuation. In each duty the commander is assisted by a specialized staff officer. Coordinating the work of staff members and directly responsible to the commander, is the executive.

c. Executive: The executive is the chief assistant and advisor to the commander. As the principal coordinating agent of the command, he may himself execute the orders of the commander or he may delegate their accomplishment to other staff members.

d. Forward and Rear Echelons: In advance areas, the staff is sometimes divided into two echelons. The forward echelon, consisting of the elements of the staff immediately required by the commander for tactical operations; the rear echelon, consisting of the remainder of the staff, chiefly administrative officers.

Cooperation and Flexibility

Teamwork is essential within and between all sections of a general and special staff, and between the staffs of higher, lower, and adjacent units. This can be furthered by frequent staff conferences so long as they do not interfere with the performance of essential duties.

Although a staff is organized in sections, staff functions overlap; coordination and prompt interchange of information, therefore, are essential. Every staff officer must be thoroughly conversant with the duties of other staff officers, as at times he may be required to assist or to take over, in whole or part, other staff sections.

Authority

A staff officer as such has no authority to command except in his own staff section. All policies, decisions, and plans whether originating with the commander or with the staff must be authorized by the commander before they are put into effect. When a staff officer by virtue of delegated authority issues an order in the name of the commander, responsibility remains with the commander even though he may not know of the order.

Two channels exist in every command: Staff and Command. Through the staff channels pass suggestions and recommendations from one staff officer to another. Through the command channel pass orders of the commanding officer.

STAFF FUNCTIONS OF THE AIR INTELLIGENCE OFFICER

Responsibility

The primary function of the intelligence section is to keep the commander and all others concerned informed of the enemy situation and the enemy's capabilities.

Initiative

Immediately upon assumption of his duties, responsibility rests with the intelligence officer on his own initiative to obtain information on every phase of the enemy situation and capabilities. He will strive to obtain information that will answer every question on the enemy that may arise in the commander's mind prior to specific requests for that information by the commander. His duties will not be executed properly if he awaits detailed direction from the commander as to what information is required.

COMPLETED STAFF WORK

Completed staff work is the study of a problem, and presentation of a solution, by a staff officer, in such form that all that remains to be done on the part of the head of the staff division, or the commander, is to indicate his approval of the completed action. The words "completed action" are emphasized because the more difficult the problem is, the more the tendency is to present the problem to the chief in a piece-meal fashion. It is the duty of a staff officer to work out the details. He should not consult his chief in the determination of those details, no matter how perplexing they may be. He may and should consult other staff officers. The product, whether it involves the pronouncement of a new policy or affects an established one, should, when presented to the chief for approval, be worked out in finished form.

1316

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

The impulse which often comes to the inexperienced staff officer to ask the chief what to do recurs more often when the problem is difficult. It is accompanied by a feeling of mental frustration. It is so easy to ask the chief what to do, and it appears so easy for him to answer. Resist that impulse. The staff officer will succumb to it only if he does not know his job. It is his job to advise his chief what he ought to do, not to ask him what should be done. The chief needs answers, not questions. The staff officers' job is to study, write, re-study, and rewrite until he has evolved a single proposed action—the best one of all he has considered. The Chief merely approves or disapproves.

The staff officer should not worry his chief with long explanations and memoranda. Writing a memorandum to the chief does not constitute completed staff work, but writing a memorandum for the chief to send to someone else does. The views evolved should be placed before him in finished forms so that he can make them his views simply by signing his name. In most instances, "Completed Staff Work" results in a single document prepared for the signature of the chief, without accompanying comment. If the proper result is reached, the chief will usually recognize it at once. If he wants comment or explanation he will ask for it.

The theory of "Completed Staff Work" does not preclude a "rough draft," but the rough draft must not be a half-baked idea. It must be complete in every respect except that it lacks the requisite number of copies and need not be neat. But a rough draft must not be used as an excuse for shifting to the chief the burden of formulating the action.

The "Completed Staff Work" theory may result in more work for the staff officer, but it results in more freedom for the chief. This is as it should be. Further, it accomplishes two things:

a. The chief is protected from half-baked ideas, voluminous memoranda, and immature oral presentations.

b. The staff officer who has a real idea to sell is enabled more readily to find a market.

When a staff officer has finished his "Completed Staff Work," the final test is this:

"If you were the chief would you be willing to sign the paper you have prepared, and stake your professional reputation on it being right?"

If the answer is in the negative, take it back and work it over, because it is not yet "Completed Staff Work."

Questions and Leads for Classroom Discussion

1. What is the function of the Commander's Staff?
2. What is command responsibility?
3. What is meant by cooperation and flexibility?
4. What authority does a staff officer possess?
5. What two channels exist in every command?
6. What is "Completed Staff Work"?

1317

CHAPTER XX
INTELLIGENCE RESPONSIBILITIES IN LOWER ECHELONS OF COMMAND

THE STAFF INTELLIGENCE OFFICER AND SECTION

The general responsibilities of the staff intelligence officer are practically the same throughout all echelons. The specific duties performed in intelligence sections in bomber, fighter, troop carrier and other type units vary with the size of the unit and the nature of its mission. In the higher echelons of command, responsibilities become broader and more general, and intelligence estimates and plans must reach farther into the future. In order to simplify and standardize reports and maintain uniform intelligence procedures in subordinate units, the staff intelligence officer for the air commander and for each of the highest bomber, fighter, reconnaissance, and other functional units, establishes intelligence policies and SOP's. Technical specialists, such as photo interpreters, translators, and electronic engineers, may be assigned or attached to intelligence sections to assist the intelligence officer. Immediate intelligence requirements are dictated by the unit's mission and the work and assignments of individuals and sub-sections are adjusted to the situation.

SQUADRON INTELLIGENCE

The basic administrative and tactical unit of the air force is the squadron. Administrative duties of the combat squadron intelligence officer are limited. Most of his efforts are devoted to preparation for air operations. Since the squadron rarely operates away from the group but simply executes orders and flies the assigned mission, the squadron commander is not required to make decisions regarding priority of objectives. Target information is furnished by higher headquarters. As a result the squadron commander requires little advice from his intelligence officer, who serves more as an advisor to air crews and collects information from flying personnel. The briefing and interrogation of aircrews are also supervised by the group. In fact, when the squadron is operating close enough to the group, the group intelligence officer may assume this responsibility

1318

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

for briefing and interrogation and the squadron intelligence officers become, in practice, assistants to the group intelligence. The primary collection agencies for combat information are combat squadron and group intelligence sections. During peacetime, combat situations should be simulated for training purposes. If an intelligence officer is assigned to non-combat squadrons, his principal concern is security of the unit and its installations.

Duties of Squadron or Group Intelligence Officers

The specific duties of the intelligence officer of a squadron (or group) are:

a. Maintains informal personnel records (histories, capabilities, and efficiency records of personnel of the section).

b. Assigns definite duties to personnel in the section.

c. Is responsible for the security and storage of all written matter and equipment in the section, including correspondence, enemy information, maps, supplies, purses, escape kits.

d. Maintains supplies of maps, charts, drafts, plots, and target strips necessary for operations.

e. Maintains a supply of equipment for the section.

f. Handles intelligence training aids, recognition material, periodicals, publications, maps, photographs, and other data for combat personnel.

g. If directed by the commanding officer, keeps information on crew members for consideration in the awarding of decorations.

Intelligence Training of Unit Personnel

The intelligence officer is responsible to the commanding officer for the intelligence training of all personnel of the unit. Direct instruction is conducted either for individuals or groups. Training is done continuously by displaying graphic training aids. Personnel must be kept current on combat information through news bulletins, open forums, or other types of presentations.

Knowledge of the Enemy

a. Maintains a war (situation) room.

b. Obtains, summarizes, and disseminates information of the enemy, including information about:

1. Air fields and air installations.
2. Ground and naval forces.
3. Aircraft.
4. Air tactics.
5. Radar system.
6. Anti-aircraft artillery.
7. Searchlights.
8. Barrage ballons.
9. Rockets and guided missiles.
10. Decoys, dummies, camouflage, and smoke screens.
11. Potential targets.
12. Special weapons (atomic, biological, etc.)
13. Press and radio releases.
14. Propaganda and psychological warfare.

c. Maintains information on the enemy air order of battle (as much in graphic form as possible) including:

1. Identification of enemy units.
2. Aircraft and unit insignia.
3. Historical data regarding enemy units and their commanders.
4. Types of aircraft with their serviceability, armament, equipment, and performance data.
5. Enemy air tactics.
6. Combat efficiency of enemy air crews.

d. Prepares estimate of enemy air reaction.

e. Keeps situation map showing:

1. Location and strength of enemy units.
2. Territory under enemy, neutral, and friendly control.
3. The location of enemy airfields.
4. The location of enemy barrage balloons.
5. Location and range circles of enemy anti-aircraft artillery.
6. Location of launching sites and range of ground launched missiles.
7. Zones covered by enemy radar-warning net.
8. Additional information that can be effectively shown on the map.

f. Maintains and keeps up-to-date objective folders for each potential target containing:

1. Target map.
2. Description of the target.
3. Photographs of the target.
4. Summary of experiences of previous operations on the target.
5. Defenses at the target.
6. Other information.

1319

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Knowledge of the Friendly Situation

a. Obtains, keeps up-to-date, and disseminates information on the friendly situation including:

1. The location of our own front line.
2. Location of strategic and tactical bomb lines.
3. The friendly communications net.
4. The location and strength of our own and Allied air, ground, and naval units, including location of friendly airfields.

Briefing of Air Crews

a. Establishes adequate facilities for the briefing.

b. Conducts the briefing as directed by the commanding officer.

c. Prepares intelligence briefing data including:

1. The target.
   (*a*) Importance.
   (*b*) Purpose of the mission.
   (*c*) Landmarks and other target identification.
   (*d*) Aiming points.
   (*e*) Bomb-damage assessment and other results or previous attacks.
   (*f*) Prisoner of war camps, hospitals, churches, etc. in vicinity.
   (*g*) Secondary target and targets of opportunity.
2. Bombing line (s), bomb dumping area, safe-landing area, and neutral areas.
3. Enemy ground defenses at the target and enroute.
   (*a*) Anti-aircraft artillery, location and capabilities.
   (*b*) Barrage balloons.
   (*c*) Searchlight areas.
   (*d*) Anti-aircraft missiles.
   (*e*) Radar stations.
   (*f*) Fighter airdromes and fields.
   (*g*) Camouflage, including dummies, decoys, smoke screens, fires.

4. Enemy recognition procedure.
5. Escape and evasion technique.
6. Procedure if captured.
7. Destruction of aircraft and equipment if forced down.
8. Survival, search and rescue.
9. Friendly balloon barrages, anti-aircraft and missile areas, restricted flying areas, friendly convoys and shipping.
10. Issuing of target charts, maps, flimsies, and escape kits.
11. Handling personal papers, diaries, and valuables of crew members prior to flight.

Interrogation of Air Crews

a. Interrogates combat crews on their return from missions in order to:

1. Determine the results of the mission.
2. Obtain information on the performance of the unit.
3. Obtain combat information, knowledge of the enemy, and statistical data.
4. Obtain information for public relations, unit records and histories, and for awarding decorations.

Reporting

a. Prepares, transmits, and disseminates, as directed:

1. Flash reports (information demanding immediate action, such as friendly aircraft or personnel in distress or important enemy activities).

1320

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

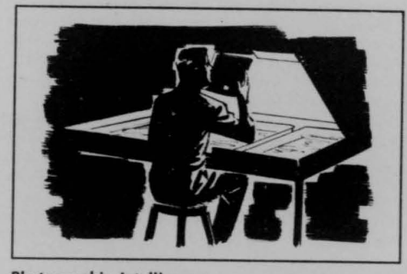
THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

2. A preliminary summary of the mission.

3. Complete report of the mission, including encounter reports and statistics.

4. Such special reports as may be necessary.



Photographic Intelligence

a. Maintains facilities for the immediate development of mission or strike photos.

b. Supervises the rapid development and transmission of prints of mission or strike photos, as directed.

c. Gives a first-phase interpretation of mission or strike photos for the commanding officer, crews, and tactical and technical personnel.

Capture Intelligence

a. Notifies air technical intelligence units or air prisoner of war interrogation units of the capture of enemy air materiel or personnel.

b. In accordance with theater and air force SOP, supervises handling of captured enemy materiel and personnel.

1. Safeguards captured materiel pending release to authorized air technical intelligence units.

2. Segregates and guards prisoners.

3. Searches prisoners and inventories and removes all personal effects, such as papers, ticket stubs, maps, photographs, and other documents, for inspection by authorized personnel.

4. Prevents any fraternization with prisoners.

Security

a. Supervises the handling of classified materiel including maps, photographs, codes; prepares for their removal or destruction in case of necessity.

b. Instructs all unit personnel in the maintenance of security (AR 380-5, "Safeguarding Military Information").

c. Supervises censorship.

d. Advises the commanding officer and staff officers concerning:

1. Unit Defense Plan.

2. Camouflage and concealment and camouflage discipline.

3. Dummies and decoys.

4. Disposal of equipment, installations, and personnel.

GROUP AND WING INTELLIGENCE

The group intelligence officer supervises the intelligence sections of its squadrons, coordinating their activities. He prepares group reports, such as the consolidated mission report. He obtains intelligence data and transmits it to the squadrons. In the group he has the staff responsibility for all duties listed under duties of squadron intelligence.

When ordered by the commander, he assumes direct control of squadron intelligence and the squadron intelligence officers act as his assistants.

The wing controls, administers, and services an air base and assigned units. It usually consists of a tactical group, a maintenance and supply group, an airdrome group, a station hospital, and other necessary service and technical organizations. The wing intelligence officer has staff responsibilities similar to those that the intelligence officer has in a squadron or a group. Unlike the group intelligence officer, however, he does not assume intelligence responsibilities for lower units. His principal functions are consolidation of intelligence reports from subordinate units, and distribution of intelligence received from other headquarters.

IMPORTANT FUNCTIONS IN VARIOUS TYPE UNITS

In bomber units all operations must be directed toward the bombing of enemy targets. Since target

132

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

information is naturally of vital importance to each echelon of command, a target section must be organized in each intelligence section to fulfill requirements. Briefing combat air crews also requires accurate information about enemy defensive capabilities and tactics.

Strategic Targets

Although target information (air estimates, air objective folders, target folders, target charts, photographs and models), target assignments, and target priorities may be given by higher command, including the Chief of Staff, United States Air Force, considerable personnel are required in the target section of the senior strategic bomber unit in each theater. Target analysis consists of the following steps:

a. Analysis of the entire enemy industrial economy to find vulnerable strategic target systems.

b. Analysis of selected target systems to determine priorities.

c. Maintenance of information on designated targets. The first and second stages of strategic target selection are being continuously performed by Headquarters, United States Air Force, but once combat operations are undertaken, a certain amount of this work must be performed in each theater. Industrial and military experts in many fields are required to choose targets, assign priorities, determine the effect of air strikes, and maintain up-to-date objective and target folders. Combat operations will, of course, make it necessary to revise target information continuously. Combat intelligence will reveal new targets and change target priorities. Periodic photo reconnaissance missions should be planned to furnish adequate photo coverage.

Air force, air corps, and air division bomber commanders will normally be allowed some latitude in their directive and occasionally may have full authority to pick their own targets. The intelligence staff of each commander should be organized so that it can help him select targets and furnish subordinate units with objective and target folders. When the situation is static and headquarters is relatively near, the senior echelon may analyze targets, study bomb damage, and revise, print, and distribute folders and other target data for subordinate units.

Since bomber groups merely carry out assigned missions, their principal responsibility for target information is to pass it on to squadrons and air crews, interrogating crews concerning operations and conducting flash interpretations of strike photographs.

Tactical Targets

Information on tactical targets, like information on strategic targets, may be given to the senior tactical air commander by higher command. During combat operations, each independent tactical air commander will develop within his command, usually as a result of operations, the intelligence necessary to select targets and assign priorities. Tactical photo reconnaissance missions must be planned for army as well as for air units. Full advantage should be taken of all strategic photos available. Adequate communication facilities must be established at all echelons of command to transmit target information rapidly, especially information about transient and moving targets. The intelligence section of the senior air echelon in each area or task force analyzes target information and furnishes up-to-date objective folders and target charts for all units. Subordinate units, including groups, maintain photo laboratory facilities so that they can interpret photos for their immediate needs or the combat intelligence requirements of higher headquarters.

Tactical air operations are often conducted jointly with Army operations. If air units are to furnish close support, especially in a moving ground

1322

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

situation, there must be careful planning with the ground commander, good ground-air communication facilities, and thorough briefing of air crews. The intelligence officer of each air unit that operates with a ground unit must brief air crews as to the location of the front line, location of each friendly unit, and the contemplated movements of our front line, in addition to all necessary enemy information. Tactical air operations with ground units may frequently become decentralized, the air division being given control over light bomber and fighter units. In such cases, the air division intelligence section will be required to supply complete data on new targets and produce target charts and photos for air crews.

Fighter Units

Although the fighter is designed to seek out and destroy enemy aircraft in the air and on the ground, it can also be used effectively to bomb and strafe other surface targets. Moreover, even though the fighter is inherently an offensive weapon, fighter units may be employed in purely defensive roles, such as when they escort bombers or air transports. On an escort mission, the intelligence officer is primarily concerned with information on enemy air order of battle, and characteristics, performance, and tactics of enemy fighters and other anti-aircraft weapons. For bombing and strafing missions he must obtain, in addition, adequate target information. When fighters are used against targets close to the front lines, particularly when employed in close support of Army troops or amphibious landings, detailed knowledge is required of the ground situation in order to brief air crews. Sometimes it may even be necessary for liaison officers from the Army to assist by briefing crews on the exact ground situation.

Air Defense Units

In combat zones the tactical air commander uses his fighter aircraft for both tactical missions and air defense. In the rear of the combat zone air defense is the responsibility of the air defense commander. In air defense the functions of the intelligence officer differs from those in other fighter units. He is not concerned with target information. There is, of course, no time for the intelligence officer to brief fighter crews when enemy aircraft are reported. Intercept bearings, altitudes, and other information concerning hostile aircraft must be radioed to the fighters while they are aloft. Only before routing combat air patrols is there time for briefing. In air defense the primary mission is air fighting and other anti-aircraft action. No special organic reconnaissance units are assigned. The air defense commander controls aircraft warning services and anti-aircraft units and coordinates passive defense measures but he depends on other air commands for intelligence, augmenting this with information from interrogating his own air crews. He must train his air crews in intelligence between alerts, stressing information such as enemy air tactics, recognition, aircraft characteristics and performances, and enemy strong points and weaknesses.

Troop Carrier Units

In combat areas troop carrier units furnish air lift for airborne operations and for air supply. To do this they must cooperate closely with ground units and with other air units, particularly escort fighters. When the troop carrier units are preparing for a drop, they need detailed information on enemy defenses and the general suitability of the area as a drop zone (DZ). The intelligence officer requests detailed air reconnaissance and photographs (both vertical and oblique). He also assists the Army unit in getting the information it needs. Detailed maps and photos are prepared for each air crew. Scale models of the DZ's are helpful for briefing. If such models are not furnished by higher headquarters, they should be constructed by the squadron and group intelligence officers.

Reconnaissance Units

Reconnaissance units obtain information by photographic, visual, and electronic methods. Aerial photographs are by far the most important source of information about the enemy because they give the most details and are the most reliable. Intelligence officers in reconnaissance squadrons and groups brief air crews on the area to be reconnoitered and interrogate returning crews. In units that have field laboratory facilities, the intelligence officer supervises first-phase flash photo interpretation and forwards prints, negatives, and flash reports to agencies as directed. Speed is essential in handling tactical photographs. The principal functions of reconnaissance squadron and group intelligence officers are to advise flying personnel and obtain information from air crews. The staff intelligence officer of the division furnishes the group with briefing data and other intelligence material; maintains a basic intelligence reference library for photo interpretation and a negative and print library; co-

1325

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

ordinates the handling of photo material by photo laboratories; and supervises liaison with combat units for whom reconnaissance is being made. His most important functions are to coordinate collection, evaluate and interpret information, and disseminate photo intelligence, especially aerial photographs secured by reconnaissance units.

Military Air Transport Service

Military Air Transport Service units furnish logistical support, especially the movement of materiel and personnel by air. In time of war, the transport planes must sometimes enter combat areas as they fly from one theater of operations to another. The combat intelligence functions of an intelligence officer in MATS unit will depend upon how much likelihood there is that its planes will encounter the enemy.

NON-COMBAT AREAS. The intelligence officer of a unit operating in a non-combat area is principally concerned with training of the unit and with briefing air crews and passengers concerning survival and search and rescue procedure.

COMBAT AREAS. As just pointed out, MATS flights may pass through areas where the enemy is capable of offering air opposition. In such areas the intelligence officer must find out what the enemy's offensive capabilities against transport aircraft are. He gets his information normally from air force headquarters, air defense control centers, or adjacent bomber or fighter units within the theater. This information is supplemented by data obtained from interrogation of transport air crews. In those areas where enemy opposition is possible or where reconnaissance may be made, the intelligence officer briefs, interrogates, and reports in a manner similar to that in a combat unit.

Service and Technical Units

Since service and technical units provide maintenance and services for tactical units and bases, their principal command responsibility for intelligence is advising the commander on security measures and safeguarding information. This latter function is important especially in overseas theaters during wartime when units which operate technical services, such as overhaul and maintenance of air materiel, are sometimes directed to analyze, test, and report on foreign air equipment. Units that operate electronics detection devices and whose basic mission is collecting information, evaluate the information only from its technical aspects. When the information gathered by technical units reaches higher echelons, the staff intelligence officer may call upon specialists who can help him evaluate it.

Questions and Leads for Classroom Discussion

1. What dictates the intelligence requirements of the unit?
2. Who furnishes target information to the squadrons?
3. What are the primary collection agencies for combat information?
4. Who is responsible for intelligence training of unit personnel?
5. Discuss the specific duties of the squadron intelligence officer.
6. Discuss important intelligence functions in various type units.

CHAPTER XXI

BRIEFING OF COMBAT CREWS

DEFINITION AND PURPOSE

Briefing is the organized presentation of information which has been processed into mission intelligence. It is presented to air crews prior to their departing on a mission.

The purpose of briefing is to give crews information that will enable them to accomplish the mission and return safely.

In heavy bombardment, anti-submarine, troop carrier and other units where missions are planned in advance, briefing should commence from three to three and one-half hours before take-off. In fighter and air support units, necessity for a quick take-off may make formal briefing impossible; but when there is no cause for hurry, it is advisable to allow ample time between briefing and take-off to enable crews to confer, to mark their maps and charts properly, and to assemble personal flying equipment. The time between briefing and take-off, however, should never be so great as to permit information to leak to the enemy.

The briefing room should be large enough to seat all combat personnel. It should be well-lighted, but so prepared that it can be darkened for projections.

Equipment should include large-scale maps, aeronautical charts of friendly and enemy territory, perspective target charts and landfall strips, all prominently mounted near a platform from which briefing officers may speak.

Complete reference material should be included in files. Special reports on enemy installations such as runways, revetments, ammunition, gasoline and supply dumps, personnel areas, smoke screens, dummies and decoys, balloon barrages, flak and searchlight positions and other data should be easily available.

Equipment should include a balopticon (epidiascope) and screen for projecting, on as large a scale as possible, maps and photographs of the target area and identifying landmarks; it should include a portable blackboard and facilities for collecting personal belongings of combat crews and for distri-

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

bution of pilots', bombardiers' and navigators' kits, pouches and escape kits.

BRIEFING PROCEDURE

The commander may prefer to conduct the entire briefing himself, relying on his staff to furnish him the necessary information. Frequently, however, the commander opens the briefing, announces the objective and comments generally on the mission; then other staff officers, including intelligence officers, brief on specific phases of the operation. In some units, intelligence officers may be called upon to conduct the entire briefing, supplemented by additional comments from the flight leader.

Typical procedure in bomber unit:

a. Commander opens the briefing, announces the mission and, in a large operation, discusses the part the unit is to take.

b. Commander or S-3 explains the operational plan: Timing, taxi and take-off procedure, formations, other units participating, escort, rendezvous, method and altitude of attack, routes to and from the target, etc.

c. Intelligence officer briefs on special subjects.

d. Communications officer briefs on radio procedure and reviews pertinent signal instructions.

e. Unit navigator discusses route out and back.

f. Weather officer and, possibly, ordnance officer brief on their specialities.

g. Commander summarizes.

h. After the general briefing, special briefings or group conferences are usually held with pilots and co-pilots, navigators, bombardiers, radio operators and, possibly, air gunners.

PREPARATION FOR BRIEFING

Certain principles are basic in any briefing.

a. Subject to the approval of the C.O., briefings are usually planned by intelligence officers working with S-3, with aid from other staff sections. In such cases, the intelligence officer should submit a program to the commanding officer prior to each briefing and advise each participating officer of his part.

b. In a well-planned briefing, each officer will confine his remarks to his specific subject, thereby avoiding duplication. Unnecessary repetition must be avoided.

c. Briefing will be matter-of-fact and to the point. All pertinent facts must be included and stated as simply and directly as possible.

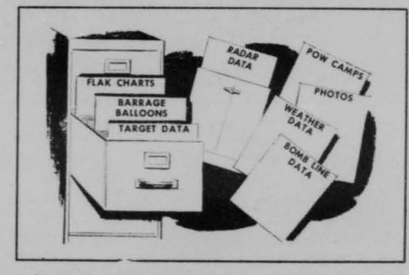
d. Briefing should be concise. Brevity and clarity are all important. Nothing should be introduced that does not pertain to the immediate mission. Instruction on general intelligence subjects, such as recognition and principles of A A fire, should have been given in earlier periods of training.

e. Visual aids are invaluable, but only when unmistakably pertinent and well-organized. Basic subjects to be covered include:

1. Importance of the target, and the effect its destruction will have on the enemy.
2. Landmarks, checkpoints and target identification features.
3. Enemy defenses, which should be described calmly, pictorially and precisely.
4. Friendly situation, which should include restricted areas, aids to navigation, bomb line, friendly aircraft and shipping that may be encountered on the mission and recognition procedure.
5. Positions and formations to be flown.
6. Weather.
7. Radio procedure and signals.
8. Routes and bombing procedure.

Immediately on receipt of mission order intelligence should:

a. Study field order (operations or combat order).



b. Procure the folders, charts and photographs of the target.

c. Assign assistant intelligence officers to specific duties.

d. Supervise posting of maps, and charting of route.

e. Ascertain that the balopticon operator knows the sequence of target maps, photographs, etc., and the exact positions to be projected.

f. Telephone higher headquarters or other sources

1326

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

for latest information on flak, enemy fighters, location of bomb line and other data.

g. Prepare a reference check list to assure that no important information is omitted in the briefing.

In certain theaters one or a few officers may do all the briefing, particularly where the unit of operation is as small as a group or squadron. For larger missions, the tendency is towards specialization.

Subjects on which intelligence briefs

For a heavy bomber group on an ordinary mission, intelligence will probably discuss:

a. Targets—primary, alternate and last resort—and their strategic importance; identification of targets from various air approaches, and exact aiming point for each flight or squadron.

1. Results of recent attacks on the targets. (Illustrated with photographs and slides)

2. Targets of opportunity that may be found in target area.

3. Prisoner of War camps or other restricted areas in target vicinity.

4. Outstanding terrain features such as waterways or valleys that might aid navigation to or from target, or mountains that might be obstacles to the mission.

5. Elevation of target.

6. Information on tides, if pertinent.

b. Bomb Line (BL) is a line beyond which any target may be attacked without danger of bombing friendly ground forces. During movements in forward areas, bomb line is fixed daily by higher headquarters. There are two bomb lines: *Strategic,* which is the more permanent and effective throughout the theater, and *tactical,* which may vary from hour to hour and is only used by air units directly engaged in ground support. The intelligence division must at all times know the location of front lines, friendly and enemy positions, patrols, and ground fighting. For ground support operations the intelligence officer must keep his crews constantly informed of the exact location of the tactical bomb line, and the areas in which they may and may not attack. He may have to establish his unit's tactical bomb line through direct liaison with ground units or through the A.L.O.

c. Enemy ground defenses to, from and at targets. Flak on recent mission.

1. Battery positions if the area is lightly defended, or areas in which flak is located if defenses are numerous.

2. Type of weapon: Guns, automatic weapons, or small arms.

3. Accuracy.

4. Amount of fire: Meager, moderate, or intense.

5. If the fire was from guns it should also be stated whether the fire was "seen" or "unseen," whether it was barrage, plotted concentration, or continuously pointed fire, and the altitude of the bursts.

6. Barrage balloons.

7. Searchlight areas.

8. Radar stations.

d. Enemy air defenses.

1. Total number of enemy fighters within operational range of route to target, the target itself, and route back.

2. Fighter standing patrols.

3. Latest enemy tactics.

4. Possible enemy use of reclaimed Allied aircraft.

e. Enemy passive defenses.

1. Camouflage.

2. Dummy installations.

3. Decoys.

4. Smoke and fire.

5. Enemy recognition procedure.

f. Security measures.

1. Deposit of personal papers, diaries, etc., before take-off.

2. Disposition of aircraft and documents in event of forced landing.

3. Instructions in event of capture.

g. Mention of escape and evasion technique in event of landing in enemy or neutral territory.

1327

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

b. Special air-sea rescue instruction.

i. Requests for specific information desired by commander or by intelligence.

j. Friendly situation.

1. Balloon barrage areas.
2. Restricted flying areas.
3. Position of friendly convoys.
4. Position of other friendly shipping.
5. Free bombing areas.
6. Other friendly aircraft operating in mission area.

k. Any other special information.

Separate Briefing for Gunners

In heavy bomb groups separate briefing for gunners may be held simultaneously with the main briefing. This separate briefing is conducted by an intelligence officer with the assistance of the gunnery officer and will ordinarily cover the following points:

a. Name of target and explanation of its importance.

b. Route in and out and timing.

c. Enemy fighter types which may be encountered and their expected tactics.

d. Enemy defenses.

e. Friendly fighter support-types and tactics, and caution against firing on them.

f. Possibility of enemy using captured friendly aircraft.

g. Review of possible stoppages and malfunctions of guns and equipment.

h. Importance of making and reporting observations.

Briefing for sea search or anti-submarine mission follows procedure similar to that for bomber mission except that information relates to sea rather than land defenses and targets.

Briefing for fighter interception mission usually is impossible because of necessity for immediate take-off. Intelligence in fighter units must, therefore, have supplied pilots with a continuous flow of "background" information: Enemy aircraft, equipment, performance and tactics; identification of enemy and friendly aircraft, vessels and armored force equipment; geography of theater, flying restrictions and recognition procedure over friendly territory, location of alternate landing fields, evasion methods and escape routes. Intelligence with fighter unit must keep his situation map absolutely up to the minute so that pilots will at all times know latest details of enemy and friendly situation.

Briefing for air-ground support mission will include the maximum amount of ground information, including enemy and friendly installations, ground to air recognition signals, and strategic and tactical bomb lines.

Briefing for reconnaissance or photographic mission will include area to be covered, altitude of target and of flight, time of day for taking photographs and same information of enemy defenses as for combat crews.

Briefing for troop carrier mission will include information given combat crews and, in addition, describe in detail the point of landing (D. Z.—drop zone), altitude of D. Z., altitude of drop, barometric pressure at D. Z., initial point, run-in, and geographic features that might be useful in navigating or harmful in low altitude flying.

Briefing of air transport and ferry crews emphasizes navigational aids, recognition signals, evasion and air-sea rescue technique, as well as health and protection if forced down in isolated territory.

1328

THIS PAGE IS UNCLASSIFIED

RECONNAISSANCE VALUE OF MISSIONS

At briefing, the intelligence officer will ask for any particular information he wishes the crews to bring back. Little information is obtained by a general request, but by making specific requests, the intelligence officer will frequently obtain facts that might otherwise be overlooked or not reported.

Questions and Leads for Classroom Discussion

1. What is the purpose of briefing?
2. Discuss briefing procedures.
3. What preparation should be made for briefing?
4. Discuss subjects on which intelligence briefs in a heavy bomber unit.
5. How is the reconnaissance value of mission realized?

CHAPTER XXII

INTERROGATION OF COMBAT CREWS

PURPOSE

The primary purpose in fighting a war, or a campaign, or even a single battle or mission is to win it. In order to win, a constant flow of precise information is needed on a variety of subjects so that requisite operations can be made more and more effective. The interrogation of combat crews is one exceedingly important source of this information. Therefore, it is highly important not only that it be done, but that it be done correctly.

The purpose of interrogation of combat crew personnel is three-fold:

a. To secure information about your own operations.

b. To secure information about the enemy.

c. To stimulate continued observation on the part of combat personnel.

Interrogation of combat crews has been a very important source of information about the enemy, particularly for data pertaining to the enemy air order of battle, on enemy tactics and reactions, on enemy targets and defenses, and for valuable tips for further research by other intelligence specialists. This is in addition to information of value in regard to our own operations, such as mission results and functioning of equipment.

GENERAL PROCEDURE

Combat crews are interrogated after each mission to determine whether or not the objective was accomplished and to get from them all information of military value they have obtained. Even though the mission or sortie may have been abortive, interrogation should take place to obtain observations of crew members and to determine whether the failure to accomplish the objective was due to personnel factors, malfunction of equipment, weather, enemy action or other causes. As soon as possible after landing, crews are interrogated by the intelligence officer and his assistants. If not radioed in prior to landing, hot news for flash reports are obtained

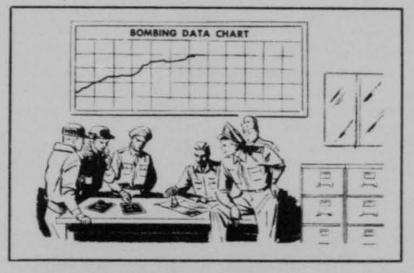
1330

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED



from the crews at their planes, or as they enter the interrogation room. The more comprehensive interrogations are held a bit later and, still later, special interrogation officers may question the crews. The armament officers may question the gunners; group bombardier, the bombardiers; group navigator, the navigators; group engineering officer, the pilots and flight engineers; group communications officer, the pilots and radio operators. In addition, intelligence flak specialists, and electronic specialists may hold separate short interrogations.

On landing, crews must be brought to the place of interview as quickly as possible. On some fields aircraft are widely dispersed and unless transportation is efficiently organized, harmful delays result. Arrangements should be made to supply appropriate refreshments to the crews as soon as they reach the quarters reserved for interrogation. Facilities for interrogation vary, but for bomber crews it is best, when possible, to provide one large room for the reception of all, and a number of small rooms for the separate interrogation of each crew privately. In contrast to such ideal interrogation quarters, the exigencies of combat may require interrogation of crews near their aircraft immediately after landing. In the interest of accuracy, interrogation must take place as soon as possible after return from the mission. Delay serves only to encourage unconscious suggestion between crew members with characteristic modifications or alterations of true and individual impressions of actual occurrences. The interrogation itself should be as brief as is consistent with accurate and complete coverage because the immediate forwarding of the preliminary report to higher headquarters is essential.

Interrogation forms ordinarily are prescribed by higher headquarters. The intelligence officer fills out these forms (see end of chapter) and adds other information he considers of value. During interrogation the intelligence officer should have basic reference materials available, such as maps, charts, target illustrations, and photographs. Silhouettes, pictures, and models of aircraft and naval vessels are useful in checking recognition reports. The interrogation officers must be thoroughly familiar with the general situation within their theater of operation, and know the background and details of the particular mission. Those who cannot attend the briefing should be completely informed concerning details of the mission.

Crews should not be interviewed by anyone prior to their interrogation by intelligence officers. Even the commander should be encouraged to defer any detailed questioning until after the interrogation. Because of their natural interest, combat crews who have not gone on the mission usually are the worst offenders in causing confusion. They should not be permitted to talk to returning crews until interrogation is concluded. Newspaper reporters should not be present and should get their stories afterwards.

Hot News or Flash News of immediate importance must be transmitted to higher headquarters by the swiftest available means. In general, flash news will include such information as:

a. Friendly aircraft down at sea; dinghies or life rafts seen; all friendly aircraft in distress.

b. Enemy convoys, warships, and naval movements.

c. Enemy tank and troop concentrations and movements.

d. Any other urgent or tactical information.

The report should always include:

a. Location of object reported.

b. Description of object reported:

1. Enemy ships: Type, speed and heading.

2. Enemy troops: Approximate number, disposition, and direction of movement.

3. Enemy vehicles: Type, number, disposition, and direction of movement.

c. Time of observation.

d. Height of observation.

INTERROGATION TECHNIQUE

The stress of combat operations and the consequent difficulty of clear and accurate observation poses a great problem for the interrogator. This problem is encountered even in the interrogation of battle-seasoned personnel. The speed of events

1331

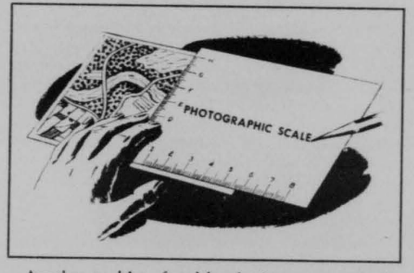
THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

and the complexity of the action or object being observed often make it impossible for personnel to see enough to make a comprehensive and accurate report. Complete descriptions are evolved only by piecing together many bits and pieces of information. In many cases erroneous reports are given to the interrogator in all good faith. In recognition of this human capacity for error, final reports are frequently made by checking the photographs from gun cameras and ascertaining bombing results through the report of the Photo Interpreter.



Another problem faced by the interrogator is the human proclivity to distort facts for personal gain, with the obvious result that the reporting is necessarily inaccurate. Many intelligence officers in the past war were faced with the problem of evaluating interrogation reports that were not all they should have been, claims of enemy aircraft shot down were highly exaggerated, interceptions were inaccurate, bomb drop locations were incorrect, etc. Actually, the individual making a deliberately erroneous or inaccurate report helped only to confuse the picture and possibly prolong the war. No interrogation officer can beat this problem by himself, no intelligence section can carry out good interrogation work without support from the top side. In short, the responsibility for the general calibre of the interrogation and reporting rests squarely on the Commanding Officer.

The personal qualities of the interrogating officer are of great importance. These qualities as listed have no relative importance. They are all of equal importance but not necessarily all inclusive. However, they are qualities worthy of consideration in selecting personnel to interrogate combat crews:

a. Possess the ability to think analytically.

b. Develop an ability to sense items of value (no matter how insignificant).

c. Possess the ability to guide and direct questions.

d. Possess the ability to project an attitude of patience, tolerance, understanding, etc.

e. May be sympathetic, but not "softhearted."

f. Must be scrupulously honest, not a "wishful thinker."

g. Must have a good memory.

h. Should have combat experience of one type or another. These traits are not unusual, nor are they limited to interrogating officers only. But, just as all officers are not all good leaders, so it follows that all officers are not all good interrogating officers. If accurate intelligence information is to be secured from interrogation of combat crews, the initial requirement is the securing or developing of officer personnel who are qualified to do the job.

Questions and Leads for Classroom Discussion

1. What is the purpose of interrogation?
2. Discuss general interrogation procedures.
3. What is a flash report?
4. What should a flash report always include?
5. Discuss the technique of interrogation.
6. What personal qualities should the interrogating officers possess?

INTERROGATION CHECK LIST FOR FIGHTER UNIT

Since fighter missions may be of many types, both offensive and defensive, it is often best for S-2 with a fighter unit to prepare his own check list for each mission. The following list contains some items to be included:

1. Date.
2. Squadron and group number.
3. Number of aircraft operating.
4. Type of aircraft.
5. Mission on which dispatched.
6. Time of take-off.
7. Place of take-off.
8. Time of landing.
9. Place of landing.

If Operating as Part of Larger Formation—

10. Position of unit in formation.
11. Size of formation.
12. Other units and types of aircraft concerned.
13. Time, height and place of rendezvous.
14. Orders given to aircraft after take-off.
15. Course flown.
16. Were enemy aircraft sighted? If so, where?
17. Relative position of enemy when sighted.
18. Numbers and types of enemy.
19. Height, speed, formation of enemy.
20. Weather conditions when enemy sighted.

If Aerial Combat Occurs—

21. Time, place and altitude of engagement.
22. Who attacked first, and how?
23. Defensive tactics used.
24. Course of ensuing combat.
25. Own casualties—aircraft and personnel. *If any pilots failed to return, when and where were they last seen, and what were they doing?*
26. Enemy casualties—
    (1) Number and types of aircraft.
    (2) By whom claimed.
    (3) Circumstances.
27. Aggressiveness of enemy in giving battle.
28. Effectiveness of enemy cooperation and tactics.
29. Camouflage and markings of enemy aircraft.
30. Position of guns on enemy aircraft, amount and type of fire.
31. Unusual tactics employed by enemy.
32. Effectiveness of cooperation between our squadrons.
33. If enemy not engaged, why not?

Offensive Operations Only—

34. Time, height and place of entering enemy territory.
35. Route flown over enemy territory.
36. Enemy land and sea targets attacked—type and location.
37. How was attack carried out?
38. Results of attack observed.
39. Enemy reactions to mission.
40. Enemy antiaircraft fire encountered:
    (1) Location.
    (2) Type (small arms, automatic weapons, guns).
    (3) Intensity.
    (4) Accuracy.
    (5) Special observations.
41. Time, height and place of leaving enemy territory.

General—

42. Anything else of interest seen (land, sea, air).
43. Weather conditions during flight.
44. Any failures of equipment (radio, oxygen, etc.).
45. Reason for equipment failure (to be given only if *certain* that the reason given is correct).

1343

Form 3a

INTERROGATION CHECK LIST FOR TROOP CARRIER UNIT

Interrogation of troop carrier crews does not occur so frequently as interrogation of bomber crews or fighter pilots; but when troop carrier units, as parts of a task or invasion force operation, drop supplies to troops in forward areas or drop troops behind enemy lines, the returning troop carrier crews must be interrogated. Following accomplishment of troop carrier missions of a secondary nature, such as air evacuation of sick and wounded from forward landing strips and hauling freight and personnel, interrogation is not necessary; but S-2 with a troop carrier unit must understand the purpose and the methods of interrogation. He will, of course, prepare his own interrogation form, the one that suits him best, but the following suggested outline may serve him as a guide:

1. Name.
2. Route followed.
3. Visibility and weather conditions encountered during flight.
4. Was briefing adequate (enemy situation, route out, route back, maps, photos, communications, etc.).
5. Troubles encountered in flight.
   (a) Locating D. Z.
   (b) Communications.
   (c) Lights.
   (d) Signals.
   (e) Scheduled time of drop.
   (f) Actual time of drop.
   (g) Scheduled time of release (Glider).
   (h) Actual time of release (Glider).
   (i) Navigational aids.
   (j) Behavior of fighter escort.
   (k) Air discipline (Paratroopers).
   (l) Planned altitude of drop.
   (m) Actual altitude of drop.
6. Enemy activity.
   (a) Intense, moderate or meagre.
   (b) Accurate or not.
   (c) Altitude encountered.
   (d) Location.
   (e) Type of fire (Gun, A/W or Small Arms).
   (f) Fighter.
7. Was the mission successful? If not, why not?
8. Any failures of equipment?
9. Miscellaneous.

CHAPTER XXIII
MISSION REPORTING

GENERAL

Reporting is the first span in the bridge between the collection of information and the dissemination of intelligence. It is a primary function of the intelligence officer. Through reporting, the information secured and consolidated from interrogation of combat crews is transmitted to higher headquarters. There it will be used to evaluate the success of that particular mission, and in the planning of future missions. It also provides a primary source of intelligence information for later dissemination to lower echelons.

Reports from combat units are higher headquarters' only source of information on the results of combat missions. Accuracy, completeness, and speed of transmission are the major factors governing the writing of reports; neglect of any one of these factors may render the entire report worthless.

DISPOSITION OF REPORTS

Mission reports usually originate at group level, are consolidated at higher level, and forwarded to Command or Air Force to be merged with reports of other participating units. The merged reports are analyzed and the substance of them forwarded to the Commanding General, United States Air Forces, Washington. Summaries of these reports, together with other intelligence information, are consolidated and distributed to lower echelons for dissemination to combat crews.

Reports contain classified military information and their transmision must be properly safeguarded. Yet in transmitting "Hot News" reports, the intelligence officer should remember that while codes delay the enemy in securing the information, they also delay receipt of the message at higher headquarters and prevent the taking of the urgent action that is necessary. Moreover, flash radio (in flight) reports are sent in the clear after the target is reached, with the extent of the flash report dependent upon the decision of the commander authorized

1345

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

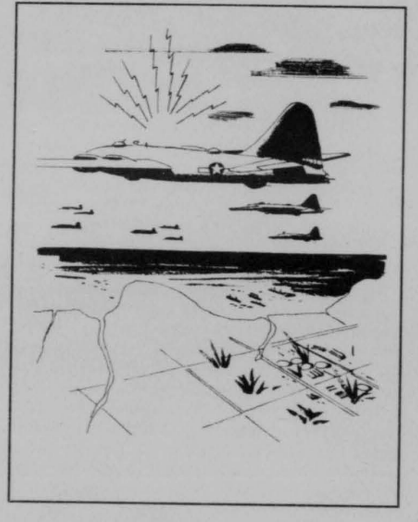
THIS PAGE IS UNCLASSIFIED

to make that decision. *(For report forms see end of chapter.)*

"Hot News" Report

Sent immediately upon receipt of information by the most rapid available means either to the next higher headquarters or directly to the agency immediately involved. It primarily concerns itself with friendly aircraft in distress, and unusual concentrations of enemy aircraft, troops, or shipping. The form of the report should include:

a. Who, What, When, Where.



b. Time, Place, Height.

c. Time of receipt and transmission.

d. Source of information.

e. Evaluation of information.

Flash Report

This report varies with the conditions and the unit reported on. In a fighter unit, headquarters is primarily concerned in this initial Flash Report with the number of aircraft lost, missing or returned. In a bomber unit they are interested primarily in the results of the mission, was the target hit, and which one? In either case, this first report or Flash Report is merely a rough estimate, subject to correction. Upon receipt at the unit originating the report, either by radio or from landed crews, it is sent immediately by the most rapid available means to the next higher headquarters.

Preliminary Report

This report is sent as soon as the general picture becomes clearer and a rough estimate of the results of the mission can be compiled from the interrogation. It is generally telephoned to the next higher headquarters within two hours after the aircraft have landed. For the sake of brevity in telephoning, it is usually SOP to simply give the name of the target, and then mention the paragraph number only, followed by the figure or descriptive word.

Final Mission Report

This report normally is sent to the next higher headquarters by teletype as soon as it is complete and accurate after interrogation reports are correlated. In no event should it be sent later than 1200 hours the day following the mission. This report should present a complete intelligence account of the mission unless a special report is called for or additional information is uncovered later, such as the Missing Aircraft Report. The final mission report is divided into two sections, Statistical and Narrative. By consolidating the information received at the time of the interrogation and by checking with the unit specialists who participate in the interrogation, it should be possible to forward the statistical part of the report within a short time. Effort can then be concentrated on the narrative part which can be forwarded later, separately.

Supplementary Reports

Supplementary or special reports that may be required are:

a. Missing Aircraft Report: It is the primary pur-

1346

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

pose of this report to determine how, where, when, and why our aircraft are lost to enemy action, so that facts will be learned from our losses which will reduce them in future operations. It is usually submitted in writing to the next higher headquarters with appropriate diagrams.

b. Combat Report: This report is a detailed one of encounters with enemy aircraft. It is used to secure accurate data as to losses inflicted on the enemy aircraft by our fire; to prove or disprove effectiveness of our fire; to secure information on enemy tactics; and to evaluate claims on enemy aircraft shot down or damaged.

c. Group Combat Report: This report is designed to prevent duplication of combat claims and is sent in after all combat reports have been evaluated and checked for duplication.

d. Enemy Tactics Report: This subject was considered of such importance in certain air forces that one intelligence officer in each group became a specialist in it. He was required to submit a weekly report to higher headquarters on enemy aircraft tactics covering the week's activities. Much of the information came from a study of the interrogation forms, but even more came from direct, informal talks with combat crews. Most combat crews have a vast accumulated store of information which does not come out at interrogation and which would never be put in writing unless such a report were written.

e. Shipping Report: This is a more complete and detailed report of such information as is included in the "Hot News" Report under enemy shipping.

f. Special reports prepared by officers other than intelligence officers include a Flak Report, a Photo and Bomb Plot Report, and a Mission Camera Report.

REPORT FORMS

Data covered in the preliminary and in the final mission reports after a bombing mission and initiated at group level are as follows:

Preliminary Report—(Name of Target)

a. Group.
b. A/C dispatched.
c. A/C failing to bomb.
d. A/C attacking.
e. A/C lost.
f. Bombing results (good, fair, poor, etc.).
g. Casualties (KIA, MIA, WIA).
h. Enemy air opposition (considerable, moderate, slight, nil).
i. Estimate of enemy aircraft (destroyed, probable damaged).
j. Flak (intense, moderate, meagre, nil).
k. Flash observations of outstanding importance.
l. Observed fighter support.
m. Battle damage.

Final Mission Report

a. Statistical Report.

1. Unit.
2. Time of take-off.
3. Time of return.
4. Number of aircraft dispatched.
5. Number of aircraft attacking primary target.
6. Number of aircraft attacking secondary target.
7. Number of aircraft attacking last resort target.
8. Number of aircraft attacking target of opportunity.
9. Number of aircraft failing to bomb target.
10. Number of aircraft lost to flak.
11. Number of aircraft lost to enemy aircraft.
12. Number of aircraft lost by accident.
13. Number of aircraft lost by reasons unknown.
14. Time of attack.
15. Altitude of attack.
16. Bomb disposition.
    (*a*) Bombs on target—number, size, type.
    (*b*) Bombs unaccounted for—number, size, type.
    (*c*) Bombs jettisoned—number, size, type.
    (*d*) Bombs brought back—number, size, type.
17. Personnel casualties.
    (*a*) Number killed.
    (*b*) Number seriously wounded.
    (*c*) Number slightly wounded.
    (*d*) Number missing.
18. Number enemy aircraft destroyed, probably destroyed, damaged.

b. Narrative Report.

1. Detailed description of fighter opposition giving times, places, intensity, tactics and unusual maneuvers.

1347

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

2. General description of flak encountered giving type, intensity and accuracy.

3. Details on missing aircraft, probable fate of crews, time, place, etc.

4. Information on aircraft seriously damaged or crashed on return.

5. Elaboration on such items as enemy troop activity, new construction, highway and railroad activity, smoke screens, camouflage and dummies, etc.

6. General results of bombing attack with any items of note as seen by crews such as explosions, fires, etc.

7. Comments of crews if of particular note.

8. Preliminary photo interpretation report.

9. Brief summary of mission covering time of take-off, whether or not briefed course was followed, position of group in flight and attack, heading on bomb run, second runs, etc. If any part of the report cannot be submitted at the proper time, the reason for the nonsubmission will be given, and the information will be furnished by teletype when it becomes available. Similar mission reports may be SOP for fighter units performing support missions for bombardment. For some fighter units a daily report may be SOP which will include all unit operations for the 24 hour period including sorties flown, results of enemy encounters, and summaries of enemy activities such as bombing or strafing attacks against the airdrome.

Questions and Leads for Classroom Discussion

1. What are the major factors governing the writing of reports?
2. What is the disposition of the various reports?
3. What is a preliminary report?
4. What should be presented by a final mission report?
5. What are supplementary reports?

EXAMPLE OF A BOMBARDMENT UNIT'S WIRED MISSION REPORT
Teletype, Telegraph, or Radio

a. Designation of unit.
b. Time of take-off.
c. Time of return.
d. Number of a/c taking off.
e. Number of a/c attacking primary target.
f. Number of a/c attacking secondary target.
g. Number of a/c attacking last resort target.
h. Number of a/c attacking target of opportunity.
i. Number of a/c which failed to bomb target.
j. Number of a/c lost to flak.
k. Number of a/c lost to e/a.
l. Number of a/c lost by accident.
m. Number of a/c lost by reasons unknown.
n. Time of attack.
o. Altitude of attack.
p. Bombs on each target (number, size, and type).
   (1) Bomb loadings, number, size, type.
   (2) Bombs unaccounted for, number, size, type.
q. Number of a/c jettisoning bombs (number, size, type of bombs).
r. Number of a/c bringing bombs back (number, size, type of bombs).
s. Personnel casualties (number killed, number seriously wounded, number slightly wounded, number missing).
t. Number e/a destroyed, probably destroyed, damaged. (See note below.)
u. Remarks.
   (1) General description of fighter opposition giving approximate number and types encountered and main types of attack.
   (2) General description of flak encountered giving where encountered, type, intensity, and accuracy.
   (3) Elaboration on information on a/c lost or in distress.
   (4) Information on a/c seriously damaged, or crashed on return.
   (5) Number of a/c sustaining category "A" and number sustaining category "AC," "B," or "E" battle damage.
   (6) Elaboration on observation of interest, previously noted in flash report (if necessary).
   (7) General results of the bombing attack. An elaboration of that previously given in flash report.
   (8) Crews' comments and suggestions, if of value.
   (9) A brief descriptive summary of the mission.

NOTE: If any part of the report cannot be submitted at the proper time, reasons for nonsubmission will be given, and the information will be furnished by teletype when it becomes available. When teletype or telegraph is not available and this report must be sent in code by radio, the sequence of items sent must be scrambled differently each time at random. To facilitate this scrambling each complete item should be copied down on the message blank in scrambled sequence.

In some theaters mission reports are required for each bombardment mission flown. Similar reports may be S.O.P. for fighter units performing support missions for bombardment. For some units a daily report may be S.O.P. which will include all unit operations for the 24-hour period including sorties flown and results of enemy encounters and summaries of enemy activities such as bombing attacks against the airdrome.

CHAPTER XXIV
MAPS AND DIAGRAMS

SCOPE

This Chapter assumes the intelligence officer's knowledge of the basic principles and practice of military mapping and map reading (as outlined in FM's 21-25, 21-26, 21-30 and 30-22), and discusses only special maps and diagrams whose preparation and maintenance are peculiar to intelligence. The more common types of graphic representations prepared by intelligence sections are:

a. Situation Map.
b. Theater Map.
c. Enemy Air Order of Battle.
d. Geographic Flak and Enemy Defense Map.
e. Flak Diagrams.
f. Bomb Impact Plots.
g. Track Charts.
  1. Air Combat.
  2. Proposed Route.
h. Target Charts and strips.

SITUATION MAPS

Situation maps portray enemy, friendly, or enemy and friendly, operations and positions at a specific time. In ground units, a map showing enemy positions is known as an *intelligence* situation map; showing friendly positions, it is known as an *operations* situation map. In air units a combined, or joint operations-intelligence, situation map is recommended because intelligence is required to have knowledge of both friendly and enemy situation. Usually information is posted on an overlay so that changes can be made quickly, and the map maintained constantly up to date.

The overlay should never be cluttered with material that will obscure the basic information, or with data already available on the underlying map.

Any transparent hard-surfaced material, such as tracing paper, tracing cloth, vellum, cellophane, plasticele, plexiglas or cellulose acetate can be used for an overlay. Depending on the surface of the over-

1361

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

lay material, markings can be made with colored inks. (Camera film with the emulsion washed off in warm water, with sodium carbonate added to aid in the removal, makes a satisfactory substitute for plasticele. The film should be so overlapped that grease pencil rubbings will not work through to the map surface.)

Where overlays are not used, postings may be made directly on the basic map; using cardboard, push-pins and flags as symbols. Some situation maps, particularly in anti-submarine units, are laid over an iron sheet and magnetized metal markers are placed at will on the surface.

To facilitate the measuring of distances, handy map scales made in the form of wooden rulers can be hung near the appropriate maps.

The usual information posted on a situation map is presented in the "shorthand" form of military symbols prescribed in FM 21-30. *Every item posted should be dated.*

THEATER MAPS

A theater map is a display or "current events" map. An effective theater map can be created by posting typed information around the border of the map which relates to events at specific points and connecting such data to the location by use of colored yarns or lines drawn with colored grease pencils. Aerial photographs, detail maps, statistical tables, news clippings, etc., are used to add interest to the display.

ENEMY AIR ORDER OF BATTLE

Enemy Air Order of Battle is most effectively presented on a map by use of push-pins to indicate enemy air units. Different shapes, colors and markings on pins can be used to distinguish type and strength of units represented. In advanced field conditions, data is best marked by grease pencil on an overlay.

FLAK AND ENEMY DEFENSE MAPS

Flak and enemy defense maps show the location and type of anti-aircraft weapons, searchlights, balloon barrages, etc. Locations may be indicated with pins, flags, or markings on an overlay or on the map itself.

A geographic flak map shows by means of circles and variety of colors the enemy anti-aircraft defenses of an area, indicating location, type, density and ranges of guns.

FLAK DIAGRAMS

While a flak map shows the location of enemy anti-aircraft guns, a flak diagram is a representation of the volume of probable fire at a given altitude over a specified target. Density of fire is often illustrated by the use of light-colored circular discs to show the field of fire. These can be printed on a chart, or made of translucent plastic material and hung on pins which indicate gun positions. The varying density of color, resulting from the overlapping of the discs, is a gauge of the intensity of the fire. The more accurate clock density charts showing the number of units of fire to be expected along the different radii or headings from a target can be used to show the paths in and out which are most free of flak.

COMPOSITE MAPS

At times, especially when the unit is moving rapidly, a single map presenting all information may be preferable.

BOMB IMPACT PLOTS

A bomb impact plot is an annotated print which shows the location of each bomb impact in the target area. These plots are made by using every photograph taken by the attacking aircraft during any one mission. With the aid of a stereoscope all bursts visible on the photograph are plotted on the bomb impact overlay or photograph. A report stating what areas or buildings appear to have been hit always accompanies the Bomb Impact Plot.

TRACK CHARTS

There are two types of track charts: Air combat and route. Track charts of air combat locate attacks by enemy aircraft and anti-aircraft artillery on the track made by our aircraft. Track charts of routes show the routes proposed for each mission and those actually flown by each aircraft or group of aircraft. Information necessary for the preparation of both these charts is obtained through interrogation, navigators' logs and photographs of enemy aircraft.

TARGET CHARTS AND STRIPS

Target charts and strips are described in Chapter XVIII. Usually they are available to intelligence from higher echelons; if not, intelligence can prepare substitutes by drawing concentric circles at one-mile intervals on a map of the target area.

Questions and Leads for Classroom Discussion

1. What is a situation map?
2. What is a theater map?
3. Discuss flak and enemy defense maps.
4. What is a bomb impact plot?
5. What are target charts and strips?

Hq. 2nd Air Defense Div.
Detroit, Michigan
22 Nov 19__1100

AIR INTELLIGENCE ESTIMATE

MAPS: Special Map A: Scale 1:500,000.

1. MISSION.

To provide air defense for factories "A", "B", and "C", in the DETROIT area effective 25 Nov____.

2. ENEMY SITUATION.

a. General

(1) Enemy Air Forces:

(a) Land Based (SNOW ISLAND area)

Long Range Bombers, VLRB 230 Sky Fort - 576
Long Range Fighters, LRF PX 333 Silver Fox - 240
Long Range Rcn, LRP PX 33F Grey Fox - 40
Troop Carriers, CU 101, Red Fox - 144
Percent of aircraft normally maintained as operational are:

Bombers - - - - - - - - - - - - - -60%
Fighters - - - - - - - - - - - - - -75%
Rcns - - - - - - - - - - - - - - - -75%
Transports - - - - - - - - - - - - -60%

ALL AGGRESSOR bombers are equipped with radar bombing devices in addition to visual type bomb sights. For radius of action of enemy aircraft, see Order of Battle Report, dated 15 Nov. _____.

(2) Enemy Ground Forces: (SNOW ISLAND area)

(a) 81st and 91st Airborne Divisions (10,000 troops each)

(b) 101st Mechanized Division (6600 troops)

(3) Enemy Naval Forces: AGGRESSOR'S North Atlantic Fleet has withdrawn to home bases in the face of superior BLUE naval forces. AGGRESSOR submarines are known to be operating in the North Atlantic area on resupply missions. These submarines are reported to be transporting early warning radar equipment, and technical personnel needed on Snow Island.

b. Special

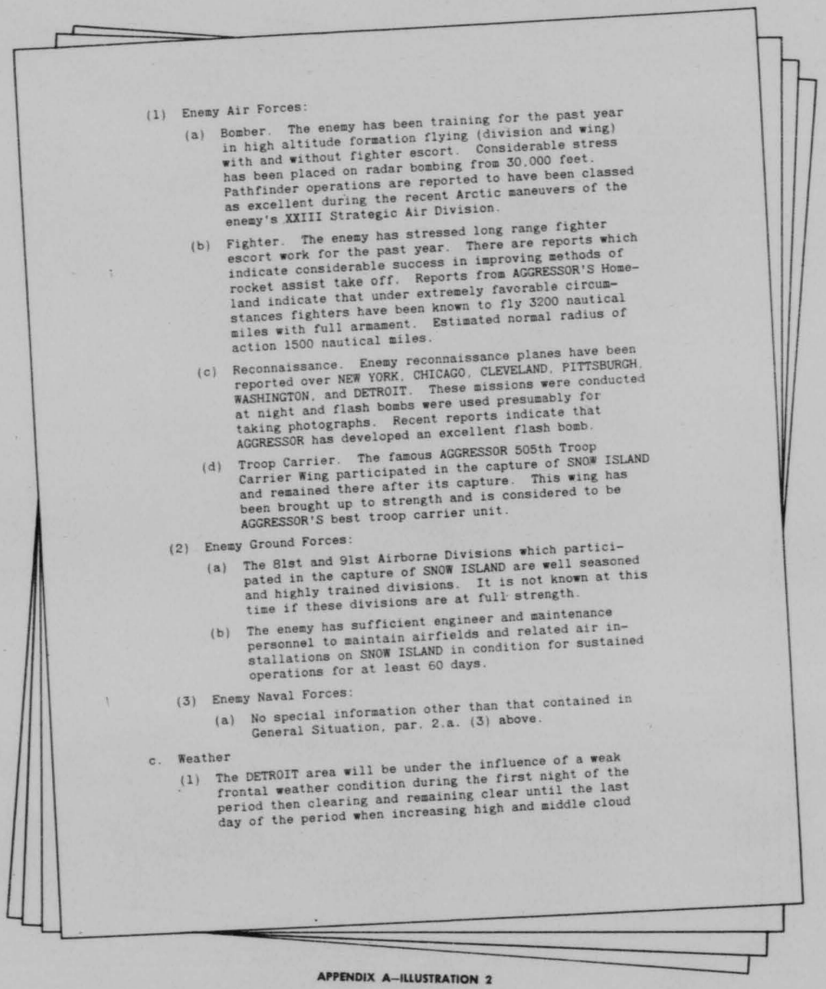
APPENDIX A—ILLUSTRATION 1

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED



(1) Enemy Air Forces:

(a) Bomber. The enemy has been training for the past year in high altitude formation flying (division and wing) with and without fighter escort. Considerable stress has been placed on radar bombing from 30,000 feet. Pathfinder operations are reported to have been classed as excellent during the recent Arctic maneuvers of the enemy's XXIII Strategic Air Division.

(b) Fighter. The enemy has stressed long range fighter escort work for the past year. There are reports which indicate considerable success in improving methods of rocket assist take off. Reports from AGGRESSOR'S Homeland indicate that under extremely favorable circumstances fighters have been known to fly 3200 nautical miles with full armament. Estimated normal radius of action 1500 nautical miles.

(c) Reconnaissance. Enemy reconnaissance planes have been reported over NEW YORK, CHICAGO, CLEVELAND, PITTSBURGH, WASHINGTON, and DETROIT. These missions were conducted at night and flash bombs were used presumably for taking photographs. Recent reports indicate that AGGRESSOR has developed an excellent flash bomb.

(d) Troop Carrier. The famous AGGRESSOR 505th Troop Carrier Wing participated in the capture of SNOW ISLAND and remained there after its capture. This wing has been brought up to strength and is considered to be AGGRESSOR'S best troop carrier unit.

(2) Enemy Ground Forces:

(a) The 81st and 91st Airborne Divisions which participated in the capture of SNOW ISLAND are well seasoned and highly trained divisions. It is not known at this time if these divisions are at full strength.

(b) The enemy has sufficient engineer and maintenance personnel to maintain airfields and related air installations on SNOW ISLAND in condition for sustained operations for at least 60 days.

(3) Enemy Naval Forces:

(a) No special information other than that contained in General Situation, par. 2.a. (3) above.

c. Weather

(1) The DETROIT area will be under the influence of a weak frontal weather condition during the first night of the period then clearing and remaining clear until the last day of the period when increasing high and middle cloud

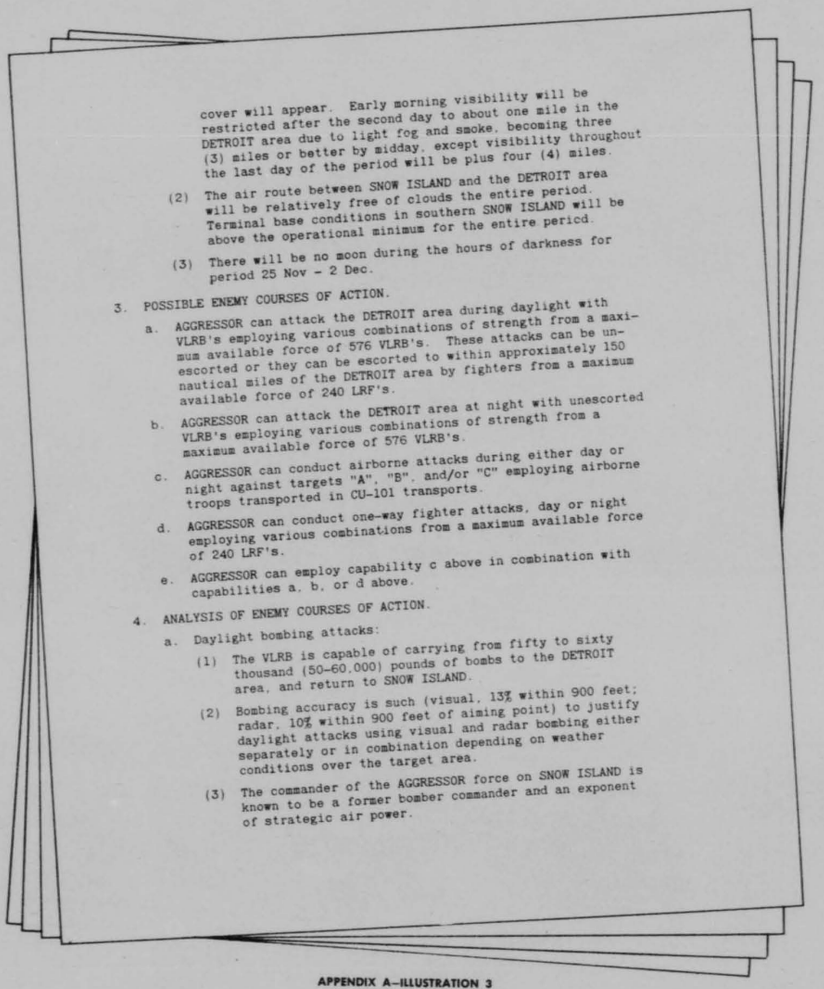
APPENDIX A—ILLUSTRATION 2

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED



cover will appear. Early morning visibility will be restricted after the second day to about one mile in the DETROIT area due to light fog and smoke, becoming three (3) miles or better by midday, except visibility throughout the last day of the period will be plus four (4) miles.

(2) The air route between SNOW ISLAND and the DETROIT area will be relatively free of clouds the entire period. Terminal base conditions in southern SNOW ISLAND will be above the operational minimum for the entire period.

(3) There will be no moon during the hours of darkness for period 25 Nov - 2 Dec.

3. POSSIBLE ENEMY COURSES OF ACTION.

a. AGGRESSOR can attack the DETROIT area during daylight with VLRB's employing various combinations of strength from a maximum available force of 576 VLRB's. These attacks can be unescorted or they can be escorted to within approximately 150 nautical miles of the DETROIT area by fighters from a maximum available force of 240 LRF's.

b. AGGRESSOR can attack the DETROIT area at night with unescorted VLRB's employing various combinations of strength from a maximum available force of 576 VLRB's.

c. AGGRESSOR can conduct airborne attacks during either day or night against targets "A", "B", and/or "C" employing airborne troops transported in CU-101 transports.

d. AGGRESSOR can conduct one-way fighter attacks, day or night employing various combinations from a maximum available force of 240 LRF's.

e. AGGRESSOR can employ capability c above in combination with capabilities a, b, or d above.

4. ANALYSIS OF ENEMY COURSES OF ACTION.

a. Daylight bombing attacks:

(1) The VLRB is capable of carrying from fifty to sixty thousand (50-60,000) pounds of bombs to the DETROIT area, and return to SNOW ISLAND.

(2) Bombing accuracy is such (visual, 13% within 900 feet; radar, 10% within 900 feet of aiming point) to justify daylight attacks using visual and radar bombing either separately or in combination depending on weather conditions over the target area.

(3) The commander of the AGGRESSOR force on SNOW ISLAND is known to be a former bomber commander and an exponent of strategic air power.

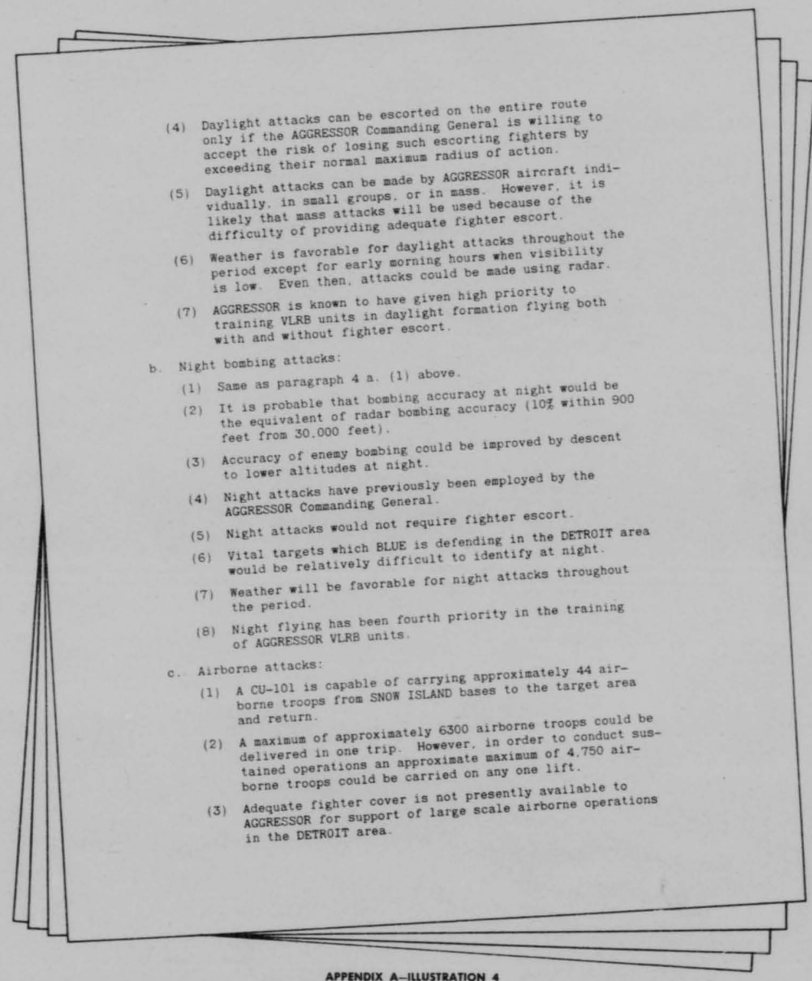
APPENDIX A—ILLUSTRATION 3

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED



(4) Daylight attacks can be escorted on the entire route only if the AGGRESSOR Commanding General is willing to accept the risk of losing such escorting fighters by exceeding their normal maximum radius of action.

(5) Daylight attacks can be made by AGGRESSOR aircraft individually, in small groups, or in mass. However, it is likely that mass attacks will be used because of the difficulty of providing adequate fighter escort.

(6) Weather is favorable for daylight attacks throughout the period except for early morning hours when visibility is low. Even then, attacks could be made using radar.

(7) AGGRESSOR is known to have given high priority to training VLRB units in daylight formation flying both with and without fighter escort.

b. Night bombing attacks:

(1) Same as paragraph 4 a. (1) above.

(2) It is probable that bombing accuracy at night would be the equivalent of radar bombing accuracy (10% within 900 feet from 30,000 feet).

(3) Accuracy of enemy bombing could be improved by descent to lower altitudes at night.

(4) Night attacks have previously been employed by the AGGRESSOR Commanding General.

(5) Night attacks would not require fighter escort.

(6) Vital targets which BLUE is defending in the DETROIT area would be relatively difficult to identify at night.

(7) Weather will be favorable for night attacks throughout the period.

(8) Night flying has been fourth priority in the training of AGGRESSOR VLRB units.

c. Airborne attacks:

(1) A CU-101 is capable of carrying approximately 44 airborne troops from SNOW ISLAND bases to the target area and return.

(2) A maximum of approximately 6300 airborne troops could be delivered in one trip. However, in order to conduct sustained operations an approximate maximum of 4,750 airborne troops could be carried on any one lift.

(3) Adequate fighter cover is not presently available to AGGRESSOR for support of large scale airborne operations in the DETROIT area.

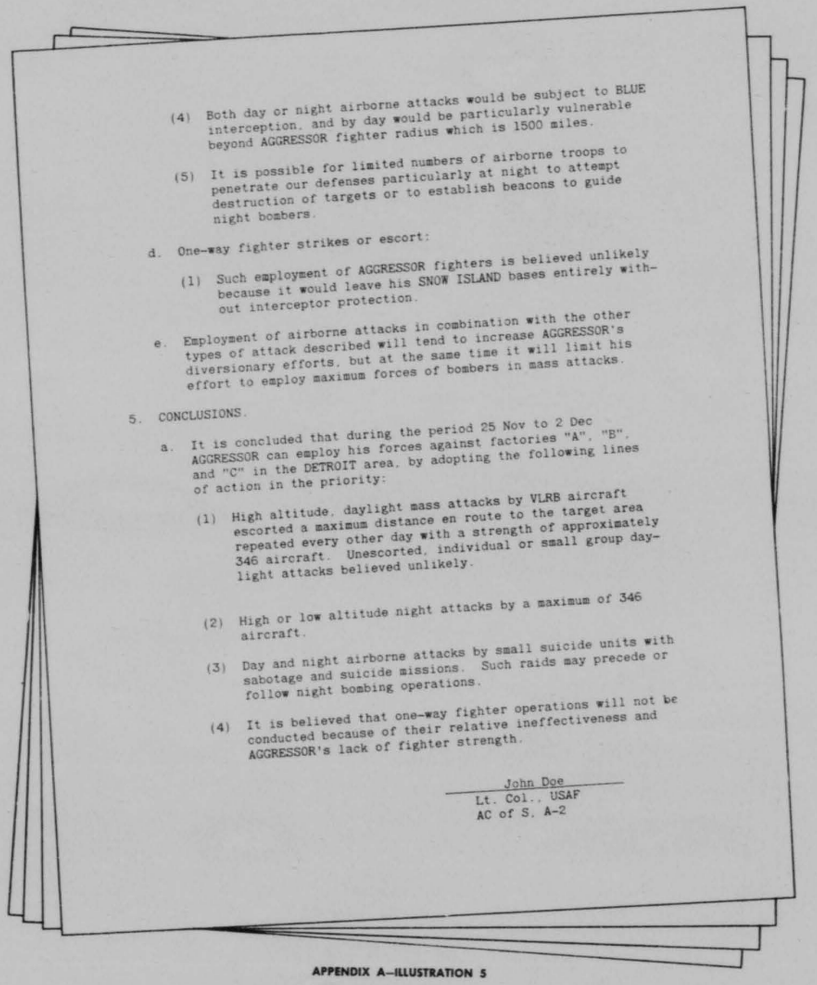
APPENDIX A—ILLUSTRATION 4

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED



(4) Both day or night airborne attacks would be subject to BLUE interception, and by day would be particularly vulnerable beyond AGGRESSOR fighter radius which is 1500 miles.

(5) It is possible for limited numbers of airborne troops to penetrate our defenses particularly at night to attempt destruction of targets or to establish beacons to guide night bombers.

d. One-way fighter strikes or escort:

(1) Such employment of AGGRESSOR fighters is believed unlikely because it would leave his SNOW ISLAND bases entirely without interceptor protection.

e. Employment of airborne attacks in combination with the other types of attack described will tend to increase AGGRESSOR's diversionary efforts, but at the same time it will limit his effort to employ maximum forces of bombers in mass attacks.

5. CONCLUSIONS.

a. It is concluded that during the period 25 Nov to 2 Dec AGGRESSOR can employ his forces against factories "A", "B", and "C" in the DETROIT area, by adopting the following lines of action in the priority:

(1) High altitude, daylight mass attacks by VLRB aircraft escorted a maximum distance en route to the target area repeated every other day with a strength of approximately 346 aircraft. Unescorted, individual or small group daylight attacks believed unlikely.

(2) High or low altitude night attacks by a maximum of 346 aircraft.

(3) Day and night airborne attacks by small suicide units with sabotage and suicide missions. Such raids may precede or follow night bombing operations.

(4) It is believed that one-way fighter operations will not be conducted because of their relative ineffectiveness and AGGRESSOR's lack of fighter strength.

John Doe
Lt. Col., USAF
AC of S, A-2

AIR INTELLIGENCE Review

This "Review" is published for three reasons:
1. To provide timely data regarding new techniques, practices and general information whereby intelligence personnel can maintain proficiency.
2. To provide material which will afford all personnel an appreciation of the intelligence role.
3. To provide a medium whereby all intelligence personnel and activities may exchange viewpoints, problems and solutions.

Two types of material are solicited for publication:
1. Stories and pictures relating to the intelligence activities being conducted within an organization.
2. Original articles of a noncontroversial but informative nature.

Material submitted must include sources utilized and the authors name, rank and present military affiliation. Mail stories to: The Editor, "Air Intelligence Review," ConAC, Mitchel Air Force Base, New York.

WARNING— THIS DOCUMENT CONTAINS INFORMATION AFFECTING THE NATIONAL DEFENSE OF THE UNITED STATES WITHIN THE MEANING OF THE ESPIONAGE LAWS, TITLE 18 U.S.C., SECTIONS 793 AND 794. DECLASSIFIED
EO 11652

This issue of the Air Intelligence Review has been especially prepared to *FAMILIARIZE* Reserve as well as Regular members of the Air Force with the operational characteristics of current USAF aircraft and their immediate experimental successors.

In addition to a brief history of the USAF, the text recounts the progress that has been made by aircraft designers in overcoming material, structural and aerodynamic obstacles since 1903. The glossary contained in the last four pages of the Review is provided to acquaint the reader with commonly used AF terminology.

It will be noted that in certain cases operational figures have been approximated and in others, left out entirely. Such approximations and omissions were made necessary for obvious security reasons. It may be expected, however, that as the production stage of presently classified equipment is reached, the operational performance data will be generally released.

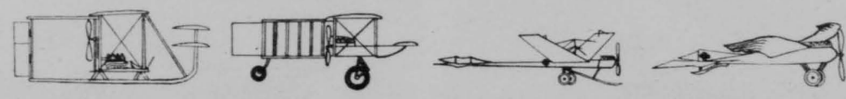
U S A F MOVES FORWARD

At approximately half past ten o'-clock on the morning of December 17, 1903, Orville Wright piloted the famous Wright powered biplane a distance of a little over 120 feet in 12 seconds, at a maximum altitude of 10 feet and at a speed of slightly over 31 miles per hour. That flight, which has gone down in history as man's first successful attempt to stay aloft in a heavier-than-air craft, was one of the four flights made that historic morning at Kitty Hawk, N. C., the longest of which was a distance of 852 feet in 59 seconds. During the 5 years following the first flight, no fundamental changes were made in the original airplane, which controlled lateral stability by warping the after portion of the wing tip section in such a way as to vary the camber of the tips.

Until the outbreak of World War I, aircraft design and construction had very little scientific or engineering data to use as a basis. Stresses in flight were largely unknown and the aerodynamics of balance and control were only vaguely understood. The theory of stability was quite unappreciated and wing sections in use were inefficient. Great strides, however, were made in experimentation. Important patents were taken out. The industrial field was scoured for suitable materials, and familiar structural principles were gradually applied to this new field. In this early period the records of failure and of achievement in aeronautical activity served as the backbone of the science rather than the supporting theory, which later was quickly built up as a result of wind tunnel investigations, flight tests, and application of physical laws.

The academic interest evinced by scientists in aeronautical problems was supplemented by energetic application shortly after the outbreak of World War I. The employment of airplanes in warfare made accessible resources that private interests, stimulated by pioneering enthusiasm or the hope of ultimate financial profit, could never have effected.



1903 1908 1910 1914

In 1917, the AAF, then known as the Aviation Section, S.C., consisted of only about 65 officers actually detailed for duty and a little more than 1,000 enlisted men. The plane strength was 55, but, these were all of the training type, and were totally unsuited for combat work. No flying officer had had actual combat experience, and practically none had any knowledge of aircraft guns or bombing devices.

American industry went to work to build an air force. Up to 1916, the aircraft industry had delivered a total of 142 aircraft to the Army, in the ten years of the existence of Army aeronautics. Now it was called upon to produce over 22,000 planes in a single year. Congress appropriated $640,667,000 to build these planes and to train the flyers to

RESTRICTED

1386

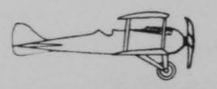
THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

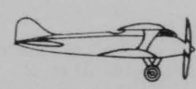
pilot them.

The war lasted only a few months insofar as the Aviation Section was concerned, but in those months America's air arm proved its combat worth. American pilots flew nearly 36,000 hours behind enemy lines, or approximately 3,600,000 miles; they made about 13,000 pursuit flights, 6,600 observation flights and 1,100 bombing missions. Despite inexperience, and, at first inferior equipment, American airplane losses were less than half that of the confirmed enemy loss - the Air Service losing 357 as against 755 for the enemy.

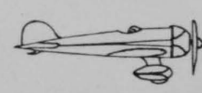
In the final months of the war, the Air Service, as it was redesignated during this period, bombed the enemy at every stage of his retreat, striking at railroad centers, troop concentrations and communications. In 150 organized missions, 255,000 lbs of explosives were dropped.



1920



1923



1934

19—

Peak strength of personnel reached over 195,000 in 1918, while a total of 13,901 planes were produced from April 6, 1917 until the end of the war; 5,151 more were bought in Europe.

The war had proved that the Air Service had a definite place in army operations, and, in 1920, Congress passed an Army reorganization act which raised the air arm to branch level and gave it an authorized strength of 1,516 officers and 16,000 enlisted men.

The "Twenties" were years of readjustment and experimentation for the Air Service. Research was conducted into the possibilities of lighter-than-air craft but later abandoned. The de Havillands and Curtiss "Jennies", which had been the war-time mainstay, lasted well into the latter part of the decade, but were gradually replaced by new planes.

The designation Air Service was eliminated on July 2, 1926, when an act of Congress created the Air Corps, with General Mason M. Patrick continuing as Chief.

Randolph Field, "West Point of the Air", was dedicated on June 20, 1930, as the home for future AAF training.

The early thirties produced two important developments in aircraft design. One was the new mono-plane design, the other the growing use of all-metal construction. In 1931 Boeing brought out the Air Corps' first all-metal bomber, the B-9, a mid-wing mono-plane with retractable landing gear. The same year, the Curtiss Company introduced the first all-metal attack mono-plane, the A-8. Throughout the thirties new and improved aircraft continued to appear.

It was natural that in the ensuing 23 years the AAF would undergo considerable expansion, since aviation itself was growing up. But a comparison of statistics between World Wars I and II reveals that the AAF grew out of all proportion.

In World War II, the AAF flew 13,500,000 hours in overseas theaters, making more than 2,362,000 combat sorties, and dropping over 2,000,000

RESTRICTED

1387

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

tons of bombs. Although the AAF lost 11,687 planes on combat missions, it also destroyed 40,259. Peak/ personnel strength was 2,411,294 in March 1944, while plane strength reached 79,908 in July 1944.

The achievements of any single air force in WW II dwarf the total air effort of the first world conflict. Taking the Twentieth Air Force as an example, since it was neither the largest nor the smallest of the air forces, the tremendous strides in air power become evident. The Twentieth alone flew 35,790 effective sorties, almost twice that of the entire Air Service in World War I. The Twentieth alone dropped more than 170,000 tons of bombs and lost three less planes than the Air Service in World War I, while destroying 1,225, more than half again the World War I total.

AIRCRAFT DESIGN

A successful airplane will be at best a compromise, owing to conflicting requirements. Thus, an airplane designed for ease of overhaul must offer parasite resistance greater than that occurring where this feature is neglected. Again visibility must be sacrificed for aerodynamic efficiency. On the whole then, the successful airplane must meet the requirements which are listed below in the order of their relative importance:

a. The design must be such that the airplane will best perform the functions for which it is built.

b. Repair and maintenance in the field must require a minimum of time and expense.

c. The airplane must be built as cheaply and simply as possible consistent with other requirements.

d. The airplane must be aerodynamically efficient or must have a maximum of speed and climbing ability with a minimum of power.

Vital Characteristics: The designer of an airplane, having available an engine of given power to carry a specified weight, does his best to embody the following characteristics in the completed airplane:

a. Lowest feasible landing speed for a given area of wings.

b. Greatest possible high speed.

c. Best possible maneuverability.

d. Best rate of climb.

e. Desirable amount of stability.

f. Maximum visibility.

g. Minimum structural weight for adequate strength.

h. Minimum profile resistance.

i. Lowest cost.

The first four characteristics mentioned hinge primarily on the selection of the airfoil or airfoil combinations. Stability and visibility depend largely on the arrangement of the structure or lay-out. The remaining characteristics are associated with the selection and fabrication of structural materials.

Structural qualities — In addition to the characteristics vital to performance, there are certain structural qualities essential to successful operation. These are —

a. Sufficient rigidity to prevent vibration and distortion.

b. Enough flexibility to absorb

1388

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

and distribute sudden shocks and uneven strains.

c. Fabricated parts of type such as to show definite signs of deterioration prior to absolute failure.

d. Material of high strength ---- weight factor to insure lightness.

e. Material which is homogeneous, resistant to fatigue, shock, stress reversal, etc.

f. Maximum resistance to deterioration due to corrosion,decay, etc.

g. Structure readily accessible for inspection and repair and also designed for ease of overhaul of power plant and equipment.

Of the aircraft classified as heavier-than-air, the airplane is most common, most successful and the most highly developed type of flying machine. It is supported by dynamic forces caused by air being passed over its wings. The relative motion of the air is effected by having the craft forced through the air by an engine-propeller unit.

HIGH SPEED FLIGHT

Since the first flight by the Wright brothers the progress of aviation has exceeded all other modes of transportation. This progress is tempered by the sobering fact that the record speeds of inhabited aircraft have progressed at the rate of only about 15 miles per hour per year. (This does not consider the speeds obtained by the XS-1.)

It is proper to predict equally good or better future progress in aviation but it must be pointed out that development problems are becoming increasingly greater. Because of the high cost involved, future development will be to some degree proportional to the financial appropriations made available.

Comparing the progress of aviation with other speed record histories, the airplane is far ahead. The official airplane record was established by an F-86 at 710 miles per hour. The automobile has a record set up in 1939 of 390 miles per hour and the railroad's speed record in 1943 was 135 miles per hour.

To give you an idea of the problem of power requirements in increasing the speeds of airplanes it would require at least eight times the thrust horsepower to increase the speed of an airplane from 500 mph to 1,000 mph.

Discussions of present day flying require frequent reference to the speed of sound and the mach number. These references are very important to present day flight studies of compressibility effects, which are perhaps among our greatest problems, and bear a direct relationship to the speed of sound. The speed of sound varies with temperature and consequently with altitude; i.e.; between 761 mph at sea level and 633 mph at 35,000 feet. It is constant above that point to about 150,000 feet. For example a compressibility characteristic that may occur at a mach number of .9 or approximately 685 mph at sea level, will also occur very much the same at a mach number of .9 at a 35,000 foot altitude, but at that altitude has a true speed of only approximtely 595 mph.

Contrary to common belief, the speed of sound in air is proportional to temperature variations only, not density (altitude).

As aircraft that are built for the Air Force must fly high and fast, they must be built to withstand high temperature, low temperature, shock

1389

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

loads and high G-forces. These cause many problems of design.

The airplane must be designed to avoid the effects of compressibility, be able to give the pilot comfort at high altitudes and still have fighting equipment aboard. Airfoils are now thin. The engines use terrific amounts of fuel. The fuselage is full of miscellaneous equipment and still the airplane must be able to take off and land in a reasonable area.

FACTORS AFFECTING AIRCRAFT PERFORMANCE AND NEW AIRCRAFT

From a conclusion on the part of an individual or individuals concerned that a particular type aircraft is desirable, action can take two general forms.

a. Setting forth in writing a set of very broad requirements.

b. Submit a rigid specification prepared by an outside body and giving little overall freedom of design.

This rigid outline seldom results in the most satisfactory design to do the job because too many things are required of the aircraft at the same time.

Aircraft can be classified by general functional fields as:

a. Offensive and defensive weapons.

b. Transport.

c. Liaison.

d. Training

From a military point of view, the final aircraft will be judged upon the extent to which it excels in the following design considerations:

MILITARY SUITABILITY is constituted in the ability of the aircraft to perform the mission for which it was primarily designed. It is the dominating consideration in the design of the aircraft and encompasses the ability of the aircraft to perform and successfully accomplish a specific task. It usually comprises such factors as range, maneuverability, speed, stability, take-off and landing characteristics, rate of climb, dependability, comfort and useful load and equilibrium as an armament platform.

TACTICAL VERSATILITY is the ability of the aircraft to perform missions other than that for which it was primarily designed. This involves adapability to the installation of auxilliary fuel provisions, armament, and the flexibility of its interior arrangement to accomodate different categories of useful load. The fluctuating demands of warfare require that missions be flown under circumstances not anticipated in formulating plans under theoretical conditions.

RAPIDITY OF PRODUCTION, (Producability). Design for rapid production is essential and an obligation of aircraft designers. Simple designs with few complicated structures and parts are most rapidly and economically fabricated. During periods of national emergency, designs involving extremely complex mechanisms and processes requiring long manufacturing cycles and utilizing scarce materials, must be sacrificed in favor of simpler designs in order to allow maximum usage of existing facilities, labor and materials.

CLIMATIC VERSATILITY. The existance of extreme temperatures and

1390

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

atmospheric humidity and their related phenomena must be acknowledged and the design must effectively prevent an inordinate reduction in operability. Factors such as ice accretion, differential contraction and expansion, improper lubrication, and the development of corrosion and fungi, may cause the aircraft to be unserviceable without prohibitive maintenance measures.

EASE OF MAINTENANCE. The objective from the standpoint of field service is to maintain the maximum number of aircraft operational with a minimum expenditure of maintenance facilities and crews. In order to achieve this goal, definite consideration must be attributed in the fundamental design towards producing a practical and serviceable aircraft.

HUMAN FACTORS. A consideration of increasing importance in aircraft design, where the aircraft is inhabited by a human crew, is the relation of human capabilities and limitations to the unnatural environment of flight.

SAFETY AND DEPENDABILITY. This characteristic determines to a large degree the efficiency of the aircraft as suitable equipment for sound military operation. Confidence in the superiority and dependability of his weapon inspires the individual soldier, and thus contributes heavily to the most efficient performance of the combined military establishment.

This intangible quality determines absolutely the success or failure of any aircraft and cannot be emphasized too strongly. The safety and dependability of an aircraft will be judged by the factors of power plant reliability, structural integrity, emergency escape provisions, flight path controllability, and landing and take-off characteristics.

The preparation of this initial design is the kernel of the whole success of the project. The decisions to be made include such matters as aeroplane shape, wing loading and high lift devices, the choice of a power plant and a final estimation of the all up weight.

The military man, who is to use the fighter aircraft, has used similar weapons before and has valuable experience. This person is in a position to know what performance qualities he thinks are desirable and necessary. If he can define and classify these flying qualities in order of importance to the mission and in quantitative terms, he has the criteria for a successful design.

The great problem of designing for military aircraft with fighter type performance is to define what is really wanted in terms of maneuverability. Here is where the tactical man must decide on what factors he needs in maneuverability. He must then arrange them in order of their importance to the job to be done, such as: G load, rate of climb, radius of turn, rate of turn, rate of roll, ceiling, range, rate of acceleration or deceleration, maximum speed, and other qualities he may need.

From a design standpoint the above factors are greatly influenced by altitude and in order to meet the various requirements with satisfaction, due consideration must be given to the altitude at which these aircraft are to perform best.

The more understanding the tactical man can have of the fundamental general relationships involved in aircraft design, the more able he is to cooperate to the fullest in conveying

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

his ideas into the design requirements.

The extreme requirements of military aircraft, i.e., speed, range, altitude, rate of climb, etc. necessitate that the scope and realm of operation be broken into smaller regions, in order to allow for optimum performance. The future will, undoubtedly, see specialization of design and purpose to a much greater degree than before.

In commencing a design for the Air Force, a designer would take perhaps as a first step, the study of the requirements of that type as outlined by the written desired characteristics in order to be familiar with the order of importance of each characteristic.

Next, with the time and resources element in mind,he would investigate the new developments in aeronautics and incorporate in the new design any and all improvements and innovations which qualify as practical under the above considerations. This, of course, involves an estimation of the development time required on any new untried component.

A study should be made of existing aircraft having one or more similar performance characteristics to the ones desired. This will establish the degree and field of development which must be concentrated on in order to achieve these qualities in the same airplane.

If development time is not available then the degree of compromise must be determined.

As a result of the above steps the design is assembled and a mock-up is built to assure that everything will fit. Wind tunnel tests and/or free flight tests are run on models to check initial design. Eventually the prototype is built and flown. From this point on, the detail and production design stage is in full swing.

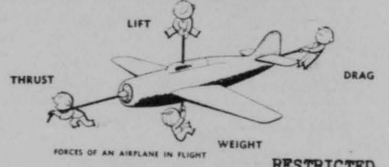
NEW AIRCRAFT DESIGN

In the past we have been satisfied with comparative slow speeds, but we found in the last war that often our enemies were able to travel faster in the air than we were. A good example of this is the German Heinkel fighter powered by a 2,400 pound thrust turbo jet on which was superimposed a liquid fueled rocket capable of delivering 2,700 lbs thrust for two (2) minutes. With this aircraft they were able to cut through our slower bomber formations and out distance our fighters. Then came the Guided Missile, the V-1 and the V-2 traveling at high speeds,powered by pulse jet and rocket engines respectively.

One can easily conclude from these facts that we must attain high speeds if we are to keep abreast or ahead of our potential enemies. To do this, our aircraft must be redesigned to withstand the effects of high speeds and altitudes, and our propulsive methods have to be improved in such a way as to make available much more thrust.

AERODYNAMICS PHASE

FORCES IN SUBSONIC FLOW. Of the four forces acting on an airplane in flight —— lift, weight, drag, and thrust — lift and drag are our primary concern as aerodynamic forces.



FORCES OF AN AIRPLANE IN FLIGHT

RESTRICTED

1392

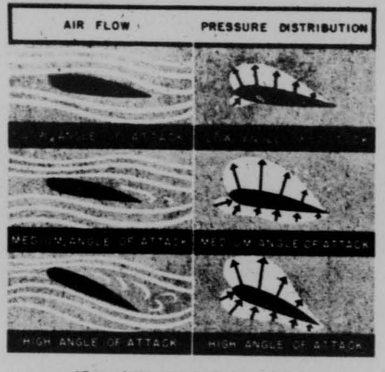
THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

The method by which lift is obtained is broken into two parts,both of which concern change in pressure. The first part is the negative pressure on the top of the wing. When there is an increase in velocity over the top of the airfoil due to the shape of the airfoil there must be a corresponding decrease in pressure or a negative pressure. This negative pressure area on the top contributes about 70% of the total lift at subsonic speeds. On the bottom of the wing there is a high pressure area, (with respect to the surrounding air). This is caused by the angle of attack of the wing.



Effects of Changing the Angle of Attack.

Air strikes the bottom of the wing and is deflected down. This force is transmitted through the surrounding air and causes the high pressure area. This gives us approximately 30% of the lift. The high pressure area seeks the low pressure area and there is a force exerted to give lift.

The drag of an airfoil is also broken into two parts - induced drag and profile drag. Induced drag is caused by the high pressure area tending to flow around the wing tips to the low pressure area on the top of the wing. This gives us turbulent flow patterns which we call trailing vortices. Induced drag may be minimized by elliptical lift distribution over the wing and a high aspect ratio.

Profile drag includes the drag due to the shape of the body (form drag) and due to the friction of air (parasite drag). For example, a cylinder would have more form drag than a flat plate parallel to the air stream. The parasite drag is caused by the friction between air molecules. The thin layer of air adjacent to the wing is stationary, whereas the free stream velocity over the wing may be three hundred miles per hour. The friction between succeeding air layers moving at increasing velocities gives us parasite drag. Actually the transition from Zero velocity immediately adjacent to the wing to free stream velocity is accomplished in a thickness of a fraction of an inch. This is called the boundary layer effect.

SPEED RANGES OF AIR FLOW. There are three speeds of flow: Subsonic, transonic, and supersonic. In subsonic flow all velocities of flow over our airfoil are less than the speed of sound. In transonic flow some velocities are above and some are below the speed of sound. In supersonic flow all velocities over the airfoil are above the speed of sound. The speed of flow is generally expressed as a mach number which is the ratio of the speed of flow to the speed of sound for the particular temperature in which the flow is measured.

THEORY OF TRANSONIC FLOW. In transonic flow, part of the airflow over the airfoil section is subsonic and part is supersonic,consequently, there must be a transition from sub-

1395

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

sonic to supersonic. This transition takes place instantaneously through a shock wave, which gives additional drag and also destroys some of the lift of the wing due to the increase in pressure.

Since present knowledge is very limited and due to the unpredictable changes in lift, drag, and movement of center of pressure, this transonic range is causing the most trouble today both in actual flight and in design.

THEORY OF SUPERSONIC FLOW. In supersonic flow the air flow over the wing is completely supersonic, so that there is now an orderly and predictable flow. The shock waves have moved forward to the leading edge and back to the trailing edge and contribute less drag and interference. However, there is a major change in the method of obtaining lift. The airfoil shape no longer gives a negative pressure area on the top of the airfoil. The lift contributed by change in angle of attack resulting in a high pressure area on the bottom of the airfoil in subsonic flow now constitutes 100% of the lift in supersonic flow, rather than 30%.

FUTURE TRENDS OF AIRFOILS AND WING PLANFORMS. In subsonic airfoils, smooth streamlining is necessary to prevent turbulence and separation.

Subsonic Airfoil

Trans-Supersonic Airfoil

In supersonic flow, sharp edges and thin airfoils are desirable to reduce the drag due to the airfoil shape and shock waves. Therefore, the trend for higher speeds will be towards thinner, stronger airfoils with sharp rather than blunt edges.

It has also been determined that sweptback or sweptforward wings are very effective in delaying the formation of shock waves in the transonic speed range and hence give higher subsonic speeds.

AIRCRAFT STRUCTURES PHASE

NEED FOR NEW AIRCRAFT STRUCTURES.. Since it is necessary to change airfoil design for high speeds, it follows that our structures in aircraft must change to incorporate these aerodynamic requirements for increased strength, decreased drag and possibly decreased weight or better weight control.

EFFECTS OF HIGH SPEEDS AND ALTITUDES ON AIRCRAFT STRUCTURES. It is a fact that if we were to fly 800 mph at sea level on an average day without some form of refrigeration the aircraft skin temperature, due to aerodynamic friction, would exceed the temperature limitations of all structural and equipment design specifications. This results in a need for further development of structures and materials to overcome this temperature obstacle. Two possibilities are to fly at higher altitudes to decrease this critical temperature situation or to refrigerate the aircraft. If we go to higher altitudes to reduce the effects of aerodynamic friction, but not so high as to encounter solar radiation troubles, we meet the problems of low atmospheric pressure and lack of oxygen.

At 21,000 feet there is insufficient oxygen to support combustion of a candle flame, at 32,000 feet gasoline boils if unpressurized (-65°F).

1394

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

At 63,000 feet blood will boil unless pressurized (body temperature 98.6°F). From this we can deduct that pressurization, air conditioning and refrigeration will have to be a part of every aircraft which will fly at these higher altitudes.

TYPES OF CONSTRUCTION. Heretofore aircraft structures have been designed to withstand comparatively steady loads, but if we intend to go faster these structures must be able to withstand heavier instantaneous loads and high skin temperature. Our experience in the past war presented the problems of erosion and corrosion which are very important factors affecting the life and reliability of structures.

Sandwich construction is just what the name implies, a sandwich. In general, it is a structural member consisting of a relatively thick, light weight core and a relatively thin, high density face. The most promising example of this type of construction is a laminated plastic, filled with glass fabric. Other types of filler have been used such as cotton, wood, nylon, paper and high strength rayon, but none are equal to glass fabric in strength per unit weight. Core materials may consist of balsa wood, extruded cellulose acetate containing 3% chopped glass fibers, and expanded hard synthetic rubber. This type of construction presents new but fairly easy problems of maintenance.

Honeycomb construction is actually a core for sandwich type construction. It consists of a substance such as a layer of thin (.003 inch) glass fabric, plastic-molded in the form of 3/15 and 1/4 inch cells, like a bee's honeycomb, and may be used as structural members in cargo floors, radar domes, shelves, etc., but will probably not be used in airfoil construction because of the difficulty in contouring.

Thick skin construction may be used to form thin, high strength airfoils having very little internal structure. This type of structure is formed by milling out a solid section, or by forming and fabricating from thick sheet stock. This type of structure presents complicated and costly maintenance. Further, the skin thickness may be tapered from wing root to wing tip.

Solid construction is also possible; a solid airfoil with the exception of possibly a few drilled holes for controls. This type of construction will meet all of the requirements except weight. The cost and complication of maintenance are even greater than in thick skin construction.

Methods of joining materials have always presented the problem of concentrated stress in all types of structures except those in which weight is not considered. Great improvements are being made in this field by improving methods of welding, by improving the weldability of metals and by the use of adhesives; the latter being very good in strength and weight but not so good in resistance to the effects of heat.

MATERIALS. Research in materials is limited by production requirements. In other words, it is fruitless to develop structures using materials that are scarce, because mass production would be impossible.

Ceramics are not as yet considered a structural material for aircraft but their use as protective coatings against corrosion, effects of heat and erosion show good possibilities.

FIRST ACCEPTANCE
May 1949

The latest version of Republic's "Thunderjet" fighter - F-84E, features many improvements over earlier models which have greatly increased its worthiness and capabilities. By installing an Allison J-35-A-17 turbojet engine, thrust has been increased by 25% - combat radius, service and maneuverability have likewise been improved. The nose section of the fighter has been lengthened 15 inches, in order that cabin pressurization and air conditioning might be incorporated for increased pilot room and comfort. Wing and tail sections have been strengthened to withstand greater stresses. In addition to "splitting" the fuselage to permit rapid engine change, which now can be accomplished in less than 50 minutes, 180 access doors have been provided to facilitate speedier servicing. F-84E's are now in production.

FIRST FLIGHT
October 1947 (XF-86)

FIRST ACCEPTANCE
May 1948

Designed primarily as a high altitude fighter, the "Sabre" was the first supersonic combat aircraft to go into quantity production. Included in the features of the plane are swept back wing and empennage, electrically adjustable horizontal stabilizer, hydraulically operated speed brakes, automatic wing leading edge slats and hydraulic boost control for ailerons and elevators. Flush gun doors are incorporated in the design, and open when the guns are fired. A Type A-1B gun-bomb-rocket sight is provided and is used in conjunction with the radar ranging equipment. Provisions are made for carrying either bombs or rockets externally. In September 1949 the F-86 exceeded 710 miles per hour and 57,000 ft. in flight tests.

FIRST FLIGHT
August 1948

The Northrop XF-89 is an all-weather fighter designed for tactical operations at night or under unfavorable weather conditions. The reason for the stabilizer being placed so high is to keep it free from the hot gases from twin tail exhausts. This also diminishes the effect upon the stabilizer of the turbulence caused by the airflow over the plane's wing. It is equipped with remotely controlled turrets, pilot ejection seat as well as for thermal anti-icing.

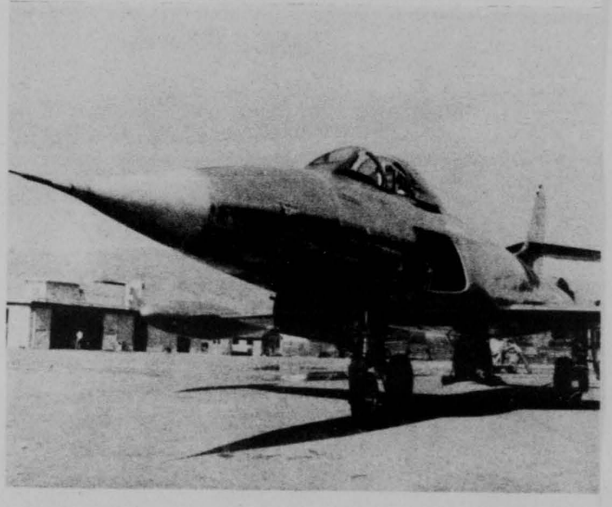
FIRST FLIGHT
June 1949



The Lockheed XF-90 is a 15 ton jet penetration fighter, combining speed, range and maneuverability. It readily lends itself to assembly-line production. It has conventional tricycle landing gear and a pilot ejection seat. The cabin is pressurized and air conditioned. Large (220-gal) wing tip tanks help to give the fighter unusually long range for a jet plane. This aircraft is powered by two (2) Westinghouse J-34 turbojet engines, with Solar afterburners. The XF-90 has now made more than 25 successful flights.

The XF-91 is designed as a high altitude interceptor for local defense against long-range bombers and guided missiles. It is powered by a turbojet engine with rocket motors for accelerated take-off and climb and for operation at extreme altitudes. The main landing gear is composed of two wheels mounted in tandem, which fold up and out into the razor thin wings. The unique inverse tapering of the wing is designed to solve the problem of frequent wing tip stalling at low speed of the conventional swept wing. Taxi tests have been completed.

FIRST FLIGHT
July 1949

Lockheed's F-94 is an all-weather fighter version of the F-80 "Shooting Star", designed to fly and fight in almost total darkness. Its mission will be high altitude interception especially under adverse weather and visibility conditions. The most striking difference between the F-94 and F-80 is the greatly extended nose section housing the ships new radar equipment wich is designed to search out and destroy enemy aircraft. All hydraulic, electric and control systems are the same as those used in the F-80, consequently men already trained in the maintenance of F-80's will experience little difficulty in servicing F-94's.

FIRST FLIGHT
October 1949

The basic mission of the XC-123 is the transport of combat personnel and engineering equipment for airborne assault troops, particularly into small unprepared fields in forward combat areas. Tow-fitting capacity for a 30,000 lb glider is provided in the rear. Tow-fittings in the nose are provided for snatch pickup and towing. An integral power operated ramp provides for rear loading of heavy wheeled vehicles. No special provisions are required for vehicles up to 6500 lb per wheel. It can carry a 155 mm Howitzer Type M1A1. The ramp can be adjusted to any truck bed height for loading. All cargo tie-down fittings are of 10,000 lb capacity.

FIRST FLIGHT - July 1948

The B-36B is a long range, high altitude, heavy bomber. The fuselage consists of a forward pressurized cabin, one non-pressurized turret bay, four non-pressurized bomb bays, aft pressurized cabin and the non-pressurized rear fuselage section. Cabin heating, defrosting of blisters and enclosures; and anti-icing of propellers, wing and tail are accomplished by heated air. The defensive armament consists of eight remotely controlled turrets, six of which are retractable. The major differences between the B-36A and the B-36B include an increase in engine horsepower with fluid injection from 3000 to 3500 hp, provisions for larger bombs and additional radio equipment. In addition to its regular reciprocating engines, the B-36 will be equipped with four J-47 jet engines mounted in pairs beneath each outer wing, for added take-off power and speed over target.

FIRST FLIGHT - Mar '47 (XB-45)

The primary mission of the B-45A is the destruction of land or naval material objectives. The aircraft is a light bomber, comparable in size and range with World War II heavy bombers. Special features provided in this aircraft consist of thermal anti-icing, cabin pressurization, heating and cooling, ejection-type seats for pilot and co-pilot, and emergency escape hatches for bombardier-navigator and tail gunner. Communications equipment, emergency flight controls and instruments are installed at the co-pilots station. A Type E-4 automatic pilot and navigation-bombing radar are installed as standard equipment. Also provided is a radar-controlled tail turret. The aircraft is the first jet bomber produced in quantity for the Air Force. All models can accommodate JATO installations which are droppable after takeoff. Due to the high operating speed, the B-45 is equipped with radar navigation and bombing systems.

FIRST FLIGHT
December 1947 (XB-47)

The Stratojet is a high-wing medium bomber powered by six jet engines slung beneath the wings. Two engines are mounted in a single nacelle on each side of the fuselage. An additional single engine nacelle is mounted near each wing tip. The wings and stabilizer are sharply sweptback, giving an arrow-like appearance. The fuselage is long and narrow with a tapering high fin. The tail cone extends beyond the rudder. The B-47 has a retractable bicycle landing gear composed of two-wheel trucks with small wheels extending from the inboard nacelles for balance. There are JATO tube openings in the fuselage sides aft of the trailing edge of the wing.

FIRST FLIGHT
June 1947

The B-50A is a long range high altitude medium bomber. Cabin heating, ventilation and pressurization are incorporated for increased crew comfort on high altitude long range missions. The defensive armament is housed in five electrically operated turrets which are remotely controlled from sighting stations. Principal improvements over the original B-50 model include such changes as new radar equipment, plexiglass nose section, modified four-gun top forward turret and single-point ground refueling. Important from a maintenance viewpoint are the interchangeable "power packs" each of which incorporates a 3500 hp Pratt-Whitney Wasp Major engine, a General Electric turbosupercharger, oil tank and system, generators and engine accessories. Four men can remove an entire "power pack" and replace it with a pre-tested unit in less than one-half hour.

FIRST FLIGHT
October 1949

The Martin XB-51 is the first postwar airplane specifically designed for the destruction of surface military targets in cooperation with air, ground and/or naval targets. Radical in design, with a wing sweep back of 35 degrees and horizontal stabilizer mounted "T" style atop the vertical stabilizer. The plane is flown by a two man crew in a pressurized, air conditioned cockpit with pilot ejection seats. Dual main wheels are mounted bicycle style and retract into the fuselage, balance during taxi runs being maintained with small outrigger wheels at the wing tips. The XB-51 is versitile in operations to and from combat area fields. For take-off under such conditions, the bomber is equipped to use JATO bottles, and for landings, it has a parachute stowed aft for more rapid decelleration.

FIRST FLIGHT
Nov '44 (XC-97)

This huge double deck airplane is the cargo counterpart of the Boeing Stratocruiser, now in production for major world airlines and is also the transport counterpart of the B-29 and the B-50. The entire fuselage is altitude and temperature conditioned, allowing transportation of perishable goods at high speeds. The unobstructed upper deck is reached through large clam-shell type doors in the rear underside of the fuselage. Two lower compartments are reached through step-contained doors at truck-bed-height. The airplane can carry fully equipped troops or combinations of heavy guns, tanks, or trucks. Mobile equipment can drive into the upper deck on self-contained ramps, which are stowed internally when not in use. An electrically-operated overhead monorail crane travels the entire length of the upper deck cargo compartment, allowing loading and unloading of cargo without extra ground equipment.

FIRST FLIGHT
December 1947 (C-119A)

The tactical mission of the C-119B is to transport cargo, personnel, litter patients, airborne supplies, mechanized equipment and/or paratroops. Provisions are made for glider tow. The crew of five includes pilot, co-pilot, navigator, radio operator and crew chief. No combat protection is provided. The large rear doors open to maximum cargo compartment dimensions to provide rapid unobstructed loading and unloading of cargo. Jump doors in each of the main cargo doors provide exit for paratroops. Paracans may be dropped in flight thru doors in the floor of the forward cargo compartment. Special features include - thermal anti-icing, Loran, reversible pitch props, and bladder type fuel cells. This aircraft is an improved version of the C-82 "Flying Boxcar". The principal change is the relocation of the flight deck for improved vision.

The basic mission of the C-124A is to carry maximum cargo or combat equipment to a remote base and return without refueling. The airplane is capable of carrying a fully assembled heavy Ground Force, Air Force and Ordnance Equipment in the main cabin. Clam type nose loading doors and an electrically operated elevator provide loading facilities. An auxiliary folding floor is provided in the main cabin. The crew of five includes a pilot, co-pilot, flight engineer, navigator, and radio operator. A relief crew of three is carried for long flights. Fuel combustion heating units provide cabin heat through side wall and floor ducts. Wings and tail are equipped with thermal anti-icing system. Other features are Loran, stowable auxiliary floor, integral loading ramps and traveling hoist.(16,000 lb).

THIS PAGE IS UNCLASSIFIED

Continued from page 11

This is especially true in the case of jet tail pipes and turbine blades.

ALLOYS. The bulk of our aircraft today are constructed largely of alloys in one form or another. The newest practical alloys are those of magnesium in the form of casting. The reason that these alloys are very promising is that magnesium itself is present in great abundance and is one of the lighest of the alloy structural materials known. All of the aluminum alloys are being considered as to how they can be improved, with some success. Beryllium, a very high strength, light element, has excited the designers for the past few years, but unfortunately ores are not available in quantities sufficient for exploitation. Titanium, available in greater quantities, shows possibilities for use in heat resistant alloys.

Plastics show great promise in the future if the effects of heat can be controlled. In general, temperatures above 150°F are detrimental to plastics; however, the ability of plastics to resist corrosion is much better than any of the other structural materials.

AIRCRAFT PROPULSION PHASE

Factors necessitating change from propeller to jet propulsion.

As stated earlier, to travel at greater speeds we must produce the necessary thrust. Until a few years ago we had been providing thrust by means of a propeller, but this method has proved unsatisfactory due to the fact that the resultant velocities on an average propeller tip are above the speed of sound when the aircraft is traveling only 400 mph at sea level. Of course, there are designs for propellers, such as sweptback blades, that will overcome this difficulty at 400 mph only to recur again at, say, 500 mph. Therefore, the jet engine has been developed in order to give us the desired thrust. The jet too encounters many problems, such as heat, cold weather operation, fuels, etc.

PROBLEMS OF ENGINE FUELS. In the past war, 2/3 of all tonnage shipped overseas consisted of petroleum products. During March 1945, 280,000,000 gallons of gasoline were used, representing 816,000 tons of petroleum products shipped that month. We were burning this gasoline at the rate of 50 to 160 gal/hr per engine depending on throttle setting and engine size.

Now let us see what happens when we attempt to attain higher speeds using jet thrust. We burn anywhere from 250 to 400 gal/hr/engine in conventional jets and if we go into liquid rocket engines such as used in the XS-1 we will use approximately 106 gal/min of alcohol and 150 gal/min of liquid oxygen.

If we try to increase the octane rating of conventional fuel in order to increase horsepower, we increase evaporational losses, which are already high enough. One B-29 flying from the Mariannas to Japan and return would lose as much as 500 gallons due to evaporation. If we pressurized from 3 to 7 lbs/sq in. to reduce evaporation it would actually apply a force of 4,000 lbs or more in the tanks depending on size of tank, involving a structural problem and flak hazard.

Jet fuels have been mainly kerosene. But kerosene, although it has no vapor loss, does crystallize at -45°F and solidifies at -85°F. With kerosene we also have a problem of low fuel-air ratio explosive mixture

RESTRICTED

1428

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

which could be a fire hazard providing we are traveling fast enough to encounter high skin temperatures.

Rocket fuels such as liquid oxygen or alcohol also present problems mostly of handling, and large quantity sources of supply. For instance, liquid oxygen boils at -285° F, resulting in high evaporation losses, and also requires special non-freezing valves in the operating systems.

ENGINE TECHNOLOGY AND THEORY. Thrust vs. Horsepower. We have customarily used the term horsepower when describing the actual energy output of a reciprocating engine, but when speaking of jets we express output in terms of thrust. The reason for this is that horsepower takes into consideration force applied for a given distance, for a given length of time (ft. lbs/sec) but thrust is actual force applied (lbs) to moving aircraft. When we speak of horsepower in a conventional aircraft we are merely speaking of the power going into driving the propeller. The propeller produces the thrust (lbs) that moves the aircraft, and this greatly depends on the pitch and size of the prop.

Conversion of thrust to horsepower is as follows:

Horsepower = Thrust multiplied by speed divided by the constant 375. Example — A jet engine producing 3,750 lbs thrust at 600 miles per hour is actually developing 6,000 horsepower. However, this is just the horsepower going into the thrust. If the jet is turbo jet, the horsepower going into the thrust is only 1/3 of the total developed. Thus, in the same example as above the 6,000 horsepower going into thrust represents only 1/3 of the total developed. Thus, 18,000 horsepower is actually developed; 12,000 to the compressor and 6,000 to the jet energy. From this we conclude that the thrust is only a fraction of the actual horsepower developed, and is the actual energy available to move the aircraft by the reaction theory.

REACTION ENGINE THEORY. To understand the theory of reaction engines (jets and rockets) one must first dispel the idea that the thrust coming from the jet is pushing against the other air, resulting in a forward motion.

There are two principles to recall from physics. One is, if we accelerate a mass we have a potential force equal in magnitude to the force multiplied by the acceleration (F = ma). Second, that for every action there is an equal and opposite reaction. Thus, if we accelerate a mass we have a force or action to which there is a reaction. This is exactly what we do in a reaction engine. We accelerate a mass of air by heating a great quantity of it in a confined space and expanding it through a duct. To this action there is an equal and opposite reaction in the form of thrust on the component parts of the engine and resultantly on the aircraft. Barring the need for oxygen from the air, this could just as well take place in a vacuum.

Turbo jets. Centrifugal flow type consist of a single faced or double faced centrifugal impeller (compressor). Has few practical troubles but does necessitate a larger frontal area than the axial flow. However, it is better under icing conditions.

Axial flow type consists of a multi-stage compressor which is more efficient than the centrifugal flow type, but more expensive and difficult to construct. It has more parts, less frontal area and is more susceptible to icing than the centrifu-

1429

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

gal type.

Turbo prop jet is basically a turbo-jet (either type) engine with a propeller geared to the compressor-turbine shaft. At present it has the best chance of replacing the reciprocating engine in the commercial field. In this type of engine 2/3 of our developed horsepower still goes to the compressor and of the remaining 1/3, the propeller absorbs about 80%, leaving about 20% of 1/3 (or 6%) available for jet thrust.

Compound engines. This type of engine is an improvement over the conventional reciprocating engine. Compounding is accomplished by adding a turbine splined to the engine crank shaft so that any power produced by the turbine will be delivered to the propeller by the crank shaft and thereby supplement the power output of the reciprocating engine. The way the turbine develops power is by extracting energy from the exhaust gases of the reciprocating engine. This is accomplished by merely routing the exhaust through the turbine instead of to the atmosphere and thereby adding about 3% to 4% more shaft horsepower to the total output. It is well to note that this is not a turbo supercharger, wherein the exhaust gases drive a turbine in order to compress air into the carburetor. By using the system of compounding we can increase the total output of a reciprocating engine without adding additional fuel, thus we increase the amount of horsepower obtained for a given amount of fuel consumed.

After-burning. This is a method of re-energizing the exhaust gases of a turbo-jet or a compound engine by introducing more fuel and possibly more air (from external source) to the jet stream after the turbine stage has been completed. This takes place in the tail pipe and in principle reheats the gases and accelerates them considerably, resulting in increased thrust. Of course, we expend more fuel to do this but under ideal conditions with proper mixture we can even decrease the fuel consumption per pound of thrust developed.

Another possible combination of engines is the use of a reciprocating engine to drive the compressor of a reaction engine, thereby eliminating the turbine and corresponding energy losses. Even though this appears to be a good idea, it was found that the total engine weight per pound of thrust developed was exceedingly high, as was the total fuel consumption per pound of thrust.

MILITARY CHARACTERISTICS

Military characteristics have been established for four types of fighters and two reconnaissance type aircraft. Helicopters are being developed to perform search and rescue and transport missions. Research airplanes such as the S-1 are designed without military characteristics but with a definite objective in mind. Trainers are now being designed to meet the approval characteristics for this class.

Military characteristics are contained in a high level staff document that sets forth the requirements for aircraft as determined by a board of senior Air Force Officers. Military characteristics are defined as "those essential qualities which an item of equipment must possess in order to fulfill a definite military mission."

At present funds are not available in all cases to translate the military characteristics into developed actualities. The possibility of an

1430

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

increase in the funds now being allocated to the Air Forces may enable us to increase the tempo of our research and development program.

The following types of aircraft indicate the basic trends in service aircraft development.

FIGHTERS

PENETRATION. The penetration fighter is designed for operations well within enemy territory. Its mission will be similar to that of the F-47s and F-51s in the past war. The penetration fighter will be the mainstay of the Fighter Command. It should have long range, high speed (above 600 knots), and be able to outmaneuver any aircraft it will be called upon to fight in combat. This airplane will have a pressurized cockpit. It will carry at least 6 guns and in all probability it will be a large, heavy airplane.

INTERCEPTOR. The interceptor is a specialized airplane to be used for locality defense. It must have a very fast rate of climb, high speed to intercept other aircraft or missiles, and a duration of flight of near one hour. This aircraft may be rocket powered and launched from a vertical position. It may be that the interceptor will be classified as a research type airplane due to its flight duration.

ALL-WEATHER. The all-weather fighter is required to operate in adverse weather and at night. It will use radar gun laying equipment, radio and radar navigational aids and the latest blind landing equipment. This type airplane is a successor to the F-61. It should be able to perform almost as well as the penetration fighter, as it will be used when the penetration fighters will be grounded due to weather or night.

The all weather airplane must be very strongly built to withstand thunderstorm flying in addition to carrying all the aforementioned electronic aids and should be easy to control at low speeds.

The all weather fighter must effect a good compromise between combat radius of action and rate of climb as it may be called upon to perform many varied missions.

"PARASITE" OR STOWED FIGHTER. The parasite fighter is a development that may be necessary because of the very long range of our new heavy bombers. It is an impossibility for our present penetration fighters to accompany our heavy bombers on very long range missions and as these bombers may need fighter protection, the "parasite" fighter could be the answer. The parasite fighter is designed to be carried and launched from the bomb bays of heavy bombers. It will have no landing gear, only a launching hook. It should be small, fast, heavily armed and able to operate at high altitudes. The parasite fighter will be designed so it can be refueled and rearmed while in the bomb bay of the mother ship. Duration of flight should be more than 30 minutes.

RECONNAISSANCE

Only periodic attempts were made to develop aircraft for purely photographic purposes prior to the last war.

During the early part of the war, fighter aircraft such as the P-38, P-47, and P-51 were equipped with cameras and used for tactical reconnaissance purposes. As the war progressed and longer and longer raids were made by bombers, it became necessary to have longer range reconnaissance aircraft to use in

1431

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

connection with strategic bombing. Bomber aircraft such as the B-17 and B-24 were equipped with cameras, and later the B-29 was used.

HELICOPTER

Military characteristics for search and rescue helicopters are established and have been submitted to contractors. It is believed that helicopters will become increasingly important in air rescue work. Heavy lift helicopters will be designed as short haul transports for combat use. Many companies in this country are designing and building helicopters.

It is a fact that a helicopter can outperform a horse, an automobile, an airplane -- even a bird. The helicopter can fly low and slow, high and by surface standards, fast, sideways and rearwards, straight up or down, it can stand still in the air, revolve on its axis, hop hedges or mountains, taxi on the ground, land in a back yard or on a roof, alight on water or a ship's deck. For all it can do now and all it promises in the future, the helicopter is not without some major problems. Technical development is barely begun; governmental regulations are a serious impediment for commercial development, and there appears to be a basic limitation on speed; however it is believed that its top speed may be pushed as high as 150 miles per hour.

RESEARCH AIRCRAFT

In the research aircraft field, desirable requirements for a supersonic research airplane have been tentatively established after much study of the problems involved and the results desired.

Design studies are being carried out not only in airfoil shapes and power plants but also in fields of medicine, metallurgy, plastics, textiles and other allied arts and sciences. The effective research and development carried on in the associated arts will help determine the success of our research program in airfoils, power plants, structures, armament, materials, and escape provisions.

TRAINERS

The Air Force is now buying two types of trainers, single engine and twin engine. The single engine will be used for basic and advanced flying training and the twin engine will be used for advanced schools and for navigator and bombardier training.

Trainers are still using the engine-propellor combination as a source of power.

D/I, Reqmts Div. Rest.

The Air Intelligence Handbook has been distributed by Continental Air Command Air Forces in accordance with the following minimum standard:

a. RESERVE FORCES UNITS: One (1) copy to each echelon down to and including squadron level; except Intelligence Volunteer Units which will receive one (1) copy for each ten (10) personnel.

b. AIR NATIONAL GUARD UNITS: One (1) copy to each echelon down to and including squadron level.

c. AIR ROTC UNITS: Two (2) copies to each PAS&T.

d. REGULAR UNITS: One (1) copy to each echelon down to and including squadron or comparable level.

Due to cost limitations the "Handbook" was published in limited numbers, necessitating a controlled issuance to units only.

GLOSSARY

AFTERBURNING - Increases both mass and velocity of exhaust gases passing out through the jet by igniting fuel as it is sprayed into the hot exhaust gases in the aft portion of the jet exhaust pipe. This adds to the total thrust of the jet engine without exceeding the critical speed of the turbine.

AIRFOIL - Any surface of an aircraft designed to help in lifting or controlling the aircraft by making use of the current of air through which it moves. Wings, ailerons, rudders, etc., are airfoils.

CAMBER - The rise and fall of the curve of an airfoil section.

COMPRESSIBILITY - When speeds of 500 to 700 mph (or close to the speed of sound) are attained, the molecules of air displaced by the wing cannot travel fast enough to close in behind the airfoil, resulting in a disturbed region of relatively rarified and turbulent air on the surface of the after portion of the wing. Depending on the speed, either a stall or compressibility burble (or a combination of the two) is set up which disrupts the normal functioning of the wing and controls.

FLUID INJECTION - The technique of injecting metered fluid directly into the combustion chambers of an engine to increase vaporization of fuel and decrease temperature of the combustable mixture, thus preventing predetination.

G FORCE - Is the unit measure of earth's attraction (gravity) and centrifugal force. Downward pressure on a body is called positive acceleration (+G). Conversely, in negative acceleration (-G) bodily pressure is upward. Weight is determined, during rest, by the vertical attraction (gravity) exerted by the earth. When seated, then, downward pressure on the body will equal its weight or 1G. Body pressure twice its weight would equal 2G's, as centrifugal force increases beyond 1G. Supporting structures must be strengthened accordingly. The effects of centrifugal forces are determined by: direction - with respect to the body, magnitude and duration.

HORSEPOWER - Theoretical unit of work; one horsepower equals 33,000 lbs raised 1 ft. in 1 minute.

HORSEPOWER OF JET - Equals pounds of thrust times speed in miles per hour divided by 375. $\frac{\text{Thrust X Speed of A/C}}{375}$

PROTOTYPE - An original from which others are copied.

MACH NUMBER OF AN AIRCRAFT - Velocity of aircraft divided by velocity of sound. The

1433

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

velocity of sound varies directly as to the air temperature; that is, the higher the temperature, the higher the speed of sound.

DESIGNATOR ASSIGNMENT- Aircraft will be assigned a basic type designator in accordance with the function for which they are basically designed. When a type of aircraft is modified to perform a function other than its basically designed function, the basic type designator will be prefixed by the appropriate auxiliary symbol. Aircraft will not be redesignated merely on the basis of current usage.

Type - The basic type designation will consist of one letter as follows:

A....Amphibious	*L....Liaison
*B....Bomber	*Q....Target Aircraft and Drones
*C....Cargo	*R....Reconnaissance
*F....Fighter	*S....Search and Rescue
*G....Glider	*T....Trainer
H....Rotary Wing (Helicopter)	**X....Special Research or Experimental

NOTE: *To be used as prefix symbols as required.
**To be used as a classification symbol as required.

Model - A particular model of a given type will be designated by a number or numbers separated from the preceding type letters or letter by a dash, such as B-50.

Series - Following the model number there will always be a series letter, such as B-50A. (This provision is not retroactive.) The letters "O" and "I" will not be used. The series letters of a model will be changed when:

a. A change is made in the engine which materially affects the engine performance rating or seriously affects the interchangeability in the aircraft.

b. A change is made in propellers which affects interchangeability (Curtiss instead of Hamilton Standard) or flying characteristics of an aircraft (13'6" propellers instead of 12'6" propellers).

c. A major change is made in primary installed armament (addition of chin turret, addition of side guns, installation of 20mm guns instead of .50 caliber, etc.).

d. A major change is made in structure and/or equipment installation affecting interchangeability.

PREFIX SYMBOLS - The symbols listed below will be used as prefix symbols to indicate the current usage of an aircraft when it is so modified that its originally intended usage is no longer applicable. Authorization for the use of these symbols will be obtained in accordance with section III of this Regulation. Modification of aircraft, except as noted herein, is not authorized without appropriate redesignation. As an example of this redesignation, a B-50A-10-BO aircraft modified as a reconnaissance aircraft will be redesignated an RB-50A-10-BO. An aircraft so redesignated will retain this prefix until such time as those features which provided its reconnaissance characteristics are removed and it is restored to its original basic condition or remodified for an entirely different function. Only in exceptional cases will more than one prefix symbol be used to designate an aircraft. Such an exception could occur, for example, if an RF-80 is modified for reconnaissance training. It would then be redesignated as a TRF-80. However, if it is modified for normal training purposes, it should become a TF-80. If more than one prefix symbol is used,

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

the first symbol from the left will be considered the primary prefix symbol and the next one the secondary prefix symbol.

Prefix "B" - The prefix symbol "B" will be used to designate aircraft modified to function as bomber type aircraft, i.e., the inclusion of a bombardier nose in fighter type aircraft. The addition of external bomb, torpedo, or depth-charge carrying devices and dive or skip bombing sighting equipment on any basic type aircraft does not constitute sufficient cause for the redesignation of that aircraft as "B" type.

Prefix "C" - The prefix symbol "C" will be used to designate aircraft specifically modified for cargo use. Basic type aircraft utilized for cargo purposes without modification will not be redesignated with the prefix "C".

Prefix "D" - The prefix symbol "D" will be used to designate those aircraft which are modified to function as director aircraft in conjunction with remotely controlled aircraft or guided missiles. (See AFR 58-5)

Prefix "F" - The prefix symbol "F" will be used to designate basic aircraft modified for fighter operations. The addition of rocket launchers on liaison or rotary wing aircraft does not constitute sufficient cause for redesignation as "F" type aircraft.

Prefix "G" - The prefix symbol "G" will be used to designate those powered aircraft after modifications removing all means of self-contained thrust have been completed.

Prefix "K" - The prefix symbol "K" will be used to designate all aircraft modified as air-to-air refueling tankers.

Prefix "L" - The prefix symbol "L" will be used to designate aircraft modified for liaison missions. The use of this prefix will be extremely limited.

Prefix "M" - The prefix symbol "M" will be used to designate aircraft modified for use as missiles. (See AFR 58-5)

Prefix "Q" - The prefix symbol "Q" will be used to designate basic aircraft modified through the inclusion of special electronic equipment for use as targets or drones.

Prefix "R" - The prefix symbol "R" will be used to designate those basic aircraft which have been so modified as to make them suitable for reconnaissance missions, i.e. weather reconnaissance, photo reconnaissance, etc.

Prefix "S" - The prefix symbol "S" will be used to designate basic aircraft modified through the inclusion of special search electronic equipment, airborne life boats, life rafts, or extensive life saving equipment, etc. This symbol will not be used to redesignate those aircraft utilized for air evacuation of litter patients.

Prefix "T" - The prefix symbol "T" will be used to designate those aircraft which have had equipment removed to make them more suitable for training purposes. This symbol also will be used to designate those aircraft modified through the inclusion of special training equipment, i.e., navigator trainers, engineer trainers, etc. Aircraft used for training purposes for which authorization to remove equipment has not been granted, will not carry the prefix "T". "T" prefixed aircraft will not be considered suitable for return to combat status; therefore, the "T" prefix normally will not be authorized to combat potential aircraft.

1435

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Prefix "V" - The prefix symbol "V" will be used to designate those aircraft which are modified as staff administrative transports. This will include modified cargo types wherein the modification is not indicated by a series letter. Staff administrative transports will include all aircraft with passenger seat, chair, or lounge installations and other accessories other than crew type seats.

CLASSIFICATION SYMBOLS - Aircraft may have any one of the following classification symbols applied where applicable.

Classification "E" - The classification symbol "E" (Exempt) will be used to designate those aircraft on special tests or experimental projects by authorized activities and for aircraft on bailment contract (Work contracted for by a nonmilitary agency using AF-owned aircraft). This will not include aircraft undergoing contractual removal from storage, reconditioning, modification or modernization to meet an Air Force program, requirement, or characteristic. Aircraft utilized in special tests, experimental projects, or bailment contracts that have not received modifications and where the interchangeability of the aircraft with like type, model, and series aircraft has not been affected, will not be classified with the symbol "E". At the termination of tests, etc., "E" classified aircraft will either be returned to their original condition and designation or, if certain modifications become a permanent part of the aircraft, an appropriate redesignation of prefix, series, or block, other than "E", will be made. The "E" classification is not applicable to "X" classified aircraft.

Classification "X" - The classification symbol "X" will be used to designate experimental aircraft and indicates that the item being developed has not progressed to the stage where engineering tests indicate that the item is sufficiently satisfactory to warrant service tests. This classification also will be used to designate production aircraft that have been so modified for experimental or other reasons as to make them permanently unsuitable for an operational or training requirement, i.e.,the experimental installation of R-4360 engines in B-29 aircraft,the experimental installation of tandem landing gear on B-26 aircraft, etc.

Classification "Y" - The classification symbol "Y" will be used to designate those aircraft which have the required military characteristics and are of a quantity produced to develop the potentialities of the model. This classification indicates the item has been developed beyond the experimental stage, but is not ready for classification as an adopted item.

Classification "Z" - The classification symbol "Z" will be used to designate aircraft which are considered by the Chief of Staff, USAF, to be obsolete and of and for which no further procurement will be made. Obsolete aircraft are those aircraft that are declared unsuitable for their original military purposes or for training purposes.

The assignment of a classification symbol to an aircraft will replace any prefix symbol which the aircraft currently possesses, except where the aircraft concerned retains those characteristics and/or equipment which previously classified it under the type indicated by the prefix. In such exceptional cases, the assignment of the classification symbol will be in addition to the prefix symbol. For example, if an RB-17 is placed on bailment contract and is modified, but still retains its reconnaissance features, it would be reclassified as an ERB-17. However, if its reconnaissance equipment is removed, it would become an EB-17. On the other hand if this aircraft is completely superseded by more modern aircraft, it would become a ZRB-17. If, while still in service, the reconnaissance equipment is removed, it then becomes a ZB-17. In no instance will the aircraft classification, prefix, and type designator exceed three symbols. In the event a classification symbol is assigned an aircraft already designated with two prefixes only the most important prefix will be retained.

AIR FORCE LETTER)
NO. 205-30)

DEPARTMENT OF THE AIR FORCE
WASHINGTON, 10 MAY 1949

SECURITY

Identification of Persons for Access to Classified Information

(Effective until 10 November 1950 unless sooner rescinded or superseded.)

	Paragraph
Purpose	1
Policy	2
Responsibility	3

1. Purpose. This Letter directs the attention of all personnel to the necessity of assuring themselves of the identity of persons, military or civilian, with whom they may discuss, or otherwise reveal, classified information.

2. Policy:

a. No person is entitled solely by virtue of his grade or position to knowledge or possession of classified matter. Such matter will be entrusted only to those individuals whose official or other Governmental duties require the knowledge or possession. This principle applies equally to command control over the dissemination or distribution of classified matter as well as to individual discussions.

b. The discussion of classified military information, either public or private, with or in the presence or hearing of any person not authorized to have knowledge thereof, is strictly forbidden. Care must be exercised at all times not only to refrain from discussing classified military information with or in the presence or hearing of unauthorized persons, but also to prevent inspection of or access to such information by unauthorized persons.

3. Responsibility. Specific measures and precautions to be employed for controlling access to classified information will include, but will not be limited to the following:

a. Before classified information is discussed, exhibited, or revealed in any manner whatsoever, it is necessary that the intended recipients of the information be:

(1) Completely and indisputably identified.

(2) Cleared to receive the highest security category of information to be discussed, exhibited, or otherwise revealed.

(3) Entitled to and in need of the information in the performance of official military or other Governmental duties.

b. Individuals who conduct conferences, meetings, or briefings or who authorize the disclosure of classified information in any manner whatsoever, will be responsible for full compliance with a above, and will maintain a continuing awareness to prevent unauthorized persons from receiving such information.

c. Individuals attending conferences or meetings, including formal committee meetings, regardless of their nature, will not discuss classified information unless assured that all persons present have been authorized to receive all elements of the information.

d. The wearing of a uniform does not by itself serve to identify or qualify a person to receive classified information.

e. When classified military information is discussed, exhibited, or revealed in any manner to persons who are subject to military law or employed within the National Military Establishment, they will be informed of its classification.

f. When classified information is discussed, exhibited, or revealed in any manner to persons who are not subject to military law or employed within the National Military Establishment, they will be informed that it affects the National defense of the United States within the meaning of the Espionage Laws and that its revelation to an unauthorized person is prohibited by law.

g. The delegation of authority to release classified information by the responsible individual to his assistants, either military or civilian, does not relieve that individual of his responsibility in the matter.

BY ORDER OF THE SECRETARY OF THE AIR FORCE:

*This Letter supersedes AFL 205-30, 3 September 1946.

AIR INTELLIGENCE Review

This "Review" is published for three reasons:
1. To provide timely data regarding new techniques, practices and general information whereby intelligence personnel can maintain proficiency.
2. To provide material which will afford all personnel an appreciation of the intelligence role.
3. To provide a medium whereby all intelligence personnel and activities may exchange viewpoints, problems and solutions.

Two types of material are solicited for publication:
1. Stories and pictures relating to the intelligence activities being conducted within an organization.
2. Original articles of a nonconfroversial but informative nature.

Material submitted must include sources utilized and the authors name, rank and present military affiliation. Mail stories to: The Editor, "Air Intelligence Review," ConAC, Mitchel Air Force Base, New York.

EO 11652

THE AIR-GROUND TEAM

BY GENERAL JACOB L. DEVERS

Success in battle depends upon the integration of all available forces and weapons. A preponderance of manpower and industrial production alone does not insure victory. Nor does individual proficiency of separate armed forces guarantee defeat of the enemy. Victory is the end product of operations carried out jointly, utilizing combined firepower, backed by superior resources and manpower.

In its broadest sense, the team concept is the foundation of our entire military structure. At the highest level of the military hierarchy, Army, Navy, and Air Force are each assigned their respective missions--not as separate entities but as members of the Armed Forces team. Individual fields of action may be far separated, but this detracts none the less from their relation to one another. Naval action and Air Force strategic bombing, for example, sever lines of communication and destroy factories, thereby stifling the enemy's economy. This means less equipment produced and thus fewer divisions to fight in the inevitable invasion of the enemy's stronghold.

But we achieve the ultimate in teamwork on the field of battle. There Army and Navy, Army and Air Force, or Army, Navy, and Air Force join their means to achieve a smoothly-functioning battle team. Most extensive are the joint operations pursued in conjunction with Tactical Air Forces. Great importance must also be ascribed to the troop-carrier support role of the Air Forces, but this discussion will be limited to tactical air support of ground operations other than airborne.

Front-Line Service

Operations of the Tactical Air Forces include indirect support missions, such as establishing and maintaining local air superiority, isolating the battlefield, and performing tactical reconnaissance; but it is with the direct support mission of the Tactical Air Forces that I am most concerned when I speak of the air-ground team. The latter involves the attack of enemy ground forces within the zone of contact with our own ground forces. From the airman's point of view, this is a hazardous, highly exacting operation. He is attacking a target which is only a few hundred yards--in extreme cases even less than 100 yards--from our own ground troops. Since he must attack at low altitude to identify his target and deliver his fire accurately, he is subjected to withering fire from enemy ack-ack and small arms.

Yet is is impossible to overemphasize the importance of this close air support to ground trcops. The history of World War II is replete with instances where ground commanders ascribe the success of an action to timely air attacks against critical targets directly opposing their advancing troops. To the doughboy caught in withering fire from a tank or emplaced weapon, the most heartening sight in the world was that of a P-51 or P-47 winging in to the attack.

While in terms of numbers of mis-

[redacted]

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

sions flown it may be necessary to concentrate greater effort on indirect support, there will be numerous occasions when the bulk of tactical (and even strategic) air forces should be thrown into direct support. This is particularly true during critical stages of an attack.

I can think of no better instance to illustrate my point than the familiar all-out air attack preceding the breakthrough by the first U.S. Army at St. Lo in the Normandy campaign. More than 2000 aircraft participated in this attack, directed at a target area extending for a depth of 3000 yards along an 8000-yard stretch of the St. Lo-Periers Highway. It was designed to break the crust on enemy defenses to insure a quick breakthrough of our ground forces.

The St. Lo Operation

Coordination measures were thought to be adequate, but artillery smoke used to mark the target drifted with the wind, and dust and smoke from exploding bombs obscured the target with the result that some of the bombs missed their mark. Nevertheless, the bombing had a telling effect on enemy defenses. Once launched, our ground-force attack pushed forward rapidly against disorganized resistance, breaking out of the narrow confines of the Cotentin Peninsula and sweeping southward. Thus, air support was of great assistance to the Northern force in the first critical phase of the sustained drive that carried our troops across France to the Siegfried Line.

This operation, while somewhat unlike the more common close-support mission, serves to illustrate the tremendous power of the air-ground team. At the same time, it points up to the difficulties of air-ground coordination, thereby emphasizing the need for well-defined procedures and extensive joint training for this type of operation.

More typical of the role of air power in close support of ground operations is the attack of specific targets involving only fighter-bombers, generally in small numbers. The target may be an enemy tank, an artillery or mortar emplacement, a fortification, an antitank gun, or even troop formations. While artillery or other ground weapons will be employed whenever possible, the advantages of aerial bombing, strafing or rocket attack can be visualized readily when the enemy target is carefully dug in, defiladed from view, or occupies a commanding terrain feature from which he can direct fire upon ground weapons employed against him.

This type of action is the ultimate in cooperative, coordinated joint action. It is the most difficult, and for that reason demands the most extensive joint training.

A Developed Idea

The air-ground team concept, as we know it today, is largely an end product of our World War II experiences. The team was employed with great success in later phases of the war, but during the earlier African campaign coordination did not approach the near-perfection we were later to achieve.

In Africa, whereas German planes seemed to pop out of the sky in a matter of minutes when an American vehicle exposed itself to view, the full potential of our own close-support was not realized. This was no fault of the Air or Ground Commanders concerned, nor did it show lack of foresight on the part of those re-

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

sponsible for training our Ground- and Air Forces. A system for coordination had been established, but it lacked the improvements that come in the light of combat experiences. Moreover, joint training in air-ground coordination had been extremely meager due to the limited availability of combat aircraft for training purposes

General McNair, the commander of the Army Ground Forces, whose responsibility it was to train all ground-force units before shipment overseas, sought at every opportunity to promote joint training exercises in which air-ground cooperation would be developed. He believed that close support should be emphasized in training because it was the hardest to learn. Lacking air force units with which to train, he directed that available liaison planes of the "grasshopper" type be used as substitutes for combat aircraft to add a note of realism to the training.

In operations involving tactical air forces in support of ground forces, we are dealing with two separate command structures engaged in a common effort. It is true that unified command rests with the theater commander, but, at the operating levels and the lower planning levels, each force is essentially an independent organization. Thus, coordination becomes the keynote of unified joint action. To overcome the inherent divergencies of this bilateral command structure, the closest liaison is necessary.

We learned a lot about air-ground coordination in the past war from the British in Africa and Italy. We also learned from the Germans—the hard way.

While I was Deputy Theater Commander in the Mediterranean, we worked out a highly effective system of coordination in the Fifth Army and the XII Tactical Air Force (similar in many ways to the British system), which later became the model for the entire European theater. Essentially the same system was used in the Pacific. That system was based on the closest possible coordination at the Army Headquarters—Tactical Air Force level.

This we obtained through an intimate relationship gained by locating the forward ground and air command posts within a few yards of each other. There they held nightly joint conferences to agree on the missions to be flown the next day. Also, a series of liaison officers assured close contact with lower army units and with supporting air units where they assisted in briefing pilots, posted bomb safety lines and exchanged information concerning operations of air and ground forces.

Another outstanding feature of the Fifth Army-XII TAF system, which has been subsequently adopted as a common procedure, was for the Air commander, or his representative, to go to the line of battle where,by radio communication with the attacking planes, he literally "talked them on to the target".

When the war in Europe ended, further improvements had been made in this coordination system and standardized methods had been adopted. But the impetus of every advance was invariably a more widespread understanding of the other fellow's problems, gained by constant daily association of the two forces.

Closer association was encouraged by interchange of personnel. For example, Air Force pilots were at-

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

tached to infantry regiments where they shared the hardships and hazards of the doughboy. When they returned, they had a better understanding of what the ground soldier expected of them and how they could give the kind of support needed. In the same manner, ground officers were attached to air units where they accompanied pilots on missions, thereby gaining a better appreciation of the airman's problems and his hazards in providing close tactical support.

In our training today it is important that we do not lose sight of these wartime experiences in the realm of the air-ground team. Furthermore, we must continually study the problems of the air-ground team, perfecting our methods and searching for better ones. Techniques of air control in indirect support missions may have reached an advanced state of perfection, but many of the problems of close support are solved only partially at present. From the ground commander's point of view, these problems are to provide:

1. A positive reliable method of communicating the location of friendly ground troops to the aircraft pilot.

2. An accurate method of marking the target or directing the pilot to the target.

3. The most direct means of communication between forward air controller on the ground and the aircraft pilot.

4. Reduction to a minimum of the time lapse between a request for an air mission and the execution of the mission.

5. Further development of aircraft for ground-support missions.

To minimize these problems, the Army must - and does - work closely with the Air Forces in planning and conducting training exercises. As Chief of the Army Field Forces at Fort Monroe, Va., I have a close relationship with the Tactical Air Command at Langley Field. Joint maneuvers and field exercise are planned on a joint basis. Since the war, we have had several such exercises, including SNOWDROP, ASSEMBLY, and the most recent one, EXERCISE TARHEEL. Under Air Force auspices, there also have been the highly valuable "Combine" exercises, conducted each year for the past three years. The latter, a joint Army-Navy-Air Force exercise, have been of inestimable value.

Joint exercises form a valuable part of our current training, but they do not go far enough. We need a joint organization to function on a continuous basis which, in addition to providing joint training, will act as an agency for developing joint air-ground doctrine, for perfecting existing coordinating systems, and for developing new methods in the field of air-ground support. The nucleus for such an organization has now been established at Fort Bragg and Pope Air Force Base, N.C. There the Air Force has organized a Tactical Air Force Headquarters which will operate in conjunction with V Army Corps Headquarters and other Army units, providing a vital coordinating link at the operating level.

Naturally, the Army also has an

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

interest in the military capabilities and performance of aircraft to be employed in future ground-support operations. We need a plane that can bomb, strafe or fire rockets on tanks, fortifications and other ground targets that may be opposing us. It must possess the ability to maneuver over the target or within a limited radius thereof. It must have flight characteristics such as to insure the pilot adequate time for target identification and for accurate delivery of fire. It must possess endurance time in the air in order to obtain the maximum duration of air-alert missions. It must be capable of operating from short, rough runways such as could be constructed quickly close to the supported ground troops. It must operate efficiently at altitudes of about 7000 ft. and below.

There are Disadvantages

I am fully aware that all of these characteristics cannot be met and at the same time provide maximum protection against attacking aircraft or hostile AAA fire. Certainly jet fighter-bombers will be better able to beat off attacking aircraft or evade hostile AAA fire. While the jets offer this and other advantages, they fall short of meeting the requirement for an ideal close-support aircraft. They stress high speed and maximum performance at high altitudes to the detriment of low-altitude performance and maneuverability. They require long prepared runways not likely to be available in the battle areas. Furthermore, their endurance time and armament do not equal those of conventional aircraft. These last-named deficiencies must be corrected.

It may be that a point has been reached in the development of fighter aircraft where the same craft can no longer be employed efficiently for the dual role of offensive aerial combat and close ground-support missions.

Although the comments here are limited to the Air Force and the Army, the same principles of coordination apply when the Navy and the Army team together. The Naval Air Force executes supporting missions in amphibious operations. This Naval air support is essential, both in the assault of the landing beach and during the advance of ground forces inland, until Air Force units are prepared to continue the support.

Joint operations came of age in the last war. They will dominate the scene even more completely in a future war, for, in looking forward, it seems probable that armies of the next war will need the tactical support of aircraft constantly, and as closely tied in to the action of front-line infantry and tanks as was the artillery of World War II.

Our efforts at present, then, are toward close harmony between the air and the Army to insure the coordination which adds "tactical air", as a member, to the infantry-tank-artillery team. Other factors being equal, that nation which achieves the most effective integration of its forces will win. We must insure the most effective military force by even greater cooperation and coordination.

Teamwork in battle won the past war; teamwork in preparedness will help to insure against the next war.

DEFENSE OF EUROPE WITH EUROPEAN ARMIES

GIOVANNI MESSE, ONE OF THE THREE LIVING ITALIAN MARSHALS, RECENTLY EMPHASIZED THE GREAT DISPARITY OF LAND AND AIR POWER AVAILABLE IN EUROPE TO THE EAST AND WEST. IN HIS ARTICLE MESSE POINTS OUT: IT IS EVIDENT THAT RUSSIA, AT THE MOMENT, CAN DO AS SHE PLEASES IN EUROPE, EXCEPT FOR THE RESTRAINING INFLUENCE OF THE ATOMIC BOMB. HE WARNS OF THE DANGER INHERENT IN THE "PSYCHOSIS OF WAR PREVENTION" AND ESTIMATES THAT ILL-CONSIDERED MOVES WILL NOT BE MADE BY EITHER SIDE AT THIS TIME. MESSE STRESSES THAT NOW IS THE TIME FOR THE ATLANTIC SYSTEM TO MAKE GREAT STRIDES TOWARD ESTABLISHING SECURITY. IN THIS, THE EUROPEAN NATIONS MUST PLAY THE PRIMARY ROLE.

It is not easy to write fully about such an important subject within the small space of one article. Staying within the limits of approximation and the caution of reservedness which such a summarized examination requires, we will however attempt to estimate the size of the minimum forces necessary to an Atlantic System which could be expected to intercept the threats it wishes to oppose. For an exact evaluation of the figures - very few to tell the truth - which we will have to cite, we shall say at once that it concerns data obtained for the greater part from the press, which in foreign countries (unfortunately it is not that way in Italy) offers as much as possible to illuminate and interest public opinion in these problems fundamental to the life of nations.

It is figured that Russia has today at its disposal 200 divisions ready for use, those of Russia proper and satellite countries, where the reconstruction of the military forces is taking place without worrying too much about the formal obligations of the respective peace treaties. More than half of these divisions may be considered to be available for the European front. A great part of these forces is armored, mechanized and motorized. The air force is very well developed in quality and quantity, especially for action in the tactical field; it is perhaps less formidable in the field of strategic action. In general, therefore, it is an imposing force, well commanded and able to meet, from any aspect, the requirements of modern warfare.

On this side of the iron curtain, in the occupied territories of Germany, Austria, and Trieste, we find a small number of allied divisions and military organization which, at the present stage, we may in general state to be undeveloped in the various countries associated with the Atlantic Pact (with exception of the few lucky ones which managed to keep out of the late conflict) or neutral. One must also add that the resources of some of these states (France, England, Holland) are largely engaged in expensive work of reorganization in far away overseas territories.

In order to set up a force of suitable size we may think of a complex of 25 to 30 divisions. The total value of these available forces is noticeably diminished by the heterogeneity of their construction, plus the lack of directing groups - indispensable for efficient teamwork. Some US divisions are available, organized in conformity with the lat-

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

est suggestions of military technique. At the present time, however, it is not intended to transfer them to Europe. If they were to be used, their number is not great enough to compensate the unbalanced forces on the continent.

Also the Air Force (we may limit ourselves to consider only the Anglo-American Air Force) is represented in Europe in very limited numbers, absolutely insufficient to face the overwhelming air force of the USSR. One must, however, keep in mind the important air bases which the United States has already established in England, where they keep heavy bomber squadrons which are to be feared. More could promptly arrive in case of need. Beyond the Atlantic the American strategic Air Force has a definite supremacy, entrusted above all to the apocalyptic threat of atomic bombing of which it believes to be able still to maintain the monopoly for some years.

The situation which results from these few data is very simple. Russia has today, a distinct predominance of the ground forces which would allow her to proceed at any moment to occupy the European continent with a relatively slight effort and in a relatively short time. The temptation to insure such a favorable position may be very strong and may become even irresistible, should Moscow be convinced of the inevitability of a conflict and, consequently, of the convenience of making the first move, before the new European armaments have reached appreciable strength. In brief one must fear the psychosis of the war of prevention which has already many times prepared the great wars of the past. On this temptation to make the first move, however, acts with just as much force the certainty that the predominant American Air Force is in a position if not to stop the operating armies, to make them pay with an exorbitant price such initial success. This may, however, reveal itself soon to be an absolutely transitory concept.

One may believe that in this tense field will not take place in the near future inconsiderate moves apt to disrupt the present situation of instable balance between the tremendous forces which influence it. Of this precarious truce the Atlantic System must take advantage without delay in order to reach a state of security more tranquillizing for all and less exposed to the changes of the moment.

While on one hand America will have to do everything possible to maintain and even increase the supremacy of its air potential, the European countries will have to proceed rapidly and in agreement, with material, technical and financial aid of the United States to the reconstruction of their military forces until they reach the consistence foreseen. This is necessary in order to be able initially to sustain alone the first clash of a probable agression. One must not underestimate the possibilities of these countries which constitute a block of over 150 million inhabitants; they have a very considerable industrial potentiality and can easily set up those hundred divisions which are necessary for the purpose.

The Chief of Staff of the United States, General Bradley, has authoritatively affirmed that America does not want to be called to liberate an invaded Europe but intends to make an invasion impossible by supplying the various states with the means to defend their borders. As far as Italy is concerned it is clear that this task can not be attended to with the few divisions which we have available and not even with the 12

divisions of which our Minister of Defense has spoken. Naturally, it is not the issue to bring up precise figures, which on the other hand, can only come forth from a profound examination of the requirements of our borders, our national resources and the allied concurrence both in military reconstruction and in case of a probable conflict.

Comments

This article by Giovanni Messe, one of Italy's three living Marshals, is an accurate and factual analysis of the precarious situation with which Europe in general and Italy in particular today is faced. The forceful factor about it is that it does not "gloss over" the hard facts of truth with which Italy is faced but brings them clearly in the open, as opposed to other current articles which have a tendency to lull their readers into a false realm of security, based on the Atlantic Pact and the Military Aid Program. Particularly significant is the author's warning against the "pschosis of war of prevention" which has led to great wars of the past. The overall importance of the article lies in its factual educational value to thousands of Italians.

WEAKNESS OF THE WEST

Compared with Russia's Land Forces, Western Europe's are small and ill-equipped.
Hanson W. Baldwin, The New York Times

The military weakness of Western Europe is the principal reason for the United States arms-aid program.

As compared to the great land forces of Russia and her very strong close-support air forces, the armed power of Western Europe is extremely small. Here are some of the figures measured in divisions, the yardstick of land armies:

FRANCE -Between five and six divisions in metropolitan France and Germany, with two more almost complete and others being formed. There are, in addition, between 100,000 and 150,000 troops in French Indo-China. About 100,000 troops in North Africa are organized, as yet, in units no larger than regiments, but will be organized in divisions. About five divisions are pretty well equipped, and one of these - with obsolescent tanks - is an armored division. Spare parts and automotive equipment are particularly short. France has very little air power, but has recently put into service one small unit of British jets.

ITALY -Has the equivalent of seven or eight divisions today; is aiming at cadres of eleven, which will be maximum permissible within the limits of the peace treaty. Divisions are poorly equipped, chiefly with obsolescent British wartime equipment and some American equipment. About 75,000 Carabinieri are rather well equipped with jeeps and light arms. Little air power.

BRITAIN - Has about the equivalent of two divisions, or slightly more, in Germany, and has less than one organized division in the British Isles in addition to various units of less than divisional size in other parts of the world. An armored brigade is in Germany. Equipment on the whole, is good. Air Force is strongly equipped with the best interceptor jet fighters in the world, but Britain is weak on modern bombers and has relatively little tactical or close support aviation.

BELGIUM - Her army's structure is built on a three-division basis, now all at cadre strength. Little air power.

NETHERLANDS - Army built on a three-divisional basis, but all three divisions are now in the Netherlands East Indies, with units no larger than brigades at home. Little air power at home.

NORWAY - A brigade is the largest unit. Very little equipment.

DENMARK - Two light divisions are planned, but equipment is scarce.

LUXEMBOURG - Two battalions.

PORTUGAL - Maintains about thirty-five regiments. Air strength consists of about 370 army and ninety naval planes - all obsolescent.

It is these weak and disparate forces that the Atlantic pact and arms-aid program are trying to weld into a strong and cohesive whole.

If the present military assistance program is endorsed by Congress, the

REGIMENTATION OF LABOR IN THE SATELLITE COUNTRIES

Although publicizing themselves as "workers' regimes," the Communist dominated countries of Eastern Europe in practice operate in a manner opposed to the interests of labor as traditionally understood by the labor movement. Bulgaria, Rumania, Czechoslovakia, Poland, Hungary, Yugoslavia and Albania have all adopted elements of the Soviet pattern of subjecting their working forces to a network of compulsions and restrictions.

As soon as the Communist leadership gained power in each of these countries, basic trade-union rights were swiftly denied. Under the power of the Communists, trade-unions have been transformed into an instrument for executing the directives of the government and consolidated into nation-wide "company unions." Instead of serving as a guardian of their members' interests, the trade union in the "people's democracies" devotes its main efforts to forcing increased production from each worker through the speed-up system and similar devices and to indoctrinating the workers in Communist ideology. With the trade-unions operating as an arm of government and with the latter the owner of the predominant portion of the country's industrial resources, collective bargaining in Eastern Europe is actually nonexistent. In matters concerning wages and working conditions, the government's policies are decisive. The right to strike, although not forbidden by law, has in effect been abolished in each of these countries. Without the effective right to strike or otherwise protect and improve their economic condition, these workers are actually working under conditions of involuntary servitude.

The freedom of the workers has been violated not only by the perversion of trade-unions into instruments of compulsion. For the very reason that the unions, permeated with Communists in key positions, no longer have the protection of their members' interests as their primary aim, the governments of the Soviet orbit have been able further to infringe on labor's rights through a variety of manpower controls. As there is some variation in the extent and intensity of these additional restrictions - limitation of labor mobility, forcing of "voluntary" contributions of labor to public projects, etc. - the situation in each of the satellite countries will be reviewed separately.

RUMANIA

By an order in Council of 4 July 1947, the Rumanian government made all labor subject to allocation by the Commission for the National Distribution of Manpower. This order provided the machinery, first, to purge all workers who have not fallen in line with the Communist ideology and, second, to draft by compulsion workers needed for understaffed industries.

A March 1949 decree further tightens the government's strict control over the entire field of labor. Pursuant to this decree, any individual who becomes unemployed for any reason is reduced to a position where in effect he must accept the

1452

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

particular job to which he is directed by the government.

The so-called "voluntary" contribution of labor to public works and other projects which has been promoted by the government is virtually indistinguishable from compulsory labor. Even where no evidences of direct coercion are present, social pressure is so strong and the known risks of noncompliance are so great that the ordinary individual must feel that he has no choice but to participate when called upon.

BULGARIA

By virtue of the Law for Labor-Economic Mobilization of 27 February 1948, Bulgaria has the power to draft any individual or group between the ages of 18 and 50 for economic or other work of state or public character.

Bulgaria is also following a planned campaign of increasing production through "voluntary", unpaid spare-time and overtime labor which by its intensity and method approaches compulsory labor. All inhabitants are now required to devote the equivalent of two months yearly to unpaid public work. Non-participants are exposed to discrimination and penalties as "unreliable elements". The spare-time "voluntary" work goes into local public works. The growth and extent of the spare-time brigade movement is suggested by the following official figures: In 1946, 24,212 brigades or 1,133,618 workers contributed 1,148,424 man days; during the first eight months of 1947, 4,430,000 brigaders worked 3,851,000 man days.

The youth labor brigade movement is a special form of "volunteer" unpaid labor. Theoretically a voluntary movement organized by youth organizations, the youth brigade has the earmarks of an officially sponsored and organized movement for supplementing the labor supply without cost and for the political-labor education of youth. The bulk of the work is done during the school summer vacation. High-pressured drives are made in schools to enroll or "draft" recruits.

HUNGARY

A decree of 6 April 1948 established a Hungarian cabinet committee to regulate the employment, transfer and dismissal of all personnel employed in nationalized and state-controlled and partly state-owned enterprizes. The implication of this decree may be gauged from the fact that at least three-fourths of all Hungarian workers are covered by the scope of this decree. The cabinet committee exercises its powers through the State Manpower Economy Committee (SMEC), which is an office of the Ministry of Construction and Public Works. The SMEC is empowered to dismiss or to transfer individual employees at the recommendation of the Communist-dominated plant committees and to determine wages and salaries to be paid to employees transferred to other jobs.

A series of decrees also establish the obligation of Hungarian citizens to perform public works. Work thus performed is compensated by the payment of wages determined by the government. It is known, however, that exemption from this type of labor may be obtained on payment of a monetary fee which is proportionate to the income or real estate owned.

CZECHOSLOVAKIA

The Czech government has a comprehensive decree authorizing broad manpower controls. Issued on 9 May 1947, it permits the national mobilization of labor in order to complete the country's two-year econo-

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

mic plan. The decree provides that, should mobilization on a voluntary plan fail, "the government would implement a compulsory program of transfers and recruitment". While the provisions of this labor decree have apparently not been widely applied, their mere existence acts as a deterrent to free action, since any attempt to transfer to a less essential job might have unpleasant consequences.

In order to obtain additional labor, Czechoslovakia, like other orbit countries, has resorted to the organization of "voluntary" work brigades. When organized on a nation-wide scale under the guise of national or victory shifts, "voluntary" work becomes virtually mandatory.

POLAND

Through various social and moral pressures, Polish labor is channeled into enterprises selected by the government. A specialist, for example, whose transfer is desired, would not be given employment elsewhere and so would have to go where he is directed.

Poland has also introduced national youth service under the name of "Service to Poland" which is obligatory on all youths from 16 to 21 years of age.

ALBANIA

In May 1947 a Directorate of Labor was createdand given sweeping powers for the mobilization of all Albanian workers. On 13 August 1947, the Albanian radio announced that the government had decided "to introduce forced labor,"adding that, according to this decision, "all the persons who served the former anti-people's regimes and who at present are jobless will be mobilized and employed in construction work". And again on 8 February 1948 Radio Tirana said that the Albanian government had recently issued an order providing for the employment of all able-bodied citizens between 16 and 50 who "as a result of idleness avoid work." The word "idleness" is, of course, subject to wide interpretation. Albania also makes extensive use of the so-called "voluntary"labor for unpaid, part-time service on public works projects."

With the disappearance of independent trade-unionism and the general regimentation of labor, all workers in the satellite countries are subject to varying degrees of compulsion, of involuntary labor. Moreover, forced labor, in the sense of assignment to hard labor in labor camps follows deprivation of liberty without formal judicial process, is encountered in these countries. For example on 25 October 1948, the Czechoslovak Parliament legalized compulsory labor camps for "work shirkers" and "disrupters". So loosely defined are the terms "work shirker" and "disrupter", and so sweeping the terms of the law, that it appears they may be applied to anyone whose political or economic views are not acceptable to the government. The so-called "labor-education" or concentration camps in Bulgaria are notorious. In existence from the beginning of the present regime,they have been kept supplied through such arbitrary and loose legislation as the Law for the Labor Mobilization of Idlers and Vagrants,the Law for Labor-Educational Communities for Politically Dangerous Persons, and the special powers granted the militia. These decrees have been directed to all sorts of nonconformists and have furnished the government with a supply of unpaid manpower for the hardest kinds of labor, especially in the coal mines.

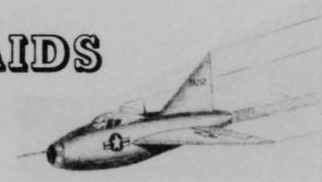
HOW DELTA-WING AIDS HIGH-SPEED FLIGHT



UNCONVENTIONAL PLANFORM COMBINES ADVANTAGES OF LOW ASPECT RATIO AND SWEEPBACK, BOTH REDUCING DRAG.

Although it is now more than four years since cessation of hostilities in Europe, U.S. and British aerodynamicists are still exploring a wide variety of ideas developed by German scientists during the war.

It is now apparent that since the beginning of 1944 researchers at German aeronautical laboratories were convinced that supersonic flight was practical. Accordingly by far the vast majority of their work from that time to V-E Day was concentrated on problems of highspeed flight.

DRAG REDUCTION STRESSED

By the end of the war the Germans had clearly defined these problems and proposed the basic solutions. In the missile field, at least, they had actually attained supersonic speeds and were well along with solutions for piloted supersonic flight.

Aside from obvious problems of providing suitable powerplants, major problems in the attainment of supersonic flight were reduction of drag and provision of lift. Because dynamic pressure at supersonic speed is so great, lift co-efficients need not be large, and this phase was laid aside in favor of the more serious difficulty of drag reduction.

DUAL ANSWER

They provided two solutions to this problem, both working equally well independently, and even better when used in combination—wing sweep and low aspect ratio. Efficiency of these two solutions is now well known. Not only have U.S. and British laboratories compiled extensive data on these planform configurations, but numerous craft are now flying using either or both.

The "delta-wing" combines both these solutions into a single planform to produce a triangle shape resembling the Greek letter A. Although it combines the two major ingredients of drag reduction, the delta-wing is useful only in the special case of very high speeds, since flight at lower speeds can be accommodated more practically by moderate sweep and aspect ratios.

MACH FACTOR

Generally, angle of sweep is determined by the maximum Mach number at which it is desired to fly without excessive drag, assuming, of course, adequate power. The faster the design speed of a projected plane design, the greater must be the sweep angle.

RESTRICTED

1455

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

For Mach 1.5, the sweep angle must be greater than 45 deg.; for M 2.0, sweep must be greater than 60 deg.

To obtain a low aspect ratio (3 or less) with a practical delta-wing, it is desirable that leading edge sweepback be 45 deg. or more. Hence, the delta-wing planform finds its most suitable range of application in aircraft operating at speeds greater than M 1.5, having leading edge sweepback greater than 45 deg. and aspect ratio less than 3.

HISTORY

The proposal for a delta-wing planform originated with Dr. Alexander Lippisch, well-known German scientist. He was long associated with Deutsches Forshungsanstitut fur Segelflug in the design of tailless gliders during the period of the armistice with Germany, which forbade powered aircraft.

During World War II, he was associated with Prof. Willy Messerschmitt in the design of the ME-163 Schwalbe rocket-powered fighter featuring sharply swept wings and no horizontal tail surfaces. Shortly after completing consulting work on this project he was made president of Luftfahrtforshung Wien, an aeronautical research laboratory near Vienna. Here he developed his ideas concerning supersonic aircraft design.

L-13a's DELTA-WING

Oddly enough, his studies on the subject came as a by-product of his paramount interest in the Lorin propulsive duct, or ramjet engine. When his propulsion investigation had passed the wind tunnel and flying model stage, Lippisch began design of a supersonic research plane to test his powerplant.

This project, the L-13a, had a delta-wing planform with leading edge swept back 60 deg. The ramjet engine was built integrally with the wing center section and was to be operated by refined coal.

WING'S FEATURES

The plane was to weigh 5060 lb., and had an estimated speed of 1020 mph. It incorporated a number of interesting design features including an elliptical airfoil section(to minimize transonic stability problems).

There was a gap of about three percent chord between wing trailing edge and control surfaces (to permit large control surface movement without the danger of reversal due to shock wave formation on the leading edge) and cooking air ducts between center section and outer wing panels to isolate the heat of the engine.

INITIAL TESTS

First, a model was tested in the Gottingen high-speed wind-tunnel up to Mach 2.6. These trials showed the design to have marginal stability at high speed and wholly insufficient stability at low speed.

Consequently, it was decided to build a glider version for stability investigations. This was designed by the Flugtechnische Fachgruppe Darmstadt and completed early in '44.

GLIDER NOT FLOWN

It was built of wood and fabric, and carried a pilot in the center section, his enclosure comprising the fin leading edge. It was to have been carried aloft on the back of a Siebel Si 204 light transport and released at 25,000 ft.

RESTRICTED

1456

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Small water tanks provided changes in trim and a rocket motor could be used for high-speed dive testing.

Tests were never made, however, and the glider was subsequently brought to this country.

FIRST DELTA-WING FLIES

The next delta-wing airplane(and first to fly)was not completed until four years later,but followed closely the general arrangement of the L-13a. The Convair Model 7002 made its first flight June 9, 1948 for a few miles at a height of only a few feet. Its first extensive flight was on Sept. 18, 1948. Both trials were at Muroc Air Force Base, Calif.

This design differs from the Lippisch in that it has a fuselage housing the pilot and powerplant, and a thin, air-foil-shaped wing. Test flights are continuing with the Model 7002, but results are not yet available.

Thus, the history of the delta-wing configuration is still meager-made up only of proposals and extensive wind tunnel tests in Germany and a few flights of a design built in the U. S. on the basis of these data, supplemented by wind tunnel tests at the Ames Aeronautical Laboratory of the National Advisory Committee for Aeronautics. But these data, together with greatly extended theoretical calculations, provide sufficient information on which to appraise this new and promising supersonic planform.

LIFT AND DRAG

In addition to low drag,the delta-wing exhibits the unique characteristic of immunity to lift coefficient changes with Mach number.

For example, the rectangular wing experiences a 20-percent increase in lift as Mach 1.0 is approached, an 80-percent increase as supersonic flow is established and a rapid deterioration of this lift with increasing Mach until it has dropped about 50 percent below its subsonic value at Mach 3.0.

In contrast, the delta-wing of low aspect ratio produces the same lift throughout this entire range from low subsonic to high supersonic speeds.

LIFT COMPARISONS

Despite this highly desirable characteristic, the lift coefficient of the delta-wing is considerably lower than that of a rectangular wing.

For example, from hydrodynamic theory, the lift coefficient of a conventional subsonic wing may be expressed: $C = 2a$, where a, the angle of attack, is expressed in radians. First approximation for a very slender delta-wing gives a value of the lift coefficient $C = Aa/2$, where A is aspect ratio.

Since this approximation is valid only for very small aspect ratios, at a ratio of 2 this equation will have a value of $C = a$, which is only half the value of the conventional subsonic wing, given above.

A further approximation is obtained by integrating the pressures over the upper and lower surfaces and this produces $C = 4a/1$. Inspection of this equation indicates that it is higher than the conventional wing only at low supersonic speeds (up to Mach 1.2) but grows progressively lower as Mach number is increased.

1457

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

DRAG ANALYSIS

The low drag of the delta-wing is its justification and is made up of conventional friction drag, wave drag and drag due to its production of lift.

In general, friction drag of the wing will be of the same magnitude as the thickness drag, one of the terms in the wave drag. In the absence of test data, its value is usually assumed at something less than 0.01, with a value of 0.006 being reasonable.

To this must be added the wave drag, which has been the subject of extensive theoretical study. The equation takes the same form of the lift coefficient plus the addition of thickness drag, mentioned above: $C_d = (4/\sqrt{M^2-1})(A^2 + t^2)$, where T is wing thickness divided by the chord. This may be rewritten as $C_d = aC_l + 4t^2/\sqrt{M^2-1}$, clearly isolating the drag due to the thickness ratio.

SUPERSONIC CONDITION

At subsonic speeds it is customary to divide the drag into two parts-a friction drag and an induced drag, the latter produced as a consequence of lift. At supersonic speed, drag due to production of lift can no longer be called "induced drag", since pressure changes in the trailing vertex cannot propagate forward and influence flow conditions.

The drag due to the lift at supersonic speed is a complex function which will not be repeated here, but it is proportional to the square of the lift coefficient.

Because drag of a delta-wing at supersonic speed is proportional to the square of the thickness ratio and the square of the lift coefficient, it would follow that low drag is obtained when both thickness ratio and the lift coefficient are low.

However, use of an extremely thin wing, poses, in addition to structural considerations, an interesting aerodynamic problem.

LEADING EDGE ACTION

Since the delta-wing leading edge is swept behind the Mach cone at moderate Mach numbers, an infinite velocity exists around the leading edge, the same as that assumed in satisfying the Kutta-Joukowski condition in subsonic flow.

If the leading edge is rounded, this infinite velocity is reduced to a large, but finite, value, pressure is reduced at the leading edge and a suction force is created. This suction causes the resultant force on the wing to be inclined forward relative to the chord plane, and the drag due to the lift is reduced proportionately.

Thus, a sharply pointed leading edge robs the delta-wing of this induced thrust. Requirements for extreme thinness are, therefore, in conflict with that for an adequately-rounded leading edge.

It is interesting to note however, that Lippisch used an extremely generous leading edge radius-of-curvature on his delta-wing glider, although it is not known whether he had discovered the mathematical reasons for such a configuration at the time.

STABILITY AND CONTROL

It is now well known that the slope of the lift curve is reduced by reductions in aspect ratio and by increases in sweep angle. This indi-

1458

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

cates, of course, that the angle of attack required to obtain a given lift coefficient is increased proportionately.

Delta-wing airplanes, then, require very high altitudes for landing and takeoff within distances comparable to those for conventional aircraft.

These altitudes need not be used when sufficient runway is available for the takeoff and, because of other considerations to be shown, power may, and probably will, be used in landing delta-wing aircraft to reduce the altitude for touchdown and provide sufficient energy for the flare.

STABILITY CONSIDERATIONS

In general, the delta-wing pitching moment is stable so long as its aspect ratio is held quite low. This requires that a 45-deg.-swept delta-wing have an aspect ratio not greater than 3 and a 60-deg. design an aspect ratio not much more than 1.

This stability holds true up to the stall, although experimental data are in conflict in the region of the stall. At this point, the low damping in roll of the delta-wing becomes a vital consideration and some model tests indicate actual autoration at the stall due to this characteristic.

Other tests indicate marginal longitudinal stability at the stall, particularly for extremely high degrees of sweep.

One of the difficulties of predicting low-speed derivities for delta-wings is the unpredictable effects of flow separations at high angles of attack required for the stall. These angles may often have values as high as 40 deg.

LOW-SPEED DATA

Some interesting results of low-speed tests of delta-wing planforms are available from captured German reports of work done at DVL.

These data show a strong lateral flow development over the rear of the wing moving towards the tips. Since this flow results in low pressures, lift is increased.

This increase in lift at high angles of attack produces a peculiar concave discontinuity in the lift curve and the slope actually begins to increase from $C_l = 0.4$ on up.

This flow also produces a rearward shift in the neutral point, the lift coefficient at which this shift begins decreasing with decreasing aspect ratio and increasing sweep angle.

A further result of this flow is a paradoxical increase in $C_{l_{max}}$ with decrease in aspect ratio.

NACA RESULTS

Although extensive test data on delta-wing planforms has now been compiled by NACA, the only unclassified results available contain data on a model having 63.4 deg. sweepback on the leading edge, aspect ratio of 2 and an NACA 0012 airfoil, the same section used by the Germans in their tests, previously outlined.

These data show a maximum lift coefficient of 1.7 at an angle of attack of 35 deg. But of major interest is that this lift coefficient was attained at a point about 40 percent of the semi-span outboard of the longitudinal centerline. Maximum lift coefficient attained at the centerline was only 1.05 at an angle of attack of 48 deg. This illust-

1459

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

rates one of the important practical characteristics of the delta-wing, its wide variation in span load distribution with angle of attack at low speeds.

In these tests, maximum span loading coefficient moved outboard from the centerline (at 4.3 deg.) to a point 60 percent of the semi-span at 22.7 deg. and then moved back inboard again to the centerline at the stall.

Center-of-pressure moved inboard with angle-of-attack from 42 1/2 percent semi-span at zero deg. to 30 percent semi-span at 48 deg.

Throughout these tests, however, the wing center-of-pressure remained constant longitudinally at about the 40 percent mean aerodynamic chord location.

TIP STALL

These data indicate that despite earlier optimism, the delta-wing is subject to the tip-stall propensity which a cursory examination of the planform would suggest, since its spanwise lift distribution is theoretically infinite along the leading edge and sinks to a very low value along the centerline.

This theoretical distribution is only modified slightly in practice (since infinite velocities are reduced to high but finite values), resulting in the planform stalling at the tips first and this, coupled with the low damping in roll, combines to create serious low-speed stability problems which will undoubtedly require high-power landings, mentioned previously.

REYNOLDS NUMBER DATA

Further doubts concerning the low-speed stability of delta-wing planforms are expressed on the basis of adverse Reynolds number effects. An NACA study of captured German reports together with Allied and U.S. data indicate that although at low Reynolds numbers higher maximum lift coefficients were obtained for moderately swept-back wings than for unswept wings of similar planform, at high Reynolds numbers, however, increasing the sweepback decreased the maximum lift coefficients. The study showed this effect particularly marked for delta-wing planforms.

It was on the basis of these indications that the decision was made by the Air Force and Convair to delay the final design of the XF-92 until a flying scale model, the 7002, could be built and tested to provide high Reynolds number data.

CONTROL SURFACES

Problem of the location and planform of control surfaces on a delta-wing has undergone extensive theoretical and experimental study, but much remains to be done.

Use of delta-shaped control surfaces at the tips of the wing shows promise with one theoretical study indicating that for the same ratio of control surface chord to wing root chord, the triangular surface produced a rate-of-roll per hinge moment coefficient twice that of a two-dimensional case.

For the case of conventional full-span, constant-chord control, the results are not yet clear. Although the study indicated that the lift produced by a unit control deflection was actually greater than the lift resulting from a unit angle of attack of the entire wing, this is probably a result of the low lift curve slope of the wing, previously described, rather than control effectiveness.

1460

THIS PAGE IS UNCLASSIFIED

For the case of partial-span surfaces, either inboard or outboard, the variation of their effectiveness with Mach number leaves little to choose between the two, although the study indicates that high aspect ratio control surfaces have the same superior characteristics at supersonic speed as do those at subsonic speed.

One of the interesting possibilities of providing camber and twist to a delta-wing to support specified lift distributions at supersonic speeds is the use of a gull-wing design, which was first revealed at the 1949 Inspection of the NACA Langley Aeronautical Laboratory.

Whereas the flat-surfaced delta-wing has a U-shaped lift distribution when viewed in the plane of the wing, a flat distribution can be given by arching the plane of the wing upward and outward from the centerline. Various degrees of arch can be used to provide any required lift distribution. While these offer interesting theoretical possibilities, structural considerations make them impractical at this time.

Aviation Week 4 Jul 49 Uncl

Continued from Page 9

first year's results will mean internal security and a great psychological "shot-in-the-arm" for Western Europe, and at the end of a year or eighteen months Western Europe should have, in addition, to seven or eight fairly well equipped Italian divisions, about twelve divisions pretty well equipped, plus supporting tactical air forces. What the eventual size of the armed force will be is anyone's guess today, for the ultimate goal has not yet been planned, but it will probably be between forty and sixty divisions, closer to forty than to sixty.

Most of the equipment that is tabbed for transfer to Europe in the first year is for land forces, but there is some air equipment. Britain is assuming the responsibility of equipping the Continental air forces with her jet Vampire and Meteor fighters. We expect to transfer to Britain 100 B-29 bombers, which are now considered intermediate range bombers, primarily useful for tactical purposes.

Gen. Hoyt S. Vandenberg already has announced that the two groups of United States fighters in Germany will henceforth be completely jet-equipped. One group already is flying jets; the other, which has been flying F-47 Thunderbolts - a type very useful for ground support work - will turn over about 100 of these planes to France. France will also get some obsolescent Douglas navy dive-bombers for use on her aircraft carriers.

THE BOOK SHELF

RECOMMENDED READING FOR YOUR OFF DUTY HOURS

TITLE: Three-Jet XB-51 Shows Unusual Design

SOURCE: Avia. Week 3 Oct '49 (51-14 Wkly);pp 12-13; illus.

ADDRESS: Aviation Week
McGraw-Hill Publishing Co.
330 West 42nd Street
New York 18, N. Y.

The most unconventional jet-aircraft design yet produced in the U.S. is the new three-jet XB-51 ground-co-operation fighter-bomber announced by Glenn L. Martin Co. A variable-incidence wing on the XB-51 and the uncommon position of two of its three turbojet power plants, mounted on pylons extending from the fuselage, together with the sweepback of wing and tail surfaces give the craft a radically different appearance. Placement of the stabilizer at the top of the tailfin and the tandem main landing gear, which retracts into the fuselage, add to the strangeness of the design. The basic advantage of variable-incidence over fixed-incidence design on the XB-51 is explained. The XB-51 wing features the use of spoilers for lateral control. Stabilizer location atop the fin avoids jet and wing turbulence at slow speeds and guarantees maximum longitudinal control.

TITLE: X 4 Germany's Smallest Liquid Rocket

AUTHOR: H. Gartmann

SOURCE: Interavia Sep '49(Mthly); pp 553-555; illus.

ADDRESS: Interavia S. A.
Corraterie 6
Geneve 11, Switzerland

German war-time rocket developments included an extremely small liquid-propellant rocket engine. The Bayerische Motorenwerke furnished this small engine for the X-4 missile. The first serial models had a thrust duration of 22 sec, a maximum thrust of 140 kg, and the fueled engine weighed a total of 22.5 kg. Other operational data on the first test models and the first serial models are given. Since it could not be used more than once, the construction had to be as simple and the manufacturing costs as low as possible. In the main, this engine consisted of a combustion chamber, two spiral pipes serving as propellant tanks, a compressed-air container composed of two separate tanks, two valves for the air container, and a few accessories. The functions of the component parts are described, and available operational data and developmental data are discussed.

AIR FORCE LETTER)
NO. 205-25)

DEPARTMENT OF THE AIR FORCE
WASHINGTON, 30 MARCH 1949

SECURITY

Disclosure of Classified Information to Reserve Forces Personnel

(Effective until 30 September 1950 unless sooner rescinded or superseded.)

	Paragraph
Purpose	1
Scope	2
Policy	3
Investigation and Clearance	4
Residents of Foreign Countries and Foreign Nationals	5
Requirements	6

1. Purpose. To provide uniformity, this Letter outlines the policy of the Air Force with respect to the dissemination of classified military information to Reserve Forces personnel.

2. Scope. This Letter applies to the Air Force Reserve and the Air National Guard, and in addition, its provisions will be followed in connection with activities concerning the Air Reserve Officers' Training Corps and the Senior Division of the Civil Air Patrol. This Letter does not apply, however, to personnel on extended active duty.

3. Policy. In compliance with the provisions of AFR 205-1 regarding security of military information, Reserve Forces personnel may be entrusted with classified information as follows:

a. RESTRICTED information may be disseminated for official military purposes to any Reserve Forces personnel.

b. Except as authorized in c below, information classified no higher than CONFIDENTIAL may be disclosed to Reserve Forces personnel not on active duty who are actively participating in official training activities, provided that possession of the information is essential to the training course or program.

c. SECRET information may be disclosed to Reserve Forces personnel on active duty for training purposes and personnel not on active duty who have a mobilization assignment, provided that possession of the information is necessary in the performance of official assigned duties.

d. TOP SECRET material will not be used for training purposes in connection with Reserve Forces training programs. As authorized by paragraph 7, AFR 205-1, 14 March 1949, however, individuals serving on short periods of active duty whose assignments require it may be given access to the TOP SECRET information essential for the performance of their assigned duties.

e. Documents containing information classified higher than RESTRICTED will not be disseminated for retention by individuals. Such documents will be stored in military files only.

f. Reserve Forces personnel not on active duty who receive classified information will be informed that the information affects the National defense of the United States within the meaning of the Espionage Laws and that its revelation or transmission to an unauthorized person is prohibited.

g. Upon termination of active duty training, personnel will be briefed on the necessity for maintaining security of their professional knowledge while on inactive status.

4. Investigation and Clearance. Commanders concerned are responsible for requesting personnel security investigations and clearing personnel referred to in this Letter whenever required or necessary in accordance with separate Regulations.

5. Residents of Foreign Countries and Foreign Nationals. The provisions of AFL 182-4 and 8f, AFR 205-1, 14 March 1949, will be observed regarding dissemination of military information to persons residing in foreign countries, or to foreign nationals as defined in paragraph 2i, AFR 205-1.

6. Requirements. Although it is the desire of the Air Force to make available to Reserve Forces personnel such classified information as is required for training purposes within established training programs and courses, it is of primary concern that no breach of security will result from this policy. Commanders concerned will review continuously all classified material required by or of direct value to Reserve Forces activities, and whenever appropriate, will initiate down-grading action thereon in accordance with paragraph 27, AFR 205-1, 14 March 1949.

BY ORDER OF THE SECRETARY OF THE AIR FORCE:

- - - - - -

*This Letter supersedes AFL 205-25 (formerly 46-7), 31 March 1948.
This Letter has been coordinated with and approved by the Chief, National Guard Bureau, as being applicable to the Air National Guard.

MAPS AND DIAGRAMS

This is the XXIV and final chapter of a series extracted from the handbook for intelligence officers entitled "Air Intelligence Handbook", ConAC, classified Restricted. The book in its completed form will be disseminated to each regular and reserve unit in sufficient copies to:

a. Enable the intelligence officers of the TO&E units of the reserve forces assigned to this command to achieve the standards of training established by ConAC Training Standard 45-2.

b. Assist the training officers of Intelligence Volunteer Air Reserve Training Units in implementing their individual unit training programs.

c. Assist intelligence officers of regular Air Force TO&E units in the implementation of ConAC Training Standard 45-1.

(Distribution of the handbook to units of this command will be accomplished by ConAC Air Forces.)

SCOPE

This Chapter assumes the intelligence officer's knowledge of the basic principles and practice of military mapping and map reading (as outlined in FM's 21-25, 21-26, 21-30 and 30-22), and discusses only special maps and diagrams whose preparation and maintenance are peculiar to intelligence. The more common types of graphic representations prepared by intelligence sections are:

a. Situation Map.

b. Theater Map.

c. Enemy Air Order of Battle.

d. Geographic Flak and Enemy Defense Map.

e. Flak Diagrams.

f. Bomb Impact Plots.

g. Track Charts.

1. Air Combat.

2. Proposed Route.

h. Target Charts and Strips.

SITUATION MAPS

Situation maps portray enemy, friendly, or enemy and friendly, operations and positions at a specific time. In ground units, a map showing enemy positions is known as an intelligence situation map; showing friendly positions, it is known as an operations situation map. In air units a combined, or joint operations-intelligence, situation map is recommended because intelligence is required to have knowledge of both friendly and enemy situation. Usually information is posted on an overlay so that changes can be made quickly, and the map maintained constantly up to date.

The overlay should never be cluttered with material that will obscure the basic information, or with

1466

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

data already available on the underlying map.

Any transparent hard-surfaced material, such as tracing paper, tracing cloth, vellum, cellophane, plasticele, plexiglass or cellulose acetate can be used for an overlay. Depending on the surface of the overlay material, markings can be made with colored inks. (Camera film with the emulsion washed off in warm water, with sodium carbonate added to aid in the removal, makes a satisfactory substitute for plasticele. The film should be so overlapped that grease pencil rubbings will not work through to the map surface).

Where overlays are not used, postings may be made directly on the basic map; using cardboard, pushpins and flags as symbols. Some situation maps, particularly in antisubmarine units, are laid over an iron sheet and magnetized metal markers are placed at will on the surface.

To facilitate the measuring of distances, handy map scales made in the form of wooden rulers can be hung near the appropriate maps.

The usual information posted on a situation map is presented in the "shorthand" form of military symbols, prescribed in FM 21-30. Every item posted should be dated.

THEATER MAPS

A theater map is a display or "Current events" map. An effective theater map is shown in this chapter, where typed information relating to events at specific points is posted around the border of the map and connected to the points by yarn or pencil markings. Aerial photographs, detail maps, statistical tables, news clippings, etc., are used to add interest to the display.

ENEMY AIR ORDER OF BATTLE

Enemy Air Order of Battle is most effectively represented in map form. The example given shows how to keep such a map with push-pins to indicate enemy air units. Different shapes, colors and markings on pins can be used to distinguish type and strength of units represented. In advanced field conditions, data is best marked by grease pencil on an overlay.

FLAK AND ENEMY DEFENSE MAPS

Flak and enemy defense maps show the location and type of anti-aircraft weapons, searchlights, balloon barrages, etc. Locations may be indicated with pins, flags, or markings on an overlay or on the map itself.

A geographic flak map shows by means of circles and variety of colors the enemy anti-aircraft defenses of an area, indicating location, type, density and ranges of guns.

FLAK DIAGRAMS

While a flak map shows the location of enemy anti-aircraft guns, a flak diagram is a representation of the volume of probable fire at a given altitude over a specified target. Density of fire is often illustrated by the use of light-colored circular discs to show the field of fire. These can be printed on a chart, or made of translucent plastic material and hung on pins which indicate gun positions. The varying density of color, resulting from the overlapping of the discs, is a gauge of the intensity of fire. The more accurate clock density charts showing the number of units of fire to be expected along the different ra-

1467

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

dii or headings from a target can be used to show the paths in and out which are most free of flak.

COMPOSITE MAPS

At times, especially when the unit is moving rapidly, a single map presenting all information may be preferable.

BOMB IMPACT PLOTS

A bomb impact plot is an annotated print which shows the location of each bomb impact in the target area. These plots are made by using every photograph taken by the attacking aircraft during any one mission. With the aid of a stereoscope all bursts visible on the photograph are plotted on the bomb impact overlay or photograph. A report stating what areas or buildings appear to have been hit always accompanies the Bomb Impact Plot.

TRACK CHARTS

There are two types of track charts: Air combat and route. Track charts of air combat locate attacks by enemy aircraft and anti-aircraft artillery on the track made by our aircraft. Track charts of routes show the routes proposed for each mission and those actually flown by each aircraft or group of aircraft. Information necessary for the preparation of both these charts is obtained through interrogation, navigators logs and photographs of enemy aircraft.

TARGET CHARTS AND STRIPS

Target charts and strips are described in Chapter XVIII. Usually they are available to intelligence from higher echelons; if not, intelligence can prepare substitutes by drawing concentric circles at one-mile intervals on a map of the target area.

CHAPTER QUIZ

1. What is a situation map?

2. What is a theater map?

3. Discuss flak and enemy defense maps.

4. What is a bomb impact plot?

5. What are target charts and strips?

AIR FORCE REGULATION NO. 100-28)

DEPARTMENT OF THE AIR FORCE
WASHINGTON, 11 NOVEMBER 1949

COMMUNICATIONS

Classification of Ground Radar Sets by Slant Range

Paragraph

General 1
Definitions 2

1. General. By action of the Joint Communications-Electronics Committee (Joint Communications Board) on 25 February 1949, the following definitions were adopted for the classification of ground radar sets by slant range. These definitions will be utilized for all inter- and intra-service purposes.

2. Definitions.

a. VLR (Very Long Range) - Equipment whose maximum range on a reflecting target of one square meter normal to the signal path exceeds 400 miles, provided line-of-sight exists between the target and the radar.

b. LR (Long Range) - Equipment whose maximum range on a reflecting target of one square meter normal to the signal path exceeds 300 miles, but is less than 400 miles, provided line-of-sight exists between the target and the radar.

c. MR (Medium Range) - Equipment whose maximum range on a reflecting target of one square meter normal to the signal path exceeds 150 miles, but is less than 300 miles, provided line-of-sight exists between the target and the radar.

d. SR (Short Range) - Equipment whose maximum range on a reflecting target of one square meter normal to the signal path exceeds 50 miles, but is less than 150 miles, provided line-of-sight exists between the target and the radar.

e. VSR (Very Short Range) - Equipment whose range on a reflecting target of one square meter normal to the signal path is less than 50 miles, provided line-of-sight exists between the target and the radar.

BY ORDER OF THE SECRETARY OF THE AIR FORCE:

HOYT S. VANDENBERG
Chief of Staff, United States Air Force

*This Regulation supersedes AFL 100-19, 30 March 1948.

POLAR GUIDE

This is the fourth of a series of articles on Arctic Indoctrination

Chapter 8 --- Medical Problems

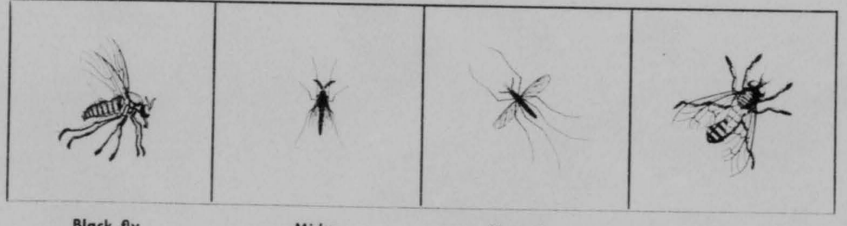
INSECTS

In the polar regions, the word "flies" has a special meaning. It refers not to house flies, blue bottle flies, and other such relatively inoffensive and friendly creatures, but to insect pests that come after a man in savage hordes, usually two or three kinds at once, intent on drinking his blood. "Flies" includs mosquitoes, black flies, deer flies, and midges. Flies have been called the curse, the bane, and the scourge of the polar summer. That they deserve this description will be readily admitted by all who have spent part of June, July or August in the north woods or on the tundra. They are the foe of both man and beast. During the long bright days, when twilight hours are few, they know no rest. Always on the lookout for a meal of warm blood, they swarm about their victims, centering their attack upon exposed skin or places where the hair is thinnest. There they alight, probe, and bite away until a hand slaps them, a strong wind blows them off, or a chill rain disposes of them. Only with the end of summer does their onslaught stop. Mention flies to a seasoned North countryman, and he will give a special scowl as he adds his bit to the opinion that has piled up through the years. "Why, I've had flies on me so thick, that you couldn't tell the color of my clothes", he begins and he's off. By the time he's finished, you wonder what he means when he speaks of loving the polar regions.

Description

Mosquitoes - These need no description — you'll know them.

Black Flies - These are small, black stout-bodied, hump-backed flies, sometimes called buffalo gnats or (erroneously) sandflies. Their bites stay open and continue to bleed for some time. They attach themselves especially at the collar line and inside the clothing where the belt binds the waist. They are less abundant north of the tree limit than south of it.



Black fly. Midge. Mosquito. Deer fly.

1469

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Deer Flies - These are large, strong-flying pests with banded wings. They bite ferociously the instant they alight on the bare skin and on hot days they follow a person persistently, even in a stiff wind. There are several kinds and their names vary locally. They are also known as gadflies. Other flies in the same family are moose flies. These are larger, socty black flies also called horseflies or bulldogs. The last term is peculiarly apt in view of their tenacity and the size of the hole they drill in the skin.

Midges - These are minute flies about one twenty-fifth of an inch long, known as "no-see-ums", "punkies", "gnats", and even "creepin' fire". They sink their tiny biting mouth parts into the skin, causing a sharp, burning pain all out of proportion of their size. Some of them are about the color of human skin and are very hard to see on the arm or hand.

Characteristics

Mosquitoes, black flies, deer flies, and midges don't resemble each other in general appearance, but they are alike in several significant ways. They all bite— that is, they do not sting, as bees and wasps do. They do not generally carry diseases. They are primarily daytime insects. In more southerly regions, mosquitoes may not come out in numbers until evening, but in the Far Norththey seem to prefer daytime, especially the afternoon. If it turns cold, they become inactive, even when they are abundant. Only the females bite. (This is an interesting fact from which you may derive a dubious comfort). During their larval stage, they live in water. All these pests have their natural enemies. As adults, some are captured occasionally by birds, spiders, and such predatory insects as dragon flies. As larvae, some are eaten by birds, small fish, and certain aquatic insects. As eggs and as pupae, they are fairly safe from molestation because they are motionless.

How Flies Attack

Each of the fly families has its own method, manner and time of attack. They exhibit the following attack characteristics.

Mosquitoes are not bothersome on cold nights, but the coolest summer nights are so short in the polar regions that they furnish only brief periods of respite. Mosquitoes are discouraged by a strong wind, however, so if you can stay near the coast, or on a peninsula, where there is a sea breeze, you may remain comparatively free of the pests. The worst days are the warm, quiet ones with a gentle land breeze. Then, for hours at a stretch, the unrelenting attack continues, especially in the afternoon. While the mosquitoes seem to prefer dark places, and will settle on dark clothing in preference to light, they do not seem to mind the direct sunlight.

Black flies prefer hot, sunny, dry days and are especially bothersome in June and July. They become quiet in cool weather and are never troublesome at night. Unlike mosquitoes, which usually fly from one point of attack to another, black flies run nimbly about like tiny bees, looking for openings in the clothing. When they get inside a man's shirt they gather at the waist in a greedy row or crawl down to the boot-tops. By evening, it is not uncommon to find your middle encircled with a row of open bites to which blood-stained underclothing sticks. If you have no head-net, black flies will attack the collar-line savagely. A hand-

1470

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

kerchief will afford slight relief.

Deer flies and mooseflies are lovers of sunlight, warmth, and moisture. Cool weather discourages them, and they are not as annoying on cloudy days or after sunset. But they can be very bothersome even in windy weather as long as the day is warm and bright. They will follow mile after mile, flying in the shelter of your head, winging round and round, striking your face, especially about the eyes. Their bites swell considerably.

Midges are irregular in distribution, but locally they can be terrible pests. They bite chiefly in the evening and early in the morning, and may be very bothersome on cloudy sultry days. They are quickly dispelled by cold weather.

Protective Measures

It is one thing to slap a mosquito now and then on a warm summer evening in Ohio — but quite another thing to run from a cloud of polar mosquitoes and black flies so thick a man can scarcely see through them. Don't be foolhardy enough to think that you're tough enough to get along without a headnet. You owe it to yourself, and to the work you must accomplish, to avoid bites, the danger of infection from scratching, and the wear and tear on your nerves by making certain that a good headnet and gauntlet gloves are part of your equipment.

Headnets - Headnets must stand out from the face so that they do not touch the skin. It is most practical to wear them over a fatigue hat. You can sew them to the brim of your hat or attach them with an elastic band that fits around the crown. They should be made of the best grade of fine-meshed bobbinet (at least 18 meshes to the inch). Ordinary mosquito netting is not suitable for headnets, because it is not tough enough. Black is the best color, for you can see through black more easily than through green or white. At the bottom, there should be a strip of tough cloth encasing a drawstring, for tying snugly at the collar. Hoops of whalebone or ratten, or a broad coil of lightweight flat steel wire fastened on the inside, will make the net stand out from the face and at the same time allow it to be packed flat. Headnets are hot and disagreeable at best. The larger they are, the better the ventilation. But very large nets will not do for wooded country

PROTECT YOURSELF

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

where they may become snagged on brush. Some nets are provided in front with a celluloid window. Others have a special opening for a pipe. The most durable and airy ones are made of wire screen, with cloth and draw-strings at the bottom.

Gloves - Gloves are hot, but are a necessity where flies are really numerous. Old kid gloves with a 6-inch gauntlet closing the gap at the wrist, and ending with an elastic band halfway to the elbow, are best. For fine work, kid gloves with the fingers cut off are good. This requires a liberal use of fly dope on your fingers. Cotton work-gloves are better than no protection at all, but mosquitoes will bite through them. Treating the gloves with a creolin solution will help.

Clothing -It is well to bear in mind that mosquitoes do not often succeed in biting through two layers of cloth; hence, a lightweight undershirt and long underwear will help. To protect your ankles, tuck the bottoms of your trousers into your boots,or wear some sort of leggings. Tests show that light-colored clothing is better than dark. Navy blue, red, or black are apparently more attractive to mosquitoes, perhaps because they make the pests almost invisible to their enemies or because darker colors have greater capacity to absorb heat. The white camouflage or suntan clothing now issued by the Air Force is one form of protection against flies. Tan-colored socks offer less likelihood of ankle bites than dark socks. If you lose your headnet, make the best of a bad situation by wearing sun glasses with screened sides, plugging your ears lightly with cotton, and tying a handkerchief around your neck.

It is a good idea to spray your clothing with aerosol insecticide at night — it will help a lot to keep out no-see-ums during the day when you are working.

Fly Repellents - Fly dope will help keep the pests away. One of the best new preparations is dimethylphthalate, now being used by the Air Force. It gives good protection for a little less than two hours after application, even when you perspire liberally. Various other mixtures have been used from time immemorial. Many a fisherman, woodsman, and explorer has evolved his own favorite recipe. Many home-made preparations can be used when a regular repellent is not at hand. Those containing oil of tar are the most effective.

Tents - Tents should have a complete cheesecloth lining or bobbinet curtains at the front if they are to provide real comfort. Ordinary mosquito netting is not satisfactory. Cheesecloth with a circular or oval opening that can be closed with drawstrings may be sewn into the front of the tent. A bobbinet curtain, weighted with shot at the bottom so that it will hang to the ground serves the same purpose. To by flyproof, the tent must have a complete cloth floor, or a foot-wide cloth extension, which may be held down with sod, extending inward from each wall. A tarpaulin laid over this extension makes an extra-tight floor. There must not be the slightest rip or hole in the tent, as mosquitoes quickly find openings of this sort. Before entering, brush the flies vigorously from the front of the tent and from your clothing.

Beds - Make the beds flyproof if the tent is not. Bobbinet is best. Make certain that the net will be held away from the face and body of the sleeping person (nets should be

1472

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

held from the sides of the bed). A net covering the whole bed or sleeping bag is more satisfactory than one covering the head only.

To keep no-see-ums out of the bed nets during the day, spray the nets with aerosol insecticide and put them in an air-tight bag. Spray the beds and nets at night again, for no-see-ums can get through the nets.

Smudges - Smudges when properly made will furnish relief for a short period. For a good smudge, clear away all debris and humus down to the mineral soil to prevent ground fire and build up a brisk blaze of dead wood. Let this burn until a bed of coals is formed. Meanwhile, gather a supply of additional fuel as well as a mass of green ferns, leaves, twigs, damp leaf mold, and rotten wood. Place new dry wood on the coals and allow it to burn up brightly, then cover the whole fire with part of the green material. The dense smoke that now arises will banish the black flies instantly and repel most of the mosquitoes.

Built in a pail or pot, a bucket smudge is very useful since it can be moved easily in case the wind changes, or can be taken inside a tent until the flies are driven out. Put about two inches of sand in the pail before starting the fire. When you take a bucket smudge inside, be very careful to prevent setting the tent on fire.

Of course, if you are not an expert on smudges, they will probably run you out of the tent faster than the flies. Moreover, they constitute a fire hazard. Consequently, the best method is an aerosol insecticide bomb.

Spraying - Fumigation is a means of killing flies. Burning powdered jimson weed in a tent will stupefy mosquitoes without injuring human beings. The jimson weed is most effective when 8 ounces of it, mixed with 2 1/2 ounces of saltpeter to facilitate burning, is allowed for every 1,000 cubic feet of tent interior. Commercial fly spray is also good. Be careful not to strike a light after spraying a room, since an explosion may occur.

The most convenient lethal spray for use indoors is the aerosol insecticide dispenser. Operation for a few seconds is sufficient to kill all mosquitoes in a pyramidal tent, and one dispenser will suffice for 200,000 cubic feet. This spray is non-inflammable and will not harm human beings.

Food - Keep all food covered, especially meat, as long as insects are prevalent, and don't be too hasty in stopping these precautions. It is surprising how late in the fall insects are around.

Treatment of Fly Bites

Soaking in soapy water is the easiest and best all-round treatment of fly bites. You may use cold wet compresses made with baking soda, ammonia, glycerine, alcohol, iodine, moist soap, and even naphthalene moth balls. You can relieve the itching with calamine lotion.

As has been previously pointed out, black fly bites may stay open and continue to bleed for some time. There is, consequently, real danger of infection, especially from scratching. Occasionally, on a hot day at the height of the black fly season, a badly bitten neck will swell noticeably. Careful bathing in cold water, plus application of a wet compress will reduce this inflammation.

Fly Control Measures

Can these flies be exterminated? The answer is — No — not in the polar regions; these regions are too vast. There is too much shallow water and other favorable breeding places. You may cut down the local abundance of black flies slightly by keeping streams free from obstruction and spraying DDT by plane. The larvae cling to rocks, roots, and fallen branches which accumulate at riffles. However, black flies breed only in swiftly flowing streams; avoid camping near them in black fly season. On the tundra, where innumerable ponds meet the eye in all directions, the situation is hopeless with regard to mosquitoes. Here, there is actually more water-surface than land surface. Most of the water is ideal for mosquitoes, for it warms up promptly in the spring. For every pool you can cover with oil there are a thousand you can't see. For every wriggler you can destroy, ten million will survive. The best you can do in this sort of place is to put on your headnet, line your tent with cheese-cloth, use repellents and sprays, and face the quiet summer days with as stout a heart as possible.

FROSTBITE

Frostbite is the freezing of some part of the body. It is a constant hazard in sub-zero operations, especially when the wind is strong. Frostbitten skin becomes whitish and the flesh becomes stiff. As a rule, frostbite causes numbness rather than pain. The parts that are most easily affected are the cheeks, nose, ears, chin and forehead, wrists, hands, and feet. Prevention is a matter of taking proper precautions. If and when you become frostbitten, thaw the frozen parts promptly. Neglected frostbite ultimately causes gangrene.

Frostbite may be classified according to its degree of severity. First degree frostbite is a superficial freezing which results in no loss of tissue. It usually covers a small area with a waxy white skin discoloration. Second degree frostbite is a moderate freezing of tissue which results in the loss of only the superficial layers of skin. Its appearance is much the same as that of first degree frostbite. Third degree frostbite is a deep freezing of a relatively large amount of tissue which results in eventual death and loss of tissue deeper than the superficial skin layers. During the frozen stage, a third degree frostbite appears the same as the second degree, although it is of a much greater extent. Upon thawing, there is mottling, and evidences of gangrene often appear early. The amount of pain is no indication at all of the severity of the frostbite.

Causes

Frostbite is caused by exposure to severe cold, particularly in wind. Contributing factors are loss of body heat and poor blood circulation, the latter a condition occurring naturally or caused by overtight clothing. Clothing that is wet, either because of external causes or sweat, is especially dangerous. Insufficient clothing also adds to the risk. Further important contributing factors are shock, extreme fatigue, improper diet, and excessive carbon monoxide.

Treatment

The sooner you begin treatment of a frostbitten part the better. Treatment of first degree frostbite requires no procedures other than simple thawing of the part that is

1474

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

frostbitten. Where it is possible, the best treatment is exposure of the involved parts to air at approximately 70°F. In the field, thaw minor frostbites of the face by holding a warm bare hand against it. To thaw a frozen wrist, grasp it with your warm hand or stick it inside your pants. Thaw frozen hands against your chest, under your armpits, or between your legs at the groin. If you need to thaw a frostbitten wrist, ear, or parts of your face, and your hands are cold, warm them first as just described. Thaw frozen feet by holding them against a companion's belly or between his thighs. Change to warm, dry, footgear or, if these are not available, remove the cold shoes and socks and wrap your feet with skins or sleeping bags.

Treat second degree frostbite in the same manner, but protect the injured area by dry, loose, sterile bandages and foot cradles where necessary. Place the injured area in a comfortable position, but never immobilize it by the use of pressure dressings. Elevate frozen limbs slightly to help the circulation.

You may treat third degree frostbite in the same manner, but of course gangrene is usually a complicating factor and treatment will definitely involve medical assistance. Recent methods of treating third degree frostbite, such as the use of decoumoral, heparin, histidine, and sodium ascorbate have not been sufficiently tested to permit strict evaluation of them. Even medical officers should use them only when they have strict and accurate laboratory control facilities and experience in their use.

Never rub a frostbite. This breaks skin tissue, causing open wounds, and in sub-zero temperatures wounds

Thawing Hands.

heal very slowly. Bending frozen arms, legs, or ears also breaks skin tissues. Never apply snow or ice - they increase the freezing. For the same reason, never warm frozen limbs in kerosene or oil unless you know their temperature accurately, as these liquids may be so cold that they will increase the frostbite. On the other hand, do not get too near a hot stove or other source of heat or use hot water to thaw a frostbite. Too rapid thawing increases pain and damages skin tissues.

When frostbite is accompanied by breaks in the skin, put an ointment like boric acid or vaseline over them and cover with a loose dry, sterile bandage. If infection continues, you might have to take sulpha medicine orally, as directed by a physician.

A burning sensation like that of sunburn follows the thawing of a frozen part, and the treatment following the thawing is the same as that for sunburn. The thawing of serious frostbite may be very pain-

1475

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

ful. Do not break the blisters that sometimes develop -a medical officer should open them. If they happen to break, trim off the dead skin with scissors and treat them as you would an open wound or burn. Always report to the Dispensary for any degree of frostbite. To soothe post-thaw burns, apply a good burn ointment, preferably lanolin.

Prevention

Keep your clothes loose to allow free circulation of air. This keeps them dry, and is the most important method of frostbite prevention. Protect yourself as much as possible from wind blast. Be careful also not to become overly fatigued and lose your body heat reserve. Avoid becoming over-heated, for excessive sweating means soaked garments. Should you get wet, change as soon as possible to dry apparel. When you do heavy work, loosen your clothing and throw your parka hood back. During the pause, however, put on extra clothing to prevent chilling.

At all costs, keep your feet and hands warm and dry. Your shoes or mukluks should be big enough to allow two to five pairs of socks without binding. Insoles of felt or senna grass contribute to dryness. When you make camp, change at once to dry footgear and lie so that your feet are nearest the fire. Wear heavy wool mittens with outer mittens of windproof cloth (such as canvas).

There is some dispute as to the advantages and disadvantages of wearing a beard. Some feel that it helps because it serves as external insulation; others that moisture from the breath collecting on it converts it into a virtual ice mask. It probably depends on your own individual preference and the size and thickness of the beard you grow. If you wear a beard, keep it clean and combed. If you don't wear a beard, clip your facial hair rather than shave. When it is necessary to shave, you can avoid chapping by shaving before going to bed rather than in the morning and by applying a thin film of lanolin to your face

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

to restore natural oils.

To guard against a frozen face, wear a parka hood that projects well beyond your face; you can adjust the hood to shut off the wind. You can protect your face also by the use of a wind proof cover over the lower part of it. "Make faces" from time to time and touch your face to test for stiffness. Also watch your companions' faces for tell-tale spots. To maintain good circulation in your ears, press them forward now and then.

Keeping in tip-top physical condition through adequate rest and proper diet is a major frostbite preventative. Alcohol increases the risk of frostbite because it seriously disturbs a man's judgment, his body's normal heat production, and its control of body temperature. Never drink alcohol before going out into the cold. As far as satisfying warmth is concerned, a cup of hot chocolate will go further.

Cold Exposure

Cold exposure, sometimes termed advanced general freezing is evidenced by muscular weakness, fatigue, stiffness of limbs, and overpowering drowsiness. The victim's sight grows dim; he staggers, falls, and becomes unconscious. If pulse and respiration are detectable, recovery is possible even though the body is rigid.

It used to be thought that treatment of cold exposure consisted of a very gradual rewarming of the body. Lately, however, it has been discovered that the best treatment is rapid - not gradual - warming. The victim has suffered a loss of the body heat reserve, and warmth must be restored immediately to help him recover. The best treatment, therefore, is hot baths and hot stimulants. An effort must be made to bring the patient back to normal body temperature as rapidly as possible. Such treatment is vital even when the patient hasn't been thoroughly overcome by cold exposure. Thus, if a person has been frostbitten after having been out for a long time in the cold, it is better to treat him for the cold exposure first, then for the frostbite. A simple and thoroughly reliable method for determining whether a person suffers from cold exposure - or hypothermia, the medical term - is to take his oral temperature. If it is below 96°, treat him for cold exposure.

All the frostbite preventatives apply as well to hypothermia. Proper clothing and good physical condition are particularly important. Clothing that is adequate, loose, and dry helps to retain body heat. Eating well and getting enough rest are equally important in preventing the rundown physical condition that invites the risk of freezing to death.

Snow Blindness

Snow blindness is both very painful and wasteful of time but with proper care you can prevent it. Make every effort to avoid the first attack, because it makes you more susceptible to others. Recurrent attacks may permanently impair your vision. In the polar regions, delays are serious and often dangerous. For this reason alone, a snow-blinded person is a liability. With a slight attack, he must lie over for at least a day. A severe attack means longer halt. The victim's usefulness, moreover, is reduced even after he is again able to travel.

The cause of snow blindness is an overabundance of light produced by reflection or glare from snow. Over-

1477

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

Improvised goggles.

cast days as well as sunny ones are snow-blinding days; so also are days of light fog. Keep in mind that snow blindness may result from very short periods of exposure to glare. During overcast days, there is multiple reflection back and forth between the cloud ceiling andthe snow, and there are no shadows, causing the ground to look level. This causes straining of the eyes and makes them more susceptible to snow blindness.

If your eyes feel sandy, burn, grow red, fail to focus properly, and become increasingly sensitive to light, stop using your eyes. These are the first symptoms of snow blindness. Sometimes, you may not have any symptoms during the day of exposure but may be awakened by a terrific headache about three o'clock the next morning. The final state is intense pain.

Keep the victim of snow blindness in a dark place or bind his eyes with a dark bandage. A cold compress is helpful. Have him rest until recovered. If traveling, blindfold and lead him.

Colored glasses are the surest means of preventing snow blindness. Heavy horn-rimmed Air Force goggles, which are rose tinted, give ample protection with little eye strain or fogging. For blizzard conditions, a leather-lined plastic or metal slit-goggle is useful. Eskimo goggles have the special virtue of not frosting over, but they limit the field of vision. You can make these of wood by burning or cutting out slits large enough to admit a half-dollar. Place one of these over each eye. Keep them on with a cord about the head. You can make glare shields by Cutting T-shaped slitsin thin pieces of wood or shells. Bind the "lenses" together and keep them on with a cord.

Wear colored glasses (or their equivalent) constantly for daytime operations in snow or ice-covered regions, and carry spares in case of breakage. When your glasses cloud or frost over, resist the impulse to remove them or to peer around the rims. A thin coat of glycerin on the lenses will partly prevent clouding. If you are without an anti-clouding preparation, keep the glasses on, removing them only occasionally to clean them; have a handkerchief always handy for this purpose.

Blacking your nose and around your eyes, as well as looking at dark objects as you travel, helps somewhat to reduce glare, but remember, these are merely extra precautions, and are not a substitute for dark glasses.

Sunburn

Sunburn is a major source of discomfort in summer operations where there is much snow or ice. It is caused both by the direct rays of the sun and by reflection of light from snow and ice surfaces. Lips

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

and nostrils are especially susceptible. Sun-blistered lips that become infected can produce serious results. Use lanolin cream to soothe the sting of sunburn. The best preventive is the application of a mild opaque ointment such as petroleum jelly or lanolin along the red line of your lips and at the corners of your nostrils. Resist the temptation to remain stripped to the waist longer than a few minutes on a very sunny day. Wear at least a light garment at all times. Remember that it is the combination of direct and reflected sunlight that causes the bad cases of sunburn.

Carbon Monoxide Poisoning

Whenever you use a stove, fire or gasoline heater indoors, there is danger of carbon monoxide poisoning. Many cases have occurred among ground crews working in planes and using gasoline heaters for warmth. Carbon monoxide is a deadly gas and is particularly dangerous because it is odorless. Make sure, therefore, of a steady supply of fresh air in your living and working quarters.

Generally, there are no symptoms, With mild poisoning, you have a headache, dizziness, yawning, weariness, nausea, and ringing in your ears. Later on, your heart begins to flutter or throb. But the gas may hit you without any warning whatever. You may not know that anything is wrong until your knees buckle. When this happens you may not be able to walk or crawl. Unconsciousness follows; then death. Or you may be asphyxiated as you sleep.

In case of carbon monoxide poisoning, get the victim into fresh air at once but keep him warm. In winter, fresh air means merely circulating air that is free from gas; exposure to outdoor cold might cause collapse. If the only fresh air is outdoors, put the patient in a sleeping bag for warmth. Hot water bottles and hot pads are helpful in maintaining body temperature. Keep the patient absolutely quiet and warm for at least a day. Never exercise a carbon monoxide victim. This further reduces the precious supply of oxygen in his blood, and increases his demand for it. If a gassed person stops breathing or breathes only in gasps, start artificial respiration immediately. In the latter case, your movements must be carefully synchronized with the victim's gasps. Use pure oxygen and a mask if available. Breathing pure oxygen removes carbon monoxide from the blood faster than does breathing air. The only preventive of carbon monoxide poisoning is proper ventilation.

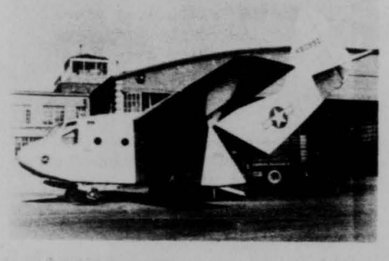
XC-123's FIRST FLIGHT MAY MARK END OF TOWED-CRAFT ERA, ASSAULT TRANSPORT DESIGNED TO REPLACE GLIDERS

The first flight of the Chase XC-123 may have marked the end of the glider era, Air Materiel Command officials believe. Glider men in AMC's Engineering Division have long sought a means of ridding themselves of the parasitic glider which always depended on a C-47 or other tow plane to become airborne. They now think the Chase-C-122, which can carry 8000-lb of equipment 750 miles, and the XC-123, which can carry twice that weight the same distance, can do the job previously performed by their glider counterparts.

Despite the addition of power plants, gasoline, and oil, the assault aircraft can carry the same combat loads as towed craft. Besides, it was pointed out, the assault gliders can return to their home bases under their own power.

In describing the evolution of the latest Chase ship, Cargo Branch men at AMC trace it back to two wartime experiments, the PG-2A, built by Northwest Aeronautical of St. Paul, Minn., and the XPG-3A, built by Waco. Both were equipped with power plants. The former had two Ranger engines; the latter was fitted with two Jacobs propeller-turners.



January 1945 saw Chase's first model, the XCG-14 all-wood non-powered glider towed into the air for the first time. Nine months later, its offspring, the part-wood, part-metal XCG-14A also was borne aloft. The XCG-14 was equipped with a removable tail to facilitate loading of equipment. In the XCG-14A, the tail was modified so that it swung upward, an improvement in ease of loading.

By December 1947, the B-18A, another Chase craft made completely of metal to reduce deterioration and minimize the effects of possible enemy incendiaries, had taken to the air. This model became the C-122 when two Wright R-1820 engines, each rated at 1475 hp, were added to late production versions. The G-18A had another tail change, with the wide rear door swinging up and the loading ramp down, so that wheeled combat vehicles could be driven right into the ship. Still to come is the XG-20, with twice the capacity of the G-18A (16,000 lb as against 8000), and it is from this glider that the XC-123 was built.

The new Chase XC-123, the tail of which stands more than three stories high (32 ft 8 in.), has a wing span

THIS PAGE IS UNCLASSIFIED

of 110 ft and an over-all length of 77 ft. Powered by two Pratt & Whitney R-2800 engines, each rated at 2100 hp, it weighs 25,000 lb empty. Despite its designed capacity of 16,000 lb, the manufacturer believes it can carry a useful load much greater than its empty weight.

Equipped with the unique loading ramp which proved so successful in the C-122 and G-18A, the assault transport can carry a 155mm howitzer and a truck, or any other comparable combination of wheeled combat units after they are driven into the ship.

For simplicity in loading other cargo, the ramp can be swung down to any intermediate tailboard level, and the transfer of cargo from truck to palee is made as simple as loading trucks at a warehouse platform. To load heavy shipments or vehicles without power, a cable can be passed from the load at the rear of the plane through the cargo hold, out the nosewheel well, and hooked to an external power source to haul the heavy objects aboard.

As a personnel carrier, the giant Avitruc can transport 62 fully equipped combat troops or 50 litter patients. Basically, it is designed for the transport of forward-based combat and engineer troops, troop supplies, evacuation of wounded, and other uses to which a transport with fast-loading characteristics is adaptable. Personnel can enter side doors which are also suitable for parachute jumps. The tail surfaces are mounted high to provide loading clearance for trucks, and therefore would not endanger paratroopers jumping from the ship.

AMC project engineers say the main reason for the excellent performance of the Chase assault craft is its wing design. The wing on the XC-123 and its predecessors has a high aspect ratio, providing exceptional short-field take-off performance and a moderate wing loading. With all this, however, the plane can cruise at 200 mph. Like all assault aircraft, it can also land within short distances on improvised runways.

Other features of the Avitruc include a tow-release mechanism both in the nose and tail (making the XC-123 adaptable as a glider or tow airplane); engine installation which permits removal of the entire nacelle and its replacement within 45 min; jettisonable self-sealing fuel tanks (for the elimination of fire hazards in crash landings); specially fitted windows in the cockpit and cargo compartment which can be removed with one motion for quick exits in ditching; and a high degree of crash protection offered the crew by the structure of the pilot's cockpit.

The cargo-compartment floor is specially designed for cargo handling. Numerous high-strength tie-down fittings make it possible to secure loads against damage even though crash loads of as much as 8 g factors are sustained by the aircraft.

Although assault aircraft are a long-range AMC project dating back more than five years, the Army field Forces and the Troop Carrier Command have been quick to realize the advantages of this type of airplane. Since the C-122 first appeared, the AMC officials say, those organizations have been anxiously awaiting future versions for their use.

SOVIET SECRET MEASURES

No country in history has established such extensive categories of state secrets as the Soviet Union did in June, 1947, two years after its avowed enemies - Germany, Italy, and Japan - had been destroyed as great powers. Few countries have manifested such an obsession for secrecy, an obsession which has been officially intensified concurrently with a campaign to end "subservience" to foreign influences and admiration for the achievements of other countries. The Soviet security measures go far beyond the limited secrecy measures instituted by other countries. The comprehensive character of Soviet censorship, particularly its concern with matters which on the surface lack military significance, necessarily suggests that the Kremlin: (1) Fears that such information is at variance with the vague claims of economic, cultural, and social accomplishments advanced by the Soviet Government, and/or (2) is carrying on activities which are at variance with the Soviet Union's postulations of peaceful intentions and desires to collaborate with other countries.

The extravagance of current Soviet claims probably explains much of the present censorship blackout on all parts of Soviet life. If conditions were really so superior within the borders of the Soviet Union there would be no need to prevent foreigners from testing with their own eyes the veracity of the Communists' claims.

The postwar period has witnessed a feverish intensification of spy scares in the USSR and a progressive stiffening of laws restricting the flow of information. A new list of state secrets was issued in June, 1947. It included military, economic, and scientific information and contained a significant omnibus clause permitting almost anything to be classified as secret. Typical of its contents is the clause classifying scientific information as secret:

> The discoveries, inventions, technical improvements, research, and experimental work in all branches of science, technology, and national economy (are secret) until they have been finally completed and permission to publish them has been given.

At the same time a law was passed increasing the penalties for divulging secret information. Passage of this legislation furnished an occasion for many speeches and articles calling for increased vigilance against foreign spies. These laws did not affect the release of information by the government, but their enactment signified that the government was far from relenting in its stern attitude toward any seepage of information about the USSR to the Soviet population and the world outside.

At the end of 1947 a law was passed which required that relations of representatives of foreign governments in the USSR with Soviet citizens and institutions be channeled through the USSR Ministries of Foreign Affairs and Foreign Trade. This reduced further the small area of informal contacts between Soviet citizens and foreigners, because a large part of the foreign colony in the Soviet Union now consists of representatives from foreign governments. In any case, the law was interpreted by many Soviet citizens as applicable to all foreigners. This interpretation was no doubt reinforced by the ideological campaign against foreign influences and by

1485

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

the fact that in February, 1947, the Presidium of the Supreme Soviet had banned marriages of Soviet citizens with foreigners.

The pressure to isolate foreigners in the USSR from Soviet citizens was made more severe in September, 1948, when the Soviet Government instituted new regulations governing the physical movements of foreign representatives. These regulations barred three-quarters of the Soviet Union from visits by foreign officials. Foreign correspondents and most other foreigners in the Soviet Union are virtually confined to Moscow and its environs.

No comprehensive economic statistics have been published by the USSR since the prewar period. Current claims of economic achievements are given in terms of percentage increases over some earlier attainments. Since the base figures have not been published, the communiques lack real significance. Data on purchasing power and cost of living have been suppressed since the 1920's. Penal statistics have been carefully concealed for the last twenty years of the Soviet regime. When figures on the number of persons in penal institutions were published, they showed a tendency to increase, and the cessation of publication in the late twenties was followed by repressive measures, such as the liquidation of the kulaks, which increased greatly the number of inmates in "corrective labor" camps. Even educational statistics are subject to censorship.

The laws establishing censorship have the double aim of concealing data which the government does not want disseminated and of insuring that the ideology conforms to the correct and most recent line. The fact that almost all the media of communications are monopolized by Communist Party and Soviet Government organizations would seem to simplify, if not completely eliminate the need of control: In the USSR all printing equipment and even mimeograph machines are subject to registration with the police and can only be in the possession of certain groups. Sharp and precipitous changes in the Party line, however, appear to make necessary Communist censorship of even the most faithful Communists. Positive censorship control over content of publication, radio broadcasts, etc., rests with Glavlit (Glavnoye Upravleniye po Delam Literaturi i Izdatelstv, or Chief Administration of Literary and Publishing Affairs). Glavlit representatives examine all material before and after publication, and affix a permit for the appearance of given works. The sweeping nature of Glavlit's role is indicated by the statutory definition of its functions:

> Preliminary and final (subsequent) control over published literature from the politico-ideological as well as military and economic points of view, also with respect to radio broadcasting, lectures, and exhibits ...
>
> Confiscation of editions not considered fit for publication...
>
> Issuance of permits for opening publishing houses and periodicals, closing publishing houses and publications, prohibition and permission of importation from abroad and exportation of literature, pictures, etc., in accord with the existing laws...
>
> Working out, together with the proper offices, of lists of information comprising specially guarded state secrets not subject to publication and promulgation...
>
> Preparation of lists of works published for publication and distribution...

The C-124 is two and one-half times the size of the Douglas C-54 Skymaster and has a designed gross weight of 175,000 pounds. Despite its larger size, it is expected to operate from the same short fields that the Skymasters use.

The plane is designed to carry 50,000 pounds of military cargo 850 miles and return to the base without refueling. Lesser loads to be carried even greater distances. The C-124 will be used to transport heavy ground force equipment such as tanks, field artillery, bulldozers and fully-loaded trucks - landing the equipment at "airheads" that have been secured by an airborne attack of paratroopers and glider troops.

Like the sea-going LST of World War II, the C-124 has unique clam-shell doors in the nose of the plane and a ramp for loading and unloading vehicles. The ship may also be loaded by means of an electric elevator set into the plane's underbelly, amidships.

Wing span of the new transport is 173 feet three inches; length, 127 feet two inches, and it is 48 feet three inches high. The cargo hold is 13 feet wide, 12 feet 10 inches high and 77 feet long which provides more than 10,000 cubic feet of cargo space. Four Wasp Major engines provide 3,500 horsepower each at takeoff.

As a personnel carrier, the interior of the C-124 may be quickly converted into a double - deck cabin with a capacity of 222 troops and their field equipment. When used as an airborne hospital 123 litter patients, 45 ambulatory cases and 15 nurses may be carried.

The Air Force has ordered 29 production C-124's from the Douglas Aircraft Company from Fiscal Year 1949 funds. Taxi tests on the prototype have begun and its maiden flight was scheduled to take place before the end of November.

AIR INTELLIGENCE Review

This "Review" is published for three reasons:
1. To provide timely data regarding new techniques, practices and general information whereby intelligence personnel can maintain proficiency.
2. To provide material which will afford all personnel an appreciation of the intelligence role.
3. To provide a medium whereby all intelligence personnel and activities may exchange viewpoints, problems and solutions.

Two types of material are solicited for publication:
1. Stories and pictures relating to the intelligence activities being conducted within an organization.
2. Original articles of a noncontroversial but informative nature.

Material submitted must include sources utilized and the authors name, rank and present military affiliation. Mail stories to: The Editor, "Air Intelligence Review," ConAC, Mitchel Air Force Base, New York.

WARNING— THIS DOCUMENT CONTAINS INFORMATION AFFECTING THE NATIONAL DEFENSE OF THE UNITED STATES WITHIN THE MEANING OF THE ESPIONAGE LAWS, TITLE 18 U.S.C., SECTIONS 793 AND 794. NATIONALITIES IN THE SOVIET ARMED FORCES

Principal Type of National Unit That May Continue To Appear is One Which will form Nucleus for a Projected Foreign Soviet Dominated Military Establishment

Of the 195,000,000 people who live in the Soviet Union, only about 60 percent are Russians. The remaining 78,000,000 include many national groups, ranging from Belorussians to Bashkirs. Antipathy to the Soviet form of government, traditional distrust of the Russians, and technological and social backwardness limit the military value of these ethnic minorities.

Soviet policy with regard to the utilization of these ethnic minorities in the Armed Forces has varied according to political expediency. At times when it has been advantageous to appeal to the local national interests of these groups, units with national composition and designation have been favored. Foreign military groups, such as Polish and Czechoslovak units, have been formed on Soviet territory, to serve as nuclei for Soviet-sponsored armed forces abroad. At present, national or ethnic origin normally has no official, and little practical, bearing on an individual's military service.

THE EARLY RED ARMY

The early Red Army was anything but uniform either in organization or in national composition. It was a collection of provisional units held together by the centripetal force of a few tens of thousands of energetic political commissars. There were battalions of Lettish riflemen, bands of Caucasian partisans and brigands, and even units of armed Chinese coolies, as well as a vast gray mass of Russian peasants - all leavened by politically conscious worker-soldiers from the big cities.

During the Civil War which followed the Bolshevik Revolution, various theories for and against national units in the Red Army were advanced; but, until peace came, local necessity was the urgent arbiter of the problem in each case when it arose.

THE TERRITORIAL SYSTEM

Beginning in 1924, the Red Army settled into a peacetime mold which lasted for more than 10 years. Backing a standing army of about 40 divisions were some 45 territorial or reserve divisions, which had regular cadres of from 5 to 10 percent of T/O strength. The remainder of their personnel consisted of semi-trained reservists who served for brief periods, usually not over a month at a time. These units, organized on a regional basis, eventually included no fewer than 17 non-Russian divisions.

The Soviet regime had inherited a policy of discrimination against minority peoples from Czarist Russia and, despite its Marxist equalitarian doctrines, continued to apply it, at least in part, for many years. In Czarist times, the peoples of

Central Asia, the North Caucasus, and various Siberian aborigines - most of whom spoke no Russian - had only a colonial status and did not render military service. This practice of limiting military liability was unofficially sanctioned by the Soviets in the 1920's and early 1930's, when only Ukrainian, Belorussian, and Transcaucasian separate units were formed. The lesser breeds for all their theoretical sharing in the new enlightment, apparently were considered as still too unreliable and too untutored to enjoy full military equality.

In 1939, the territorial system was scrapped. The Red Army was rapidly expanding and becoming modernized. The half-trained and inefficient territorials were integrated into the Regular Army. To hasten training, their personnel was shuffled and reassigned. National units were jettisoned as unsuitable in the monolithic, all-union army.

EARLY WAR MEASURES

During their two years of distrustful friendship with the Nazis, before they were drawn into the war in 1941, the Soviets carried out military moves which had some bearing on the nationality problem in the Army. In 1940, they engulfed Estonia, Latvia, and Lithuania and inherited the modest armies of these three countries. For the sake of appearances, perhaps, the armies of these hapless countries were maintained substantially intact, though with a heavy dilution of Russians and Communist Balts. The Baltic generals received commensurate rank in the Red Army and were given semi-honorary assignments. One such general still occupies a quiet post on the faculty of the Frunze Military Academy.

The Cossacks, hateful symbols of Czarist repression, had lived under a cloud during the first two decades of Soviet rule in Russia. Many had fought on the Red side in the Civil War (the present Minister of Armed Forces, Marshal A. M. Vassilevski, is a Cossack, as are several other high-ranking Soviet officers), but the hostility of the unruly Cossacks to collectivization in the early 1930's seemed to confirm the Soviet leader's worst suspicions. It was not until the late 1930's that the Cossacks were rehabilitated. By 1941, Cossack cavalry units were formed, and the Cossack tradition and uniform were glorified. Most of the Cossacks served their country well in World War II, although considerable numbers of them fought for the Germans. Despite deep lingering resentment against Soviet farm policies, the Cossack villagers in South Russia generally behaved well in the face of the invading enemy. Cossack cavalry divisions fought splendidly and were awarded more than their share of citations, perhaps partly as a matter of policy.

The steady prewar tempo of mobilization before the German onslaught of June 1941 was greatly accelerated after war broke out. There were few trained reserves, and soon dozens of divisions were being activated, assigned raw fillers, and shipped to the front with only a few month's training. The careful distribution of recruits from any given region was abandoned, and divisions and even whole armies were formed on a regional basis.

Shortly after the beginning of the war, unprecedented appeals were made to what the Soviets shortly before would have dismissed as chauvinist and thoroughly un-Marxian national patriotism. Old Russian heroes became fashionable, including the early Ukrainian nationalist, Bogdan Khmel-

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

nitsky. A reflection of this exploitation of patriotism and national pride (and a convenient mobilization device as well) was the reintroduction of national Units. Many Transcaucasian divisions and a number of Turkmen, Kazakh, and other Asiatic divisions were activated and publicized. The Baltic units retained their distinctive titles and were filled with unenthusiastic Baltic recruits from labor camps and refugee camps. Buryat Mongolian units were organized in the Far East. On the other hand, apparently no Great Russian, Ukrainian, or Belorussian units bearing distinctive national titles were formed.

The Soviets' experience with their national units was not encouraging. The troops were, for the most part, only half-trained and had little zeal for the Soviet cause. Many had been drawn directly from crude, semi-nomadic surroundings. It was not surprising that they fought half-heartedly, deserted readily, and generally proved unequal to the demands of modern war. The Armenian units which distinguished themselves in the defense of Stalingrad and Sevastopol were exceptional.

The Germans attempted, with moderate success, to take advantage of the lack of enthusiasm found in the minority nationalities for the USSR, although they fumbled their grand opportunity of forming effective anti-Soviet units of Great Russian personnel. From prisoners of war and deserters the Germans eventually formed 2 Cossack divisions, 1 Turkestan division, and about 100 special battalions for static defense in the West, composed mainly of Ukrainians, Georgians, Armenians, Azerbaijans, North Caucasians, and Turkomans.

THE DISAPPEARANCE OF NATIONAL UNITS

The Soviet Army, meanwhile, had reached its full strength of over 500 divisions by 1943, and thereafter its personnel problem was primarily one of replacement rather than producing new units. The overburdened and inefficient replacement system worked on a bulk basis. Replacements were combed out from the interior, they were impressed in reconquered territories, and many came from battered, demoralized units that were withdrawn from the line and inactivated. Niceties of national and regional origin were not considered. Georgian divisions, for example, ended the war in 1945 with more Western Ukrainians, Bessarabians, and Belorussians than Georgians, while Georgian replacements were sent to Great Russian divisions or wherever else they were needed at the moment.

Thus, by VJ-day, the national units had become blurred, mixed, and no longer distinctive in personnel composition. The experiment with national units - somewhat embarrassing as a whole to the Soviet regime was abandoned as no longer of propaganda or practical mobilization value. There remain a few such units, including an Armenian division in the Caucasus and a Latvian division in Latvia. But in general the present policy of sending recruits to serve in units far from their homes has eliminated national units as a practical fact in the postwar Soviet Army.

FOREIGN NATIONAL UNITS

During World War II, the Soviets formed several foreign units which fought as part of the Red Army on the Eastern Front. A sizable Polish force was formed of Sovietized Poles and unwilling remnants of the 1939 Polish Army, and was committed in 1943. It was commanded by a Soviet puppet, General Berling, who has since sunk into obscurity. This Po-

1497

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

lish organization eventually was expanded into the present Polish Army. Smaller Czechoslovak and Yugoslav units were activated and sent to the front. A number of French aviators were organized into the Normandie Squadron, which fought with the Soviet Air Force. These organizations had only political significance, as a counterpoise to the various armed forces of the Allied Governments-in-exile in London.

DISCRIMINATION

Although national and racial discrimination is expressly forbidden by the Soviet Constitution, it does exist in the Soviet Union and is reflected to some extent in the Armed Forces.

Anti-Semitism, for instance, is often reported. Jews as a national group served with distinction in the Armed Forces during World War II, and they earned a generous share of decorations and awards. Yet there is evidence that a quota system is now applied to Jews in some military academies. The restoration of many Czarist army traditions and forms during the war apparently carried with it some revival of the old army's anti-Semitism.

Certain nationalities are considered unreliable by the Soviet regime because of the behavior of some of their members during the war. Shortly after VE-day, the Crimean Tatars and the Chechen-Ingush people of the North Caucasus were uprooted and moved en masse to the dumping ground of deep Siberia. Few if any men of these nationalities are now serving in the Armed Forces, and certainly none in responsible positions. The half-million Volga Germans - residents of Russia for almost 200 years - were resettled east of the Urals by the Soviets in 1941 and have scarcely been heard of since.

In general, however, apparent discrimination against members of any nationality is more the result of that nationality's generally low educational and technical level than a matter of outright discrimination. Russians, Ukrainians, Belorussians, and Armenians, for instance, possess more skills of military value in a modern army than do Kirghiz, Tadzhiks, or Yakuts. Therefore, personnel from the four first-named groups get the better assignments. Nevertheless, there are hundreds of generals in the Soviet Army whose names indicate that they are of non-Russian origin.

TRENDS

The problem of nationalities in the Soviet Armed Forces is gradually being solved by outside factors. A third generation of Soviet Asiatics and Caucasians, as well as of Soviet Russians, is growing up. Young members of the backward nationalities are leaving their nomadic and feudal surroundings and are learning to drive tractors, work in laboratories, and make steel. The unprecedented internal migrations within the Soviet Union are producing a great deal of inter-marriage, with a resultant breaking down of ethnic barriers. Asiatics are reported to be settling in Bessarabia, while the restricted areas of Siberia are teeming with transplanted Lithuanians, Ukrainians, and other peoples from the western border areas.

Thus, the need and opportunity to form national units are disappearing while present Soviet policy does not favor the practice.

As circumstances arise, groups of foreigners will continue to be or-

1498

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

ganized into national military organizations as in the past. The so-called Paulus Army and various Rumanian, Korean, and other groups were established to serve as cadres for Soviet-sponsored military organizations in their own countries. On the other hand, since no major opportunity developed to employ the thousands of Spanish Republicans who were given sanctuary in the USSR in 1939 when their Government collapsed these unfortunates were pushed aside and became a diminishing band of unwanted "step-children" of the Soviet Government.

CONCLUSIONS

The USSR is gradually solving her minority problems. Also, with this solution at the national level, the special problem of ethnic minorities in the armed forces is losing significance. Two experiments with national units - - in the 1930's and during World War II - - were both abandoned as impracticable.

Certain minor nationalities, considered unreliable by the Soviet regime, are still largely excluded in the Armed Forces.

The principal type of national unit which may continue to appear in the Soviet Union is the nucleus for a projected foreign Soviet-dominated military establishment. German, Polish, Rumanian, and Korean units of this type have been formed, and later transplanted abroad.

The problem of minor nationalities in the Soviet Army is generally disappearing, and the Soviet Armed Forces are a relatively cohesive whole.

TITLE: Outline of Guided Missiles

AUTHOR: Brig.Gen. W.L. Richardson

SOURCE: Ordnance July-Aug '49 (34-175 Bi-Mthly); pp-43-44; illus.

ADDRESS: Ordnance
705 Mills Building
Washington 6, D.C.

The significance of the guided-missile program of the National Military Establishment is elucidated. This program has been designed to provide the Air Force with superior weapons with which to accomplish the three prime missions of the USAF. These missions are: The conduct of strategic air warfare; the air defense of the United States; and the support of the other services. Military characteristics for guided missiles have been formulated to serve as goals toward which research and development should strive. Now the scientists and engineers are working to meet the performance objectives. There are two general types of guided missiles available to us today; the rocket, and the air-breathing missile. The latter is capable of much longer ranges than the former. The guidance and control problems connected with the air-breathing missile are not so difficult as with the rocket. In a program as large and complex as the guided-missile program of the N.M.E. it is necessary to avoid undesirable duplication. Co-ordination throughout the services is largely effected by the Guided Missiles Committee of the Research and Development Board.

SOCIOLOGICAL FACTORS IN STRATEGIC INTELLIGENCE

People are more alike than they are different. However, there are differences in the various peoples of the world, and for that reason, among others, strategic intelligence examines the peoples of foreign nations. It examines them collectively and not as individuals.

Sociology is the study of groups of human beings - their numbers and types, the activities of each group, and their character, habits, and attitudes. The actions of human beings are largely influenced by their social institutions and customs. These include such things as family, religion, education, trade unionism, caste, position of women, aristocratic privileges, and habits of thinking, to mention a few.

Sociology, then, covers a very broad field, and, as military men, we may not be interested in all of its aspects. Hence, intelligence in the sociological field is concerned with groups of human beings, their numbers, types, activities, and character, insofar as they have a bearing on the strategic capabilities and intentions of foreign powers.

For strategic intelligence purposes, it is convenient to study groups of people under four headings: Public welfare, public opinion, labor problems, and population and manpower. Each of these points will be developed, with a somewhat greater emphasis placed on population and manpower.

PUBLIC WELFARE

The public welfare element of the sociological factor embraces the protection of health, living conditions, education, social insurance, police functions, and the like. Though not normally a field of great direct interest to strategic intelligence, a knowledge of public welfare matters may be valuable in the production of other kinds of intelligence. Certainly, they are matters of interest to our troops and to our military government occupying a foreign country.

For a moment, let us examine one specific example under the heading of public welfare, namely, education in the Soviet Union. In the days of the Tsars, the great mass of the Russian people were illiterate and little was done to improve their lot in this respect. The Bolsheviks, however, after the October Revolution of 1917, took a passionate interest in education and did much to raise the educational level of the people. Russia now claims better than 82 percent literacy for a population approaching 200 millions of people. This claim, however, is probably an exaggeration, and by our standards, the level of education is still rather low.

What is the strategic significance of a high literacy rate? The Soviets partially answer that question for us. They stated that the main task of their educational system was to help to achieve the goals of their first 5-year plan launched in 1928. One of these goals was (and still is) "to overtake and surpass in the shortest possible historical period the most advanced capitalistic countries and thus to insure the victory

1500

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

of socialism in its historic competition with the system of capitalism". Certainly a nation with an educational system that produces scientists, technicians, artisans, skilled laborers, and literate soldiers has a much greater war potential than one in which there is much illiteracy, a lack of scientists, and few people with technical skills.

PUBLIC OPINION

The national psychology of a country is an important driving force for peace and war. Many ingrained traits of the people go into what we call national morale and public opinion: National pride, national hatreds, religious beliefs and fanaticism, complacency, hero worship, aggressiveness, greed, and love of comfortable living. Intelligence must be produced on the state of national morale and public opinion (as distinct from the opinions of political leaders) as they bear on questions of national policy. Because public opinion - even in totalitarian countries - does set limits to political decisions, intelligence on public opinion is important. It has been proved that both public opinion and morale may be molded to fit a certain pattern by the clever use of propaganda, as demonstrated in Germany, Japan, and Russia. Such propaganda may therefore give an indication of the ambitions of the men who are directing the propaganda.

Again, consider a specific example: What is the opinion of the Russian people toward war with the United States? A public opinion poll on this question would be interesting. We do not know the answer, but there is certainly evidence that the Communist leaders in the Kremlin are concerned with public opinion, perhaps even on this question.

We know that the Soviet leaders make great effort to reduce the minimum contacts between their people and foreigners, both at home and abroad. Social contacts between the Russian and American soldier in occupied areas are forbidden by the Soviets. The number of Russian nationals who are permitted by them to come to this country, and to other countries outside the Soviet sphere of influence, is limited to those on strictly Soviet business. Those who are permitted to come are carefully screened so as to eliminate possible "deviationists." The Soviet government looks very unfavorably on Kravchenkos and Kasenkinas. Probably the most extreme step is the prohibition against Soviet women marrying foreign nationals, a custom that goes back to the days of barbarism.

Then too, the Soviet press is used to influencing public opinion. The Russian people are given but one point of view, that of the Kremlin. Almost every day we see in our papers quotations from Izvestia and Pravda about Western "imperialism", "terroristic methods", or "hooliganism". These and other actions by the Soviets show their concern for public opinion. Such actions also indicate that the Soviets are endeavoring to form public opinion.

LABOR PROBLEMS

Labor problems are important to the users of strategic intelligence. The willingness of labor to work under conditions fixed by management influences both the effective size and the productiveness of a country's labor force. Intelligence on labor problems is needed in order to determine the effectiveness of a country's labor supply. This kind of intelligence is based on the knowledge of the labor policies of both management and the government; the organization, strength, and control of the

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

labor movement; and labor's attitude toward an actual or potential war effort. Intelligence concerning labor problems is of considerable interest to the researcher in the field of economics

POPULATION AND MANPOWER

The last broad field of study under the sociological factor is population and manpower. From the viewpoint of our top-level planners and policy makers, population and manpower is probably the most important sociological aspect of a foreign nation. Why? Because population is the primary resource of a nation in the conduct of war, both on the battlefield and on the home front. The war potential of a nation's population is determined by numbers and rate of increase; the birth and death rates; capacity to perform work; and the general economic setting - agricultural or industrial.

From an intelligence standpoint, it is the increase, stability, or decline in the size of a population upon which we first focus our interest. The future size of the population of a foreign nation may be of more importance to us than its present size. Knowledge of future size will help us to keep our estimate of a foreign power's war potential correct.

Consider what has been happening to the world's population in the past 150 years. We are living in a period of unparalleled (but uneven) growth in the world's population. Since 1800, the population of the world as a whole has more than doubled. This rapid, almost explosive, growth first started in Europe, where the population since 1800 has trebled. The number of Chinese and Japanese has increased greatly, also, but their increase did not commence until well after the middle of the nineteenth century. In other regions, the timing of rapid population growth has varied.

The clue to rapid population growth is to be found in the changing relationship between birth rates and death rates. Before the Industrial Revolution, high birth rates almost negated high death rates, and there was little natural growth in population. The effects of the Industrial Revolution - the raising standards of living, sanitation, and health, and therefore in reducing infant mortality and in increasing life expectancy - were felt first in Western Europe, the United States, and Canada. Therefore, the populations of these areas increased rapidly during the nineteenth century. However, in more recent decades, because of cultural changes, such as the decline of the large family ideal, for example, there has been a drop in the birth rate. Thus, the margin between birth and death rates has been narrowing. The tendencies in these areas, therefore, is for population to level off, even to decline. With the extension of modern industrialization, sanitation, and medical care to other parts of the world, this same pattern of changing death and birth rates has appeared. Thus, China, India, the Soviet Union, and other areas more recently affected by industrialization are now in the stage of population growth that was characteristic of Western Europe several generations ago. It is likely that they, too, will in time pass into the stage of stable or even declining population.

The question may arise as to why the advent of industrialization, better sanitation, modern health facilities, and other factors, will bring about an increase in population, say in China or India. We think of

1502

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

modern industrial nations as nations of low birth rates, and such is the case.

As a nation develops from an agrarian economy to an industrial economy (as the USSR has been doing for the past 30 years), it goes from a period of high death and birth rates to one of low death and birth rates. In this change, death rates fall faster than birth rates; however, they both eventually reach a rather low level.

The reason for the lag in the fall of birth rates is that people accept material changes more quickly than cultural changes. The introduction of more efficient methods of industrial and agricultural production, improved sanitation, better medicine and hygiene bring about lower death rates. On the other hand, "family form and function, religious doctrine, and community custom are all focused toward the maintenance of high fertility. High evaluations are placed on the perpetuation of the family, clan, or other groups, but low evaluation on the individual and his welfare. These values are deeply inbedded and rigidly enforced by social sanction. Even under the impact of a rapidly shifting environment, they change only gradually."

In contrast, low birth rates have appeared only in those societies "dominated by the values developed in urban life. Such societies set great store by the individual, his health, welfare, initiative, and advancement. They develop a rational and materialistic outlook on life, view man as the master of his destiny, and come to hold the deliberate control of fertility to be as reasonable and desirable as that of mortality. The transition from the earlier set of values to the new individualistic ones is gradual. Therefore, universally, the decline in the birth rate lags behind that of the death rate until both reach rather low levels. The interim affords a period of rapid population growth. Europe is only now coming to the end of its period of expansion". Mortality and fertility rates and changes in them, and population and population changes which result from the mortality and fertility rates are the basic data upon which we base our intelligence studies concerning population and manpower.

Now let us examine the population trend in two nations, one in which the number of people is decreasing and the other in which the number of people is increasing. In 1946, it was estimated that the population of the whole of Germany was about 66 million. This is an increase over the 1939 population in spite of war losses estimated at 2,850,000. The increase was due not so much from natural causes but to immigration, such as the movement of German people from Czechoslovakia to Germany. However, the present population is made up of a disproportionate share of women and old people. There are only 29 males for 37 females. The sex ratio becomes much more disproportionate in the middle-aged group of 18 to 50 years, where the males constitute but 30 percent of the group rather than a normal 50 percent. Bear in mind that it is this age group that is the most important to a nation, not only economically as the producers of goods, but also demographically as producers of children.

Besides the present number of people and the age-sex ratio, there are many other factors which will affect the future size of Germany's population. In general, the effect of these factors will be to cause the population to decline. Germany's food supply has been quite inadequate

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

and it appears that it will remain so for some time to come. There is a great housing shortage, and health and sanitary conditions are unsatisfactory. These are conditions that cause death rates to rise.

In Berlin, in the first quarter of 1947, the death rate was nearly three times as great as the birth rate, 28.5 deaths per 1,000 but only 10.7 births per 1,000. During the same period, infant mortality was 116 per 1,000. Compare these rates with the rates for New York City in 1946; Death rates, Berlin 28.5, New York 10.1; birth rates, Berlin 10.7, New York 19.6; infant mortality, Berlin 116, New York 27.8.

Then, too, economic conditions are and will be, such as to deter people from marrying. Those who do marry will have fewer children than they normally would have. As a result of the present economic and social conditions in Germany, one population expert estimates that by 1980 the German population will have fallen to below 40 million. So, where Germany is only second to Russia in population size in Europe today, in one or two generations her numbers will be reduced to where she is fifth - behind the Russians, the British, the Italians, and probably even the French.

The population of the Soviet Union today is estimated by our Census Bureau of the Department of Commerce at 193 million. This is an increase of more than 20,000,000 over her prewar population in spite of enormous war losses. The increase is due, of course, largely to the annexation of a new territory, the Baltic countries, part of Poland, Bessarabia, and other areas.

In contrast to Germany, the Soviet's population is increasing, and it is expected that it will continue to increase for a considerable time to come. Population projections indicate that by 1970 the Soviet population may reach 250 million. Of this number, 84 million will be men in that important economic productive age bracket of 15 to 64 years, whereas in the United States there will be but 53.7 million men in the same age bracket. It is also estimated that the number of men of military age in the Soviet Union will have increased by 13 million in 1970 over 1940, for a total of 43 million. Again comparing with the United States in this age bracket for the same period, the increase in this country will be less than 2 million or to a total of 24.1 million. On the basis of numbers alone, we are at a considerable disadvantage.

Numbers alone are not sufficient in themselves to properly determine the capabilities of a nation's population. We must know something about the quality of the people - their educational level, industrial skills, and attitudes - subjects that were mentioned earlier in this article. Then, too, we want to know where the people are - how the population is distributed throughout the country. Look back for a moment and consider the distribution of people in this country prior to the recent war, and recall the mass movements of people to the centers of war industries. War production requires a readily available labor market.

Lastly, there is a special demographic problem growing out of intelligence on manpower potential - the size and quality of the labor force. It concerns itself with the numbers having the necessary skills for war production, for agriculture, for the civilian economy. Also of

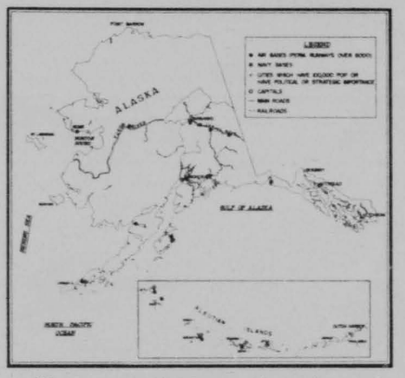
ALASKA AND NATIONAL POLICY



If the predictions that the next war will be fought over the Arctic are correct, it is time for an evaluation of our position in Alaska with respect to the part it will play in any future armed struggle. Some decision should be made either to abandon our half-hearted efforts of the past and get out, or else make intelligent use of the potential which Alaska offers.

Since 1941 our last frontier has loomed large in military planning and has assumed increased strategic importance in global air routes. The exact attention focused on this area (including the Aleutian Islands) has fluctuated from time to time depending upon the imminency of invasion by an Eastern power.

The problem of how much should be done in Alaska to make provisions for polar war would seem to be related to the overall concept of how Air Power will be used. If our strategy is similar to that which won the last war - instead of Major Alexander P. de Seversky's which visualizes a global striking force based in the United States—it could follow that our best bet is to concentrate on Alaska, which we presumably could supply, and learn enough to move to other portions of the Arctic when the proper time comes.

From bases in Alaska we can strike with B-29's, B-50's, and B-36's at most of the vital areas that belong to major powers. With refueling techniques, possibly all vital areas could be reached. Aside from Alaska there are other areas in the Arctic which could be used advantageously for attack or defense. Alaska is the only territory, however, which we own and in which we can experiment and gain the cold weather know-how.

To make Alaska usable to any large force, either air or ground, certain steps must be taken to prepare the territory for the effort. Some of these will be quite far-reaching in importance not only from the military point of view but from the viewpoint of Alaskans and certain vested interests in the United States.

In the past few years the Department of the Interior has drawn up a blueprint for the long-range development of Alaska's economic resources. In some cases portions of the blueprint fit into the plan for desirable military developments, but often there has been little correlation or coordination between the two interested agencies. As in so many instances in the past, the military may be hoping to exploit an artificial economic situation in a country without attempting to bolster civilian economy at the same time.

An excellent example of the manner in which this works is furnished by

RESTRICTED

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

the Alaska Railroad. Both the Air Force and the Army are interested in rehabilitating the antiquated roadbed and rolling stock of the line. Over $50 million have been appropriated by Congress for the task. Yet no adequate effort is being made to gear civilian economy to the newly developed potential of the railroad. Without sufficient cargo to make the line worth operating, it will relapse into obsolescence as soon as the military forces are reduced for a few years. If the territory becomes "hot" again, the job will have to be done over.

An alternative to this system would be the development of a plan for the economic, social, and educational advancement of Alaska, predicated on the grounds that a larger population would be an asset during time of war. The presence of large numbers of workers and adequate civilian housing would be a decided advantage during the initial stages of any struggle, particularly if operations started during the winter. The existence of already functioning supply lines would be of inestimable value.

To augment the population of Alaska to any considerable extent many ills that now beset the territory would have to be eradicated or alleviated. With outside stimulus these problems may be solved in a comparatively short time. Without such help progress may be slow or virtually nonexistent.

The biggest problem in Alaska, as in any Arctic area, is that of logistics. In the case of our largest air bases, supply depends upon three approaches—the Alaska Railroad, the Glenn and Richardson Highways, and the Alcan Highway. None of these three constitutes any great potential for supplying large forces and each would have to be improved in case of war. All facilities except the Alcan Highway are dependent upon west coast shipping which is peculiarly unsatisfactory at the present time.

Comparatively few lines are engaged in transporting supplies to Alaska by water. Since their ships come back relatively empty, freight rates for cargo going north are extremely high. Canadian ships are prevented from engaging in coastwise trade because of the Jones Act of 1920, which many residents of Alaska feel puts the ships operating out of Seattle in a monopolistic position.

As long as this condition exists, the population of Alaska cannot increase materially. To rectify the situation steps would have to be taken to (1) develop industry in Alaska so that the return ships would have cargo and (2) either remove the restrictions imposed by the Jones Act and allow Canadian carriers to participate in coastwise trade, or subsidize American carriers more liberally so that freight rates could be cut during the interim period. The use of Canadian carriers which would normally operate from Prince Rupert, British Columbia, would result in a 700 mile shorter haul.

Although such steps would help materially in the Panhandle and Anchorage regions, it would be only a beginning so far as the interior is concerned. Continued efforts would have to be exerted to foster improvement of the Alaska Railroad and to make the highway chain more serviceable. To increase carrying capacity and make the roads serviceable the year round, hard surfacing should be provided for all main roads and feeder systems. Similarly, the Alcan Highway should be hard-surfaced and

1506

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

provisions made to keep it open all year.

To augment further the transportation potential, serious consideration should be given to the construction of a railroad from Prince Rupert or Dawson Creek to Fairbanks. If the Canadian northwest could be developed at the same time, the railroad would provide low cost transportation which would be extremely helpful for both areas.

Products to be shipped over both land and sea routes from Alaska to the United States will probably come initially from government sponsored projects. An effort is being made at present to develop a paper-pulp industry in southeastern Alaska. Progress in the past has been hindered by red tape and the difficulty of determining aboriginal claims. Encouragement of the Department of the Interior to settle the claims without further delay would probably lead to numerous projects being started in Alaska which would mean the investment of millions of dollars in the territory.

Other steps to increase production would entail more extensive surveying of Alaskan mineral resources; the establishment of agricultural experiment stations to increase production; assistance in developing resort areas; and development of hydroelectric sites. All of these, however, are dependent first upon transportation, the great basic need.

Finally, Alaska should be assisted in reaching statehood. Attainment of this objective would not necessarily mean a solution to all problems, but it certainly would be a step in the right direction. Senators in Congress, who could trade votes with other Senators, would undoubtedly mean more prompt recognition of Alaska's needs. Benefits which accrue to other states, such as Federal appropriations for roads, would be available. The state legislature could attempt to find more adequate solutions to the problems of territorial finance and taxation. Absentee ownership and exploitation could be more easily controlled and stopped. Congress might be inclined to consider Alaska's application more seriously—if the military requirements could become better appreciated.

Since the USAF is the armed service most vitally interested in Alaska, that organization has a unique opportunity to promulgate and execute a well-planned program for both civilian and military development. Instead of building in a vacuum, why not build something lasting, an economic structure that will endure after the immediate need for the military forces has disappeared?

MILITARY FOUNDATIONS OF PEACE

American foreign policy seeks a durable peace and a stable world order. Realistic thinking agrees that this objective is surrounded on every side by military considerations.

The influence of military factors on world politics can not be realized without first considering the bleak history of warfare. There have been innumerable wars since recorded time. Since the rise of modern culture, wars have grown astronomically in violence and intensity. By every index, wars have increased in magnitude, and by every standard, the terrifying tax paid to Mars becomes more unbearable. In our twentieth century of progress, we have already fought twelve times as many battles as occurred during the ghastly 30 Years War. The actual duration of battles has increased from hours to weeks and months. The number of men engaged in conflict has expanded consistently. Proportional advances can be found in the number of men mobilized, fatalities, and per capita cost.

War is peculiarly a matter of vital concern to the Great Powers. Its major burdens have been increasingly borne by them. The Great Powers paid 90 percent of the world's armament bill in 1937, as well as most of the admission fee to the 1939-1945 hostilities. The Great Powers have been engaged in almost every battle fought in modern times. As a matter of fact, the Great Powers have become great by war and have maintained their position and influence only through resort to war. Up to the present time, history reveals that the decline and eclipse of a great power occurs when the nation in question grows pacifistic and refuses to defend its interests.

In the face of this trend stands the possibility that future war may sound the death knell for victor and vanquished alike. The contention is advanced by many that the very survival of our civilization depends upon humanity finding a method of eliminating war as the final instrument of international dispute.

If one looks objectively at the ascending curve of war frequency and the current allocation of treasure for military purposes, the chances of a permanent peace seem slim indeed. This deduction would be reinforced by two other disturbing characteristics of the world scene. First is the acknowledged and sharp ideological cleavage between East and West. There is scarcely a daily paper which does not carry some story of the conflict between these systems. To this situation, it seems appropriate to apply this observation of Justice Oliver Wendell Holmes: "Between two groups that want to make inconsistent kinds of worlds, I see no remedy except force".

Equally disturbing to the cause of peace is the shift in world power relations so that only the United States and Russia contain within their immediate spheres sufficient strength to wage modern war. Both of these titanic powers are compelled by the nature of separate sovereign existence to observe each other's conduct with discreet and watchful eyes. The United States and the Soviet Union stride the modern power heap in a manner reminiscent of the ancient rivalry between Carthage and Rome. The known Mediterranean world was too small for

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

both those powers. For this reason, some have alleged that the present world, stripped of the buffer service rendered by four or five now defunct powers, will be consolidated by force.

Fortunately, the picture can not be presented so simply. It is a fact that an ideologically split, bi-power world has rumbled on for several years without resorting to the violent form of conflict called war. On the other hand, few have been so rash as to describe the volcano on which the world is so precariously resting as a nesting ground for the dove of peace.

War weariness has been offered as the explanation for the truce we so anxiously enjoy. Doubtless, it plays a significant role in restraining conflict, but a deeper insight into the present absence of war can be found in the celebrated dictum of Clausewitz that "war is a continuation of policy." The policies of separate states, even the most peaceful, are always in some degree of conflict, and war is only the violent expression of conflict between diametrically opposite policies. From this point of view, which history substantiates, there never has been a peaceful period. There have been less warlike times and periods more warlike, but the underlying relationship between peoples has always been one of competition and conflict. Thus far, history reveals that the causes of war have been a permanent condition of human life. Rivalry over a wide variety of issues has always split the world into numerous opposing camps.

Aggressive governments have exploited this rivalry as the basis for war whenever it suited their policies. In a clash of policies, some governments seek to maintain their position. Others strive to advance their power position according to the dominant interest of the day, be it religious, economic, or ideological. Governments which pursue expanding policies are the aggressive governments. All governments, good, bad, or indifferent, have one trait in common; they are formed of men who desire and enjoy power. No timid, retiring violet ever became president, or dictator, or prime minister. The individuals who head governments have a power urge. Since the desires of the aggressor can be realized only at the expense of other governments, demands which require a diminution in national prestige and importance have never been accepted without the use or threat of force.

The expansionist policies of power-seeking men, fortified by their egoism, have been the basic cause of war. Actual wars are fought over concrete issues which mask the real reasons for their appearance. War-like periods generally coincide with periods of great change, or to use the Russian expression, in times of trouble. In the modern era, the aggressor has evoked war to destroy the balance of power or to export his domestic policies for foreign consumption.

Covering and obscuring the underlying causes of war is the minor detail of incidents. Incidents are really of little importance. Enough incidents have occurred during the last several years to have started a hundred wars during the reign of old style diplomacy. Similarly, incidents will occur or can be manufactured to provide the overt cause for any future war.

If the causes of war are permanent, and if incidents are frequent, why do particular wars break out when they do? The correct answer to this

1509

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

question is that wars never break out. Instead, wars are made. Wars are made by some ambitious, aggressive ruler, whenever general conditions lead him to believe he can advance his interests by war. A potential aggressor seeks a favorable opportunity, such as a political split between his prospective opponents or the acquisition of some knockout weapon which he believes will guarantee him victory.

It is a historical fact that no aggressor ever started a war which he was going to lose. The aggressor enters war to gain more power, not to lose what he already has. Many nations, in self defense have accepted war thrust upon them, knowing defeat to be inevitable, but no country has taken up the aggressor's sword without the firm conviction that it would be victorious. Every aggressor, down to and including Hitler and Tojo, has made war only after a careful analysis of the general military situation. The general staff of a potential aggressor constantly surveys the military strength of his intended victims. When these victims let their guard down, a new war takes its place in the history books.

The aggressor's military estimate need not necessarily be correct. His general staff may make a faulty analysis of a complicated military situation, as Hitler's and Tojo's evidently did. But their mistakes are beside the point. What is important to remember is that, rightly or wrongly, the aggressor willfully undertakes to make war only when he is convinced that he can win.

This fact, so boldly written in the pages of history, may enable America to lead the world to peace. The enormous cost and the immense resources which modern war demands permit the few remaining Great Powers to establish within the United Nations a reign of international law to which the lesser states must subscribe. Disputes between the lesser states can thus be arbitrated. Wars between the lesser states and the Great Powers are likewise unthinkable. The only danger to the peace of the world lies in the fact that there is no authority on earth which can force the major powers to settle their disputes except the mutual respect they have for each other's strength. Every experienced observer has commented upon the unconcealed admiration the Soviet leaders have for power. History has thrown the United States and the Soviet Union to the summit of world power simultaneously. Serious differences exist between these nations. These differences head some Americans to consider Russia as a potential aggressor. Need this fear lead to war?

The untold calamity of such a war can be prevented if the United States will continue to maintain sufficient military strength to convince the Soviet General Staff that war against us would be futile. If this strength were maintained for a sufficiently long time, ways might be found to settle some of the apparently insoluble difficulties that exist between us. Until the hope of a successful major war is eradicated from any possible aggressor's mind, the world may have to continue to put up with recriminations and name calling. But there will be little likelihood of overt war as long as our peace loving nation can flex a bigger muscle than any potential trouble maker. Common sense teaches that no weaker person picks a fight with a Joe Louis either in the boxing ring or in the larger arena of international affairs.

The military path to peace boils down to this: Prevent any potential hostile nation's general staff from

RESTRICTED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

ever making an estimate that the United States could be defeated. The United States can walk this path toward peace only if it is willing to maintain in time of peace forces capable of countering the blows of any possible aggressor. Our burden can be made easier if we can maintain an unbreakable association with like-minded nations - if possible, within the structure of the United Nations.

In the past, the American peacetime willingness to protect this nation has never been impressive. Until recently, our intellectual leaders have turned away from the military problems of defense in a manner reminiscent of the fabled ostrich. The opinions of American military men have been ignored. As a result, our defense measures have alternated between periods of total unpreparedness and times of frenzied and wasteful purchase of military might.

In 1937, 4 years after Hitler announced his plans of aggression, we had proportionately fewer men under arms than the 100,000 men which were authorized a disarmed Germany by the treaty of Versailles. That same year, the cost of our military establishment, including benefits being paid to World War I veterans, amounted to 1 percent of our national income. At the same time, the other Great Powers were expending 10 percent of their respective national incomes in preparations for war.

Under the special conditions of the immediate postwar period, a higher percentage of the American national income has been earmarked for military purposes. The military return of this appropriation has been considerably lessened by occupation and other non-military items charged to defense.

The USSR has been spending for military purposes approximately the same absolute amount as the United States. The military value of the Soviet expenditure has been increased by the low pay scales established for the ranks of the Red Army and the absence of occupation costs which have trimmed the other military items in our own budget.

If nations of approximately equal strength remain equal, there is no possibility of war breaking out between them. But if one of these nations invests, over a span of years, several times as much of its entire national effort into military forces as the other, a great disparity in strength will inevitably develop. Similarly, if one nation demands that all of its citizens be trained for war while the other relies on the inducement of decent pay to attract men into its Armed Forces, these two nations will pull further and further apart in relative strength. Somewhere along this easily discernible line, one power will become immensely strong in comparison with the other. If the stronger power happens to be pursuing aggressive policies, the fatal hour will come when its general staff will decide that a military victory over its rival lays within its grasp. If we ever permit this hour to arrive, the responsibility for war can be charged to American inability to read and react to history.

Eternal vigilance is the price of peace, more so now than ever before. To objective thinkers, a realistic program of matching strength to strength in order to guarantee peace makes sense. Yet, there are dangers to such a program. Unless we pursue it prudently, we face the possibility of an arms race which might be instrumental in forcing a war which our security measures are designed to prevent.

This vicious circle can be broken if the United States pledges to use its armed force for the only rational and moral purpose for which any force can be used: Self defense.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Power allied to moral purpose has never menaced society. In personal affairs, self defense is the first rule of life. In these affairs, a body of law has established the rule that the individual who commits the first overt act against another in a dispute is the aggressor. Mere preparation or mere words and threats never comprise assault - only the actual deed of violence does. If this simple test could be applied to international disputes, there would be chance of a durable peace.

A statement that American forces would never commit the first overt military act would cut the feet from those individuals who contend that necessary American military power is a challenge to world peace and is the main inspiration of the vast Soviet armaments. The United States is preeminently suited for waging a struggle for peace by renouncing aggression. The fact that our government operates within restricted constitutional powers would insure that a renunciation on our part of aggressive war would receive the enthusiastic and sincere support of peoples everywhere.

Such a declaration of national policy would contribute a refreshing moral advance to the confused standards of international conduct. It would be a clear refutation of those in our midst who have lost their sense of balance under the pressure of continuing world crisis. Overawed by the atomic bomb, frightened by the possibility of other novel forms of warfare, and fearful of threats against the United States, some of our citizens plead that the United States consider preventive war. These people reason that, because of the power of modern weapons, the next war will be won by the side that strikes first. This they advocate we do. Needless to say, acceptance of this scheme would speed the world along to that barbarism we hope to avoid. Hostile intent, our ostensible basis for fighting, could never be proved by our own moral standards, no matter what threats we receive. If such a preventive war brought us victory, the United States would stand before the world as a power-crazed giant, its title to global leadership irretrievably lost.

A policy of peace through American strength does not imply military isolation. Isolationism, if carried to its logical conclusion, would reduce the United States to a strategically indefensible position. It is important to realize that the defense of America embraces not only the defense of the land beneath our flag but also the defense of the idea that people who want to have a right to live in freedom.

The advent of modern weapons of destruction places a unique burden upon the people of the United States. Peace cannot succeed unless we continuously demonstrate the utmost determination to defend ourselves. Our planning for peace must not imply that we will lose an unwanted war.

The present period of international chaos may last indefinitely, boring more and more deeply into our nerves, our pocketbooks, and our good sense. We face the prospect of being the first target on some future warmaker's schedule. Despite the nature of modern weapons, the initial defense of an adequately prepared nation is not and will not be an impossibility. The last realizable chance to prove that right makes might in this world depends upon America's ability to absorb initial blows, to recover, and to strike back for ultimate victory. This proposed pathway to peace will be both difficult and exasperating, but it has the advantage of being the only one that can take us to our destination.

B-47 STRATOJET,

USING MORE POWERFUL ENGINES,

COMPLETES FIRST TEST FLIGHT

The USAF's Boeing B-47 "Stratojet" medium bomber completed its first test flight recently at Moses Lake Air Force Base, Washington using the newer, more powerful General Electric J-47 turbo-jet engines in place of its original General Electric J-35's.

Installation of the J-47 engines will result in a more than 25 per cent increase in thrust power for the six-jet,600 mile-per-hour-bomber with little or no increase in weight or fuel consumption.

As originally designed, the B-47 was powered by six General Electric J-35 turbo-jet engines rated at 4000 pounds of thrust each. These lower rated power plants placed the 125,000 pound, swept-wing bomber in the 600-miles-per-hour class and gave it a service ceiling of over 40,000 feet.

The J-47 engines which were used in the test flight are rated at more than 5,200 pounds of thrust each and identical engines will be installed in the production B-47A "Stratojets" now being built by the Boeing Airplane Company at Wichita, Kansas.

Newest USAF medium jet bomber, the B-47 last January flew from Moses Lake, Washington to Andrews Air Force Base, Maryland in three hours, forty-six minutes, an average ground speed of 607 miles per hour.

Continued from Page 12

importance are the number of men that can be drained off from the labor force for the armed services. These are but a few of the considerations in this particular aspect of manpower.

Basic population data are expressed by such factors as the total number of people, the size of the various age-sex groups, and birth and death rates. Such data are insufficient as a basis for the intelligence officer to estimate the military and industrial manpower potential of a country. In order to determine the ability of a people to produce goods and to fight, he must examine the public welfare program, the manner in which public opinion is molded, the moral fiber of the people, and lastly the relationship between labor and management.

THE FLYING BOOM

NEW "IN-FLIGHT" REFUELING SYSTEMS

A new "Flying Boom" in-flight refueling system - in which a B-29 tanker plane refuels the B-50 and B-29 bombers by means of a telescoping pipe has been announced by USAF.

In using the new technique, the two planes fly in formation and the controlled, telescoping refueling boom carried beneath the tanker plane is inserted into a special socket in the nose of the receiver plane and fuel is transferred under pressure.

It is expected that the new system, developed for the Air Force by the Boeing Airplane Company, will alleviate some of the difficulties of the existing method of gravity feed refueling through a flexible hose extending from the tail of the tanker plane to the tail of the receiver plane.

This flexible-hose method of refueling was used last February when the B-50 "Lucky Lady II" flew around the world non-stop while being refueled in flight by tanker B-29's at four points on its flight of more than 23,000 miles.

The new refueling device is called the "Flying Boom" and consists of a telescoping metal tube which extends from rear underside of the tanker aircraft.

For take-off and landing, the boom extends almost straight back from under the tanker's tail. Internal pumps, fuel lines and control details of the new air-to-air refueling device are classified.

The bomber receiving fuel has a special fueling socket in its nose, just forward of the upper top gun turret. The "Flying Boom" itself is equipped with small v-shaped control surfaces, known as "ruddevators", which control movement of the boom either up or down or to either side. A technician seated in the tail of the tanker "flies" the boom by operating the "ruddevator" controls.

The tanker and bomber must fly in a formation to carry out the refueling with the tankers above and slightly ahead of the bomber. The "flying boom" operator then "flies" the long telescoping fueling tube nozzle into the socket on the nose of the bomber, and fuel is then pumped, under pressure into the receiving airplane.

The new fueling system has been in flight test status since the summer of 1948 when first tests were made by crews from Boeing and the Air Force's Air Materiel Command at the Boeing Wichita Division, Wichita, Kansas.

The "Flying Boom," which is still classed as experimental, is designed to enable bombers and fighters of the US Air Force to refuel in the air at a faster fuel flow rate and at higher altitudes than heretofore was possible.

The U.S. Air Force is also experimenting with an aerial refueling system designed to enable fighter planes to be refueled three at a time from one tanker. Details of this system are classified.

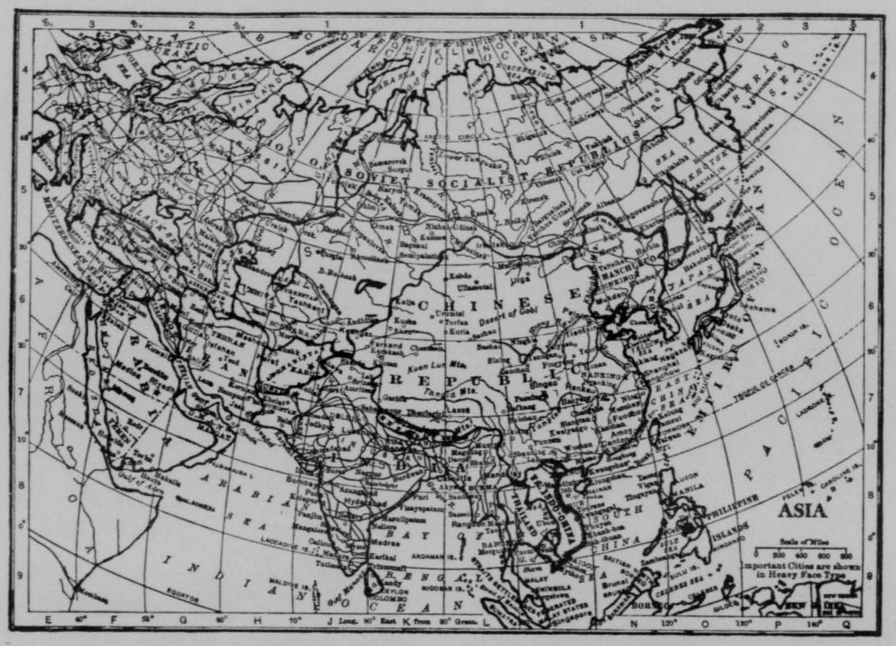
RUSSIAN THREAT TO THE INDIES

The Russian threat to the Indies is an old story, dating from the Tsar's occupation of Turkestan in the 1860s and the building of a strategic railway eastward from the Caspian through the cottonlands on the Persian and Afghan borders. It provided British India with an exercise of arms, diplomacy, and the Secret Service for more than 50 years. It is now one of the crucial problems of the postwar "succession states" and the dder states and dependencies in Indo-China and Indonesia. The threat now is no longer merely one of possible invasion but has taken on a new menace in the shape of economic disruption and political upheaval characteristic of the "cold war" in any part of the world. It has been extended by the approach of a communist China from the east.

In South Asia is a group of old lands with new governments. Three of them are dominions of the British Commonwealth-Pakistan, India, and Ceylon. The others include the British Colony of Malaya, newly independent Burma, and the old kingdom of Siam, French Indo-China, and, to the south, the Dutch and British



1516

THIS PAGE IS UNCLASSIFIED

East Indies.

From all of these, from time to time since the conclusion of World War II, have come accounts of disturbance, subversive activity, and civil war with which, in every case, the name of communism has been associated. Even if the Moscow government be not positively identified with these interferences with peace in Asia, at least, from what we know of its foreign policy, it cannot fail to be agreeably interested.

From late reports, it would appear that the offensive has failed - notably in India, Malaya, and Siam. It never amounted even to a threat in Pakistan and Ceylon. In Burma, however,the situation is still critical. This failure may be attributed to strong action and alertness on the part of the governments concerned, combined with a natural reluctance of the native peoples arising from the religious outlook and pastoral habits of the East. A feature of the struggle has been the activity of Chinese among the disturbers, at least in Siam, Malaya, Indo-China and Indonesia. The struggle began earlier and still continues in Indo-China and Indonesia, two territories in which the presence of strong armed forces of a western power provides rebellious elements with a lever in using nationalism to further their ends.

Russian Forces

While all these "front line" activities of the communist effort to dominate the East have been going on, there lurks in the background the Red Army of Central Asia. Successors to Tamerlane's legions in the fabulous East, Timoshenko's divisions stretch in a long crescent from the Caspian to the Dzungarian Gate, flanking Persia and Afghanistan with a strategic railway and probing the passes of the Himalayas.

Though largely desert and dry steppe or veldt, Russian Central Asia possesses a center of population, economy, and culture in the fertile irrigated lands around Tashkent, the eighth largest city of the Union with a population of 585,000. Tashkent is the headquarters of Timoshenko's Army Group, estimated at 30 divisions, each of about 10,000 men. This Group, like the Far East Group, is self-supporting with its own industrial installations. It is capable of fighting without logistic support from Moscow. The 30 divisions probably include 5 armored, 10 infantry (partly mechanized), 4 cavalry (horse and mechanized), and 4 artillery, with 7 air force and airborne divisions. Of the Soviet Navy, operations might involve the Caspian Flotilla in support.

These forces are situated in the most strategically secluded region of Russia with every sort of terrain available for practice and maneuver, including vast deserts for the secret trial of artillery and guided missiles or atomic projectiles. This accumulation of forces gives continued significance to the revelations, in the captured German Foreign Office records, of Soviet territorial aspirations in the direction of the Indian Ocean.

The Soviet Central Asia Army Group protects Russia's most important Siberian center of Industry, the Ural-Kuzbass combine, and what has been called the "armaments quadrangle," Baku-Terinsk-Stalinsk-Stalinabad.

In the event of war, examination of the topography of the surrounding countries will show that an advance east into China would be feasible. However, any move to the south towards the Indian Ocean and the Per-

1517

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

sian Gulf would be over rugged mountains, range after range, and through passes and defiles which could easily be held by small forces. It would be through territory deficient in food and other resources and almost entirely devoid of railways and any sort of good road, hardly passable even for combined ground-air forces. In addition, the limited administrative and supply elements of a modern Russian division, though making for mobility, would be a severe handicap to a southward move through the "bad lands" of Afghanistan and Persia. Nevertheless, both Tsar and dictator have pushed their own communications, rail, road, and air, to the very frontier at many points, even across arid desert and high into the mountains. Widely separated customs houses at Kushka, Kerki, and Termez mark the only roads into Afghanistan, which has no railways. The Afghan roads permit only tortuous and difficult contact with India.

RACIAL POLICY

In any invasion to the south, the opposition of the native tribes would be an important adverse factor which it would be highly desirable to eliminate. An attempt at penetration was made since the war in the Azerbaijan dispute, but it was abandoned. Any further advance into these territories would require careful "conditioning" and the absence of Western forces.

Mohammedanism may have something to do with the problem from the Russian point of view. It is significant that in the "Godless" state, where Islam claims more adherents than in any other country, the religion of the prophet has not been abolished or persecuted. Indeed, it was in the dealings of the early revolution with the Mohammedan peoples of Central Asia that the early discounting of nationality was abandoned. To counteract the influence of Enver Pasha in this area and to carry on the fight against the Basmachi, which was not concluded until the trials of 1936–1938, nationality and race were given recognition and made the basis of territorial divisions.

Stalin, himself a member of one of the Russian "nationalities," is officially regarded as the originator of the theory called "ethnic democracy" applied in governing non-Russians, at least in Asiatic countries. In 1920, in reference to this region, Stalin formulated the policy as follows: "In order to put an end to the estrangement of the border regions....it is necessary that all Soviet organs, the courts, the administration, the economic bodies, the direct organs of government – as also the organs of the party – should as far as possible be recruited from among local people acquainted with the customs, life, habits, and language of the native population...Only in this way can the Soviet government become dear to the toiling masses of the border regions."

In 1921, Stalin said: "The fact of the matter is that a number of peoples, mainly Turkish peoples – about 30 million in all – have not passed, have not had time to pass, through the period of industrial capitalism.....as a result, they will have to pass from primitive forms of economy to the stage of Soviet economy without passing through the stage of industrial capitalism."

These ideas have been noticeably developed in the communist activities in China, which has already been discussed as being the proving-ground for methods of dealing with Eastern peoples. The events in Southeast Asia during 1948 reveal an effort to make up in successes in the Indies for failures in Western Europe, Greece, Italy, France, and Berlin, and for the defection of Yugoslavia.

Educating the SOVIET ARMY OFFICER

In old Russia, the doors of the corps of cadets, the military schools, and the academies were tightly closed to workers and peasants. Military knowledge and military leadership were the monopoly of an exclusive caste. The corps of officers, especially the generals, was made up in the main of representatives of the gentry. In 1912, a large percentage of all Russian generals were members of the gentry, and the rest were scions of the upper middle class or of the clergy. Many generals and admirals belonged to titled European families, as princes, barons, and counts, of other than Russian descent.

Private soldiers were contemptuously referred to as "cattle" by their aristocratic officers. The private could not even dream of an officer's commission, no matter how capable. In the pre-revolutionary epoch, officers for the most part were promoted to higher ranks, not because they showed talent or had distinguished themselves in action, but because they had titles and money. The system which had existed in the times of Peter the Great and Suvorov, when officers' commissions were given to the most capable privates and noncommissioned officers, had long been forgotten.

The new Soviet general staff studied the weaknesses of the old Imperial Army. Discipline in the old army was such that a mass of men could be drilled in perfect formations, and it could make the formations appear, when led, like a precisely functioning mechanism. But few of the officers could read a map. Few officers had sufficient military knowledge to continue a skirmish on his own initiative. The educational level of the enlisted men was even lower. If an officer fell or was otherwise eliminated from the field of battle, his troops were lost.

Post-Revolutionary Period

During the years following the Revolution, attempts were made to remedy the above situation, but development of educational methods was slow and failed to follow a definite plan. The army, until it could grow together organically, had to undergo the same process as the rest of the country. Everything had to be built up on a new foundation, as Lenin and the revolutionaries were determined to destory all traces of the old imperial regime, and they were initially unwilling to accept anything faintly resembling the Russian Imperial Army.

The establishment of a stable military system finally improved internal conditions of the Red Army, and a period of far-reaching reforms was originated by Frunze, who rose from the ranks of the revolutionaries to become Trotsky's Commissar of Defense in 1924. During the next 3 years, Frunze greatly improved the officer's educational courses. The short-time command courses of the civil war era were supplanted by military schools with courses lasting from 2 to 4 years. The existing academies for higher military tactics were reorganized and enlarged, and new ones were created for the different

THIS PAGE IS UNCLASSIFIED

The main building of the Frunze Military Academy in Moscow.

branches of service. Thousands of the temporary civil war officers were sent to these schools for much needed training and refresher courses. The material conditions of the army were gradually bettered, while a new stress on discipline corrected the postwar laxity and enhanced the authority of the officers. Orders no longer had to be countersigned by political commissars, although these commissars were retained in the field for years as the authority on political education.

Throughout the whole army, but especially in the groups of officer cadres, class origin now played a decisive role. The majority of the old officers were mustered out, although over 4,000 were retained, many of whom were in high staff and command positions. To attain homogeneity in the army structure, cultural standards for officer candidates were temporarily lowered. This later had to be corrected due to the tremendous growth of the Soviet educational system.

Timoshenko's Reforms

In May 1940, the new Commissar of Defense, Marshal Timoshenko, inaugurated another period of reforms and drastic changes in training methods. The main reforms were toward improvement of tactical standards and leadership of the small units (platoons, companies, and battalions), and toward eradication of routine training methods, classroom instruction instead of field work, and excess paper work. Large-scale maneuvers were abandoned; they were replaced by tactical field exercises, using no units larger than a division.

World War II hastened the process of modernization of the educational system. The Soviet Army, lacking a Soviet tradition of sufficient depth to back up the efforts it was called on to make, invoked the military traditions of Czarist and pre-Czarist Russia. Generals, like Alexander Suvorov, who served under Catherine the Great, became legendary Soviet heroes. Guard units were created. More colorful uniforms, similar to those of the old Imperial Army, were adopted, with the same old shoulderboards. Army pay was adjusted to increase the differential between officers and enlisted men, and additional privileges were established.

Since World War II, the Soviet

1520

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

government has taken steps to increase the attractiveness of a post-war career for officers in the army. Once the symbol of despised Czarist oppression, the officers' corps has been gradually revived, and it now enjoys a firmly rooted authority based on the success it achieved during the war.

Officer's Life

In Russia, army officers are a privileged class in the literal sense of the word. Their privilege is not, as in many other countries, an irrational, immaterial sham, a glossed-over poverty, or a mere social glamor. All Soviet citizens are employees of the state. Among them, the officer is the best paid. But his pay is not the important thing, for even a well-paid Soviet citizen has a pretty difficult life. It is hard to find a place to live, to be properly clothed - in short, life is full of worries. The important point about the professional army officer is that he is relieved of all these cares. He has everything in his barracks (for everybody - even most generals - live in barracks). He has a comfortable apartment there; he is relatively well-clothed and fed; he participates in all kinds of sports, educational facilities, and amusements. The officer is perhaps the only Soviet citizen who has no cares. All that the state expects in return is study. When duties are over, he must attend lectures, exercises, and seminars. If he wants to remain in the army, he must, every few years, pass an examination in some language or in a more intensive mastery of military science. He is also expected to increase his general knowledge constantly - this, of course, strictly within the framework of the dominant political faith.

The career of the professional officer is strictly prescribed. The privileges attached to a military career provide a wide and careful choice of candidates. Only the best high school students are eligible for the military schools, and these must, at the same time, be especially recommended by the Party. After 3 or 4 years training there, while almost cut off from the world (or, more correctly, in actual daily but closely controlled and supervised contact with it), they enter the army, are transferred to outlying garrisons of the vast Soviet area, and become completely swallowed by military life.

It is a peculiar accomplishment of Soviet organization that it leaves to the officer not a single minute of personal life, not even with his own family. For his family also lives in the barracks and is a member of that "family" which is the Soviet Army. As such, his family partakes of the communal living arrangements of the regiment and belongs to most of the clubs and social organizations of the troop units. This participation is officially a privilege, but in reality a duty. The officers' wives, even when they have their own professions, are given functions in the community life. Large congresses of commander's wives are held in which these functions are discussed. They take an energetic part in military sport; commanders' wives have achieved records in shooting, skiing, and in cross-country rides.

The absorption of the officer's family into military life closes his last loophole to the outside world. He belongs entirely to the state. He is patriotic, but his is a singular patriotism, for it includes the ideal of world communism.

The military schools and academies are the pride of the Red Army. In equipment and training systems, they

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

probably rank among the best in Europe.

Suvorov Military Schools

In 1943, a decree created the Suvorov Military Schools for the purpose of training army cadets. Originally, there were nine such schools provided for, in towns of regions liberated from the Germans, but by the end of the war there were 15 schools. These "Suvorovtsi", as the young cadets are called who successfully complete the 7 to 9 year course, are allowed to enter the military schools for army officers without taking the regular entrance examinations. The Suvorov Schools accept candidates between the ages of 8 and 13; however, the average age upon entrance is 10. The candidates are chosen from among the orphans of Red Army heroes and from sons of high officers and ranking party officials. A few older youths who distinguish themselves on their own are also admitted. The schools are not open to the general public. So great is their popularity that there are a hundred times as many candidates as can be accepted. They are boarding schools; the state furnishes everything, including the uniform of black, topped off with the special white crowned hat. The cadets live under strict military discipline. Uniforms are worn in classes and on the street, the day begins and ends with bugle calls and the military forms of address are compulsory.

Red Star, the Soviet Army periodical, states, "The Suvorov Schools carry out the best traditions of the old establishments, where many celebrated officers and generals of the Russian Army began their careers. The curriculum also closely recalls the famous Tzarist cadet schools. Music, fencing, riding, dancing, physical culture, and drill are part of an enlarged curriculum". The directors of the Suvorov Schools are regular army major generals and the separate cadet companies are commanded by lieutenant colonels or majors.

In 1941, there were approximately 76 branch schools and now there are believed to be more than 100. The scope of their instruction appears to be a combination of our own branch schools and the United States Military Academy. These schools graduate annually about 10,000 new junior lieutenants after the successful completion of a 2-year course.

To qualify for attendance at these schools, the prospective student must have completed the tenth grade (high school in the USSR), must pass a mental and physical examination, must be unmarried and between the ages of 19 and 25. Any young man who aspires to a commission in the army may make application either to the commandant of the school he desires to attend or to the military commissar of his city or political district. If he is a non-commissioned officer in the army, he applies to his commanding officer. Upon graduation, he is sent to troop duty. From this point on, higher military education is by selection only. However, if he is ambitious, he may take extension courses from the correspondence branch of the school of his army. These are similar to our own extension courses.

After an officer has served with troops for at least 1 year and has been commissioned for at least 4 years, and before he passes his 35th birthday, he is eligible for selection to attend the academy of his branch. The courses at these academies represent a combination of those of our army advanced branch schools and the Command and General Staff College and are 3 to 5 years' duration. Graduates are assigned as commanders of battalions or regiments. At the beginning of the war, there were 16

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

schools in existence, but there are possibly two or three more by now. The academies not only train officers but also take an active part in research and development. They also publish arm and service journals, in which information on new tactical and technical developments is disseminated. As mentioned above, of particular importance is their function of conducting and supervising the correspondence courses for officers on active duty with troops. This has been of considerable significance in raising the standards of officers of the arms, large numbers of whom have received their training for higher command duties in such courses.

Among the branch schools are the Artillery Academy, which trains both line commanders and artillery experts; the Air Academy; the Military Engineering Academy; and the Stalin Military Academy of Motorization and Mechanization, which is one of the youngest of the branch schools. The latter was founded when the successes achieved in the industrialization of the Soviet Union made it possible to supply the Red Army with modern combat tanks and trucks of domestic manufacture. The Academy developed with the expansion of the Armored force. Eighteen years ago, it had only two laboratories and those were poorly equipped. Today, it has 40 to 50 laboratories with excellent up-to-date equipment.

The Frunze Academy

The Frunze Adacemy is the oldest high-level military educational establishment of the USSR. Outstanding officers who have served from 4 to 6 years with frontline units of the Red Army, possess a secondary school education, and have a knowledge of either English, French, German, Polish, Japanese, or Persian are eligible for selection to the Frunze Academy. However, all candidates must pass an entrance examination. Officers sometimes spend several years preparing for these examinations, which cover tactics, Soviet Army regulations, topography, and general education. Candidates are given 1 to 2 months leave for final preparations for the examination. Preliminary examinations are usually given at the military district headquarters by Academy representatives, and papers are forwarded to Moscow for grading. Candidates take their final examination at the Academy, where they also must appear before a special commission which thoroughly examines their political background.

The course of the Frunze Academy may be compared to that given at our Command and General Staff College. However, it lasts from 2 to 3 years. Studies are pursued under the direction of various departments, such as the chemistry and physics, military history, tactics, general military education, and intelligence departments. The first year deals largely with the tactics and techniques of the various arms. This is supplemented during the summer months by field exercises. A very interesting fact is that the intelligence course lasts 3 years, whereas most of the others are only of 2 years duration.

The Frunze Academy is equipped with more than 100 laboratories and indoor ranges. The laboratories include equipment for the study of aviation, chemistry, artillery tactics, strategy, military history, mechanization, motorization, camouflage, electronics, searchlights, and hydro-technics. Indoor ranges include ranges for field artillery, antiaircraft artillery, machine guns, and aircraft armament.

Since World War II, all students have been participating in the conduct of research, assisted by the faculty. The lessons of World War II are analyzed and studied, and instruction is based largely on lessons learned in combat. The Academy

1523

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

has a special museum for the history of World War II which is displayed graphically. A series of bi-monthly conferences is conducted on major operations. The transition from defensive to offensive strategy and the pursuit, encirclement, and destruction of enemy forces, from the campaign of 1944 are being studied at these conferences.

The objective of the Academy is to prepare graduates for duty as division commanders and the staff of corps or higher units. After graduation from the Academy, the officer is assigned to field duty. If the officer displays unusual ability in military science, he may be selected to remain at the Academy for research work or duty with the faculty.

General Staff Academy

The highest school for officers of the Red Army is the General Staff Academy or the Voroshilov Higher Military Academy. This Academy prepares senior officers for duty as corps chiefs of staff or higher duty. Although there is no age limit for admission, young officers of exceptional ability usually are selected. The course lasts from 2 to 3 years, with 100 officers in each year's class. Another hundred officers attend special classes designed to improve the general and military education of the officers of the Soviet Army. Thus, 300 students are attending this Academy each year. The Voroshilov Higher Military Academy may be regarded as similar to our own National War College.

The curriculum is prescribed by the Chief of the General Staff, and it generally includes the tactical, operational, and strategic employment of large formations. The course of the special class is similar to that of the regular class with fewer theoretical problems and no field problems. The methods of instruction employed are individual and group solution of assigned problems, lectures, panel discussions, and field exercises. The field exercises are conducted during the summer season. They consist of command reconnaissance of terrain; the tactical or operational decision of the commander; theoretical solutions of the resulting staff and logistical problems; and participation in command or staff functions during the fall exercises of the field units.

The candidates for the regular course must be graduates of the Frunze Academy and have at least 2 years' experience as commanders or staff officers of large units. The candidates for the special class need not be graduates of the Frunze Academy.

In addition to its regular instructional functions, the school conducts extensive research on military subjects. This research also results in the basis for articles published in the Journal of Military Thought, the journal of the Academy.

Conclusions

World War II has shown that the Soviet Army has large cadres of efficient commanders and leaders of men in the field. Many Soviet officers have been through the school of hard knocks in the past few years. Some fought in the Civil War and in the Finnish Campaign in 1939. Others - the overwhelming majority - received their baptism of fire on the battlefields in the war against the Germans.

Since the war, the Soviet Army's educational system is continuing to maintain and raise its professional and technical standards and is helping to overcome the effects of demobilization. It is easy to see that the system is organized on a basis unsurpassed by any other nation and that no signs of easing or letting up have been indicated.

POLAR GUIDE

This is the Fifth in a Series of Chapters on Arctic Indoctrination

Chapter XIV - Preparation For Flight

Polar operations require considerably more preparation for flight than operations anywhere else in the world. Not only must you prepare the airplane and the accessory equipment for proper functioning under special conditions, but you must also prepare yourself for any emergency. If the flight is not properly planned, the mission may be doomed to disaster even before the plane leaves the ground. If you are not prepared for emergencies, even a well-executed crash landing may really be the beginning of a long, slow funeral.

Before take-off, be sure to learn the location of inhabited outposts, emergency cabins, or other shelters, and the whereabouts of crash boats and patrol vessels. Know what rescue equipment is available and what the established search and rescue practices are. Ascertain the proper procedures in foreign territory from your Intelligence Officer. Learn the distress, bail-out, ditching, and crash landing procedures as prescribed by your training and briefing officers. Be sure you know. Don't guess. It's your life.

Polar operations also require careful planning and scheduling of pre-flight ground activities. Arrange the periods of pre-heating so that all equipment will be inspected, warmed, ready, and operating at the time of starting engines or take-off. While necessary pre-heating is taking place, ice and snow should be removed, inspections and operational checks made, electronic equipment warmed up (with external power source connected, of course) and other necessary activities conducted. In general, maintenance crews must know the overall time (including time for pre-heating the heaters) required for preparing the airplane for flight at any given temperature. Similarly, there must be thorough coordination between the Engineering and Operations sections so that there will be no costly delays between the conclusion of the pre-flight and take-off.

Personal Care

The importance of the proper care of your person in the polar regions has been stressed in many places in this guide, but here are a few additional suggestions for your personal comfort and safety.

Many different kinds of polar flying clothing have been devised. Naturally, you will wear what is issued, but, in general, be sure you have the proper clothing to keep you warm in case of a crash landing. Wear a parka, an intermediate jacket, flying trousers, mukluks, and the proper glove and sock assemblies. Dress for the worst possible conditions, not the best. An electrically heated flying suit is very fine in the plane, but if you crash land, it's pretty hard finding a place to plug it in.

In addition, remember the effect of cold metal on your skin. Wear gloves, of course, but just to make

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

sure, wrap tape, cord, or cloth muffs around control sticks or wheels, throat and hand mikes, and any other parts you might have to touch.

Keep out of prop wash. The blast can cause severe frostbite in the polar regions.

Weather

Flying in polar weather is difficult and taxes your instrument flying ability and your knowledge of weather conditions to the utmost. Nowhere else does the success or failure of your mission depend so much on your judgment. However, according to bush pilots who have studied and flown polar weather for years, you can master the technique if you follow a few simple directions.

Review everything you ever knew about meteorology, and then learn some more. The most important document you will ever see during service in the polar regions is a weather map. Fifty percent of a successful mission involving bad weather is accomplished on the ground. So work out the entire flight on paper, taking into consideration the conditions at destination, alternate airports, route weather conditions, available aids to flying along the route, time element, load conditions, and your ability to execute the job. Figure on a fair margin of fuel supply and load. Know the limits of your airplane and instruments in weather conditions. However, do not try to gage the weather too closely.

In general, the number of clear days among Alaskan bases is seldom over half the total number and often less than one-third. Nearly all bases, except in the interior, average more cloudy than clear days in the course of a year. The Aleutians, the southeast coast, and Seward Peninsual experience their best flying conditions during the winter, whereas the Gulf coast and the interior have their best flying conditions in summer. The best flying weather for all Alaska occurs in the interior and the parts of the Gulf coast which are well protected from the maritime influence, such as the Anchorage area.

Judging by ceilings and visibilities, the poorest flying conditions exist in the Aleutians and southwest regions. The ceilings and/or visibilities are below 2000 feet and/or 6 miles a little over 10% of the time (annually) in the interior and Anchorage area, and over 50% of the

	% of Time Ceiling and/or Visibility was below					
	1000′ and/or 3 miles			2000′ and/or 6 miles

Typical Flying Conditions in Alaska.

1526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

time in the Aleutians and southwest coast.

Notethe brief comparative summary, shown above of the flying conditions for the various parts of Alaska, as observed at the bases indicated.

Thus, generally speaking, the weather is bad as compared to Zone of Interior conditions. Nevertheless, it is flyable if the airplane and crew are prepared for it. This means airplanes in good condition, fully winterized, with deicing and anti-icing equipment, and with radio and electronic aids for navigation and low approaches. It means also pilots well-indoctrinated in instrument flying, including navigation, letdown and low-approach.

Airplane Check

The particular items that need to be checked in the pre-flight inspection of the airplane are covered in Chapter 10. Here, however, are a few special precautions you must take just before the flight.

Clear all frost and snow from the surfaces of the plane before take-off. Even a very thin layer of hoar-frost an eighth of an inch thick will alter the take-off characteristics of your plane. Loose snow will not blow off during take-off and may cause you either to stay on the ground until you reach a dangerously high speed or worse still, to stall during the initial climb. Remember, the thinnest film of ice forms a base upon which more ice can and will form rapidly.

Frost will usually form on the windows wither during engine warm-up or when you enter the plane. Remove this frost by blowing hot air into the cockpit through a heater duct or by using alcohol, gasoline, or copper or steel wool. However, do not use copper or steel wool on plastics. You can keep windshield frost down to a minimum by sitting well back and not breathing directly on the windshield.

Inspect all main and auxiliary control hinges and surfaces for particles of ice or hard snow that might cause jams. Check all controls to insure free and easy movement and full travel without blockage. Also check the pitot heat control and make certain that heat is available for the windshield.

Emergency Equipment Check

Check all your emergency equipment before starting out on any flight. You may find an important item missing, perhaps the very item you will need if you are forced down. Check also to make sure that the parachute harness fits properly over the clothing you're wearing at the time. Different adjustments may be necessary for different missions.

Store the emergency equipment securely in an easily accessible place so that it can be removed rapidly in an emergency. Make the lashings simple and anchor them by small loops of rope. This makes it possible, in an emergency, to cut the loops, remove the equipment quickly, and preserve the main rope for later use.

The standard emergency kit is the E-18. One of these kits is supplied for each three men in the airplane up to a maximum of three kits per plane. The E-18 is a basic emergency kit which contains supplies for emergencies anywhere in the world. To make it applicable to the polar regions, replace the items in the kit that are not appropriate for cold-weather survival with such items as

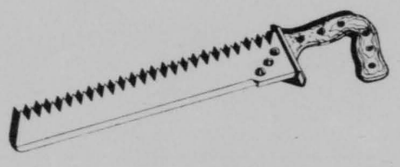
1527

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED



Ice-saw Snow-knife.

you will need. For example, replace the machete with an ice-saw snow-knife made up as illustrated. It is good for digging snow caves as well as cutting ice blocks, or sawing driftwood or forzen timber. In winter, also replace the gloves in the kit (which are really for protection against mosquitoes) with the glove assembly for cold-weather wear. Similarly with the other items in the kit - take along such as are most useful in the region over which you are flying.

Wear a C-1 or C-2 emergency vest. Here, too, replace or supplement particular items according to the season of the year and the region over which you are flying. Check with your Personal Equipment officer as to the best things to take along.

Take along one or more barren land tents depending on the numberof persons aboard. These tents, which even inexperienced personnel can erect easily, each accommodate three or four men and can withstand winds up to 100 mph.

If conditions permit, it's a good idea to take along also an E-12 kit, normally carried by rescue planes. This will provide you with many items you will find useful in case of an emergency. If you can't get an E-12 kit, be sure to take along extra clothing, sleeping bags, emergency rations, and the like.

When flying over regions where mountains and glaciers are widespread, carry crampons;snowshoes; packboard, one for each two men; blankets; a plywood sled with collapsible runners; rain suits and shoepacs for summer;windproof parka and trousers; extra mitten shells; manila rope, 120 feet for each four men; ice ax, one for each four men; tarpaulin; and extra gasoline cooker (for heating shelter).

When flying over water areas also carry anti-exposure suits,Mae Wests, life rafts, and life raft kits as emergency equipment.

Even in a fighter, you can carry some emergency equipment. Seat and back packs to hold the maximum amount of survival materials compatible with cockpit space are being developed. These packs will probably not come filled with pre-selected materials. Instead, the various kinds of survival equipment will be available in supply, and (unless there is a local regulation stipulating what should be taken) it will be up to you to select the items you deem most important. Be sure to take along as much as you can. In some fighters, a shelf of sheet steel has been built into the rear of the canopy for emergency supplies. If at all possible,have such a shelf built in your plane. You can hold the emergency equipment in place on the shelf by placing the bed roll in front of the smaller articles.

At present, some fighter pilots are working out arrangements to carry blankets or a sleeping bag on their backs. However, research is progressing in the development of a compactly packed sleeping bag that can be put into a seat or back pack.

Chapter XVI - Navigation

Problems

Navigation in the Far North falls into two categories - navigation in the continental areas (as in Alaska and Canada), and navigation in the polar regions proper (as over the ice pack above the 75th parallel). The first type of navigation - that is, in the continental areas - is practically the same as in the States. Of course, changes in variation and longitude are proportionately greater, but anyone competent to navigate in the States can do so in the continental areas of the Far North. In fact, many flights are made daily between such points as Fairbanks and Nome, and Anchorage and Adak, without any navigators at all.

Flight over the polar ice pack, however, is another story. There, because of the difficulties involved in maintaining and measuring courses and doing dead reckoning, you will have to resort to all the tricks of the navigator's trade. While it does not require knowledge of any new principles, it's quite a detailed

1529

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

job, and most polar flights carry three navigators who are kept busy more than 90% of the time performing the great variety of necessary tasks.

One of the navigators maintains DR, keeping up the log and charts. He receives most of his information from the other two navigators, but does his own sighting for celestial. A second navigator watches the scope making wind runs and obtaining radar fixes. The third navigator is the astro-navigator. He does the computations, sighting, and logging for the astro-compass. To vary the tasks and minimize strain, these navigators switch jobs about every hour. The logging procedure varies with the squadron, but in general, because of the frequent shift in navigators, you must maintain the log with all the precision you used when you were an eager cadet.

Measuring Courses

Measuring courses in the standard latitudes (0° - 60°) is fairly simple, for the meridians provide ready references for measuring course angles. If you tried the same methods in the higher latitudes, however, you would find that, due to the convergence of the meridians at the Pole, the course would change rapidly. For example, heading east or west at 75° N latitude, the course would change 1° for very 15 nautical miles. At higher latitudes, the change of course would be more rapid. If the course crossed the Pole, you would be even more baffled. At the Pole, there would be only one direction - South. But which way would not be south?

Maintaining Course

Maintaining course is not particularly difficult in the lower latitudes. After establishing true course, all you need to do to maintain this course is to apply magnetic variation, compass deviation, and drift (wind) correction to the compass heading.

Maintaining course when flying in the higher latitudes is quite another matter. In the first place, so many and so rapidly changing are the magnetic irregularities that the magnetic compass is practically worthless. In the second place - and this is more important - in polar navigation you are so close to the magnetic reference point (magnetic North Pole) that even if the magnetic field were perfectly regular you still could not use the magnetic compass effectively.

Dead Reckoning

With the magnetic compass useless, with course direction changing rapidly, with visibility frequently zero, and with landmarks few and far between, it takes complete coordination of all navigational procedures to determine ground speed, drift, and position. Dead reckoning in the polar regions is therefore an involved and arduous task.

Solution

Obviously, since polar flights are an almost daily occurrence, there are practical answers to all the problems of polar navigation. The two items that are different about the way navigation is handled in the polar regions are the use of a grid system to eliminate the difficulties caused by the convergence of the meridians and the use of the gyro compass as the basic directional instrument in place of the magnetic compass. For the rest, polar navigation requires only thorough planning, careful logging, and efficient utilization of radar and celestial

1530

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

procedures.

The "G" System

The "G" system is the directional reference system that simplifies high latitude navigation and alleviates its numerous uncertainties. This system has worked effectively for quite a while now in polar navigation.

The grid system substitutes a grid for the meridians and parallels of the aeronautical chart and grid directions for geographic directions. Make the grid by first drawing a line along the 0 and 180th meridians and marking the direction away from the Pole along the 180th meridian as "grid" north. Then draw a series of lines on the chart parallel to this meridian. Consider each of these lines as "grid" north-south lines. Using the same spacing, draw a series of lines perpendicular to the "grid" north-south lines. These will help you in measuring and in celestial. When you finish the grid, your chart will look like the illustration below.

Now compare plotting and logging a flight on a standard chart and on a "grid" chart. Using the standard chart, there is a continual change in the course heading which complicates every factor that has to be taken into consideration in navigation. Using the "grid" chart, the course heading remains constant. Similarly with wind. On the "grid" chart, wind azimuth is always the same as wind direction, and when the wind is constant, wind azimuth is constant. Thus, the "G" system simplifies most of the navigational problems in the polar regions.

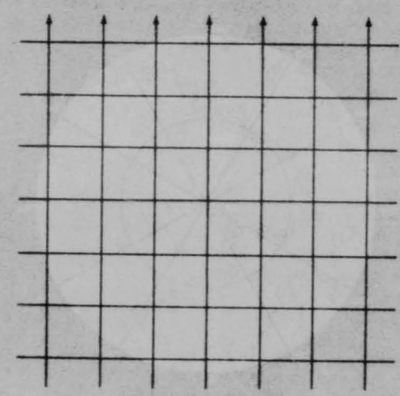
Directional Gyro

Just as the "G" system helps solve the problem of plotting course in the polar regions, so does the directional gyro help in maintaining courses there. It is not affected by magnetism and is so constructed that, with due correction for precession, it will steer a true line in space. Consequently, it is free from the difficulties besetting the

Convert true direction to "grid" direction as follows:

True Direction + West Longitude = "Grid" Direction.

True Direction − East Longitude = "Grid" Direction.



THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

magnetic compass and provides a practical instrument for maintaining course in the higher latitudes or polar regions. The most important procedure with reference to the gyro compass is, of course, correction for precession.

The value of this precession rate is not absolutely constant throughout the mission. Instead, it is subject to random fluctuations about a mean value, as well as to a small variation due to changes in latitude.

Of the two errors, the random changes are the greater and the more erratic. For gyros now in use, the standard deviation of these random changes over a 10-month observation period is approximately 2°. Thus, you should not take errors of this order to indicate an unreliable gyro.

While better gyros are presently being developed and should be available in the future, it is believed that there will always remain the necessity for accurately logging astro-compass and gyro information for the determination of precession rate. To date no official form has been established for logging astro-compass and gyro performance data, but the squadrons operating in the polar regions have developed their own form of a log and procedure to follow in order to reduce the labor of determining and applying the gyro precession rate and to provide a record of gyro performance which may be used with fair reliability if an overcast prevents further astro-compass checks of heading.

Mission Planning

Because the areas over which you fly in the polar regions are generally devoid of navigational aids, landmarks, and emergency landing fields - and because of the vast amount of work that must be done by the navigators during flight - it is particularly important that you prepare a thorough and complete plan for each polar mission. In addition to the things you would normally plan for in a flight, you must prepare in advance such things as the azimuth and altitude of good stars. Plan, for example, on the time to switch from using tables to using the Pole as the assumed position in obtaining celestial LOP's. It's a good idea also to plan for meridianal altitude shots to save yourself time and trigonometrical solutions.

Above all, plan your flight so that, during twilight, you will not have to take any important celestial shots, such as those involved in a radical change in course, determination of gyro precession, take-off, or approach the home base. Having made your plans, see that you stick to the time schedule closely enough to avoid the necessity for celestial shots during the twilight period.

Dead Reckoning

In the polar region, as in any other region, dead reckoning is the foundation of navigation. The big difference in the polar region is the necessity for the continual use of radar and celestial in order to keep DR navigation accurate. Naturally, you must keep a detailed and accurate log in order to derive full benefit from these procedures. Furthermore, since the primary purpose of most flights over the polar regions is reconnaissance, detailed and accurate logs are needed in order to evaluate properly all other records of the flight. Thus, the fact that successful observations or photographs were made during the flight will mean little at the end of the flight unless it is possible to determine accurately the position of the plane at the time of the ob-

1532

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

servation or photograph.

Celestial

Polar celestial is like celestial anywhere else, in that there are many ways of obtaining an LOP. HO 230, which is similar to the HO 218's here, makes it possible to shoot and solve for as low as 1° of altitude, which is excellent for the polar regions where the sun is at low altitude much of the year. In addition, the American Air Almanac now has polar sky diagrams, which give the approximate altitudes and azimuths of the planets, the moon, and the most important stars. Tables are available to supply plotting corrections for shots when the Pole is the assumed position.

For quick LOP's, meridianal altitude shots can be used. Above 80° N you can shoot them when the LHA of the body is within 30° of your meridian, provided the altitude is below 20°. For shots between 20° and 50° altitude, you must choose bodies with an LHA less than 20° from your meridian.

Corrections are about the same as anywhere else, but two types of corrections are quantitatively greater- the correction for refraction (on shots), and the correction for Coriolis force (on LOP's). Be sure to apply them properly.

You need not worry too much about the lack of celestial bodies for observation. Even during the period of daylight, which lasts for six and one-half months out of the year, there are generally one or two bodies available for observation - the sun and the moon -which should give sufficient information for LOP's and steering. The moon is available for approximately two-thirds of the time. Although the sun is visible continuously in the summer, there will be times when its altitude remains very low. During these times you may still use some LOP's provided you apply proper corrections for Coriolis force and atmospheric refraction.

During the three months of continuous twilight (sun not more than 18° below the horizon, yet not visible above the horizon), there is only one good body available for LOP's and steering - - the moon - and - then it is not present continuously. During this period you may also use the brighter planets for LOP's, but they are difficult to see because of the refracted sunlight. If you are careful you may be able to locate and use the brighter stars, pre-computing the azimuths and altitudes before trying to shoot these bodies. (Daylight sextants will be available soon).

Total darkness exists for about two and one-half months of the year. During this period, of course, celestial is at its best and a real boon to the navigators.

Radar

Radar is the chief source of DR information in the polar regions. When undercasts make pilotage and drift readings impossible, or when overcasts prevent celestial shots - and both conditions occur frequently over the ice pack - radar comes to the rescue. It allows you to "see" the ground in the heaviest undercast and, if there are landmarks, enables you to obtain a fix regardless of how much of the sky is covered.

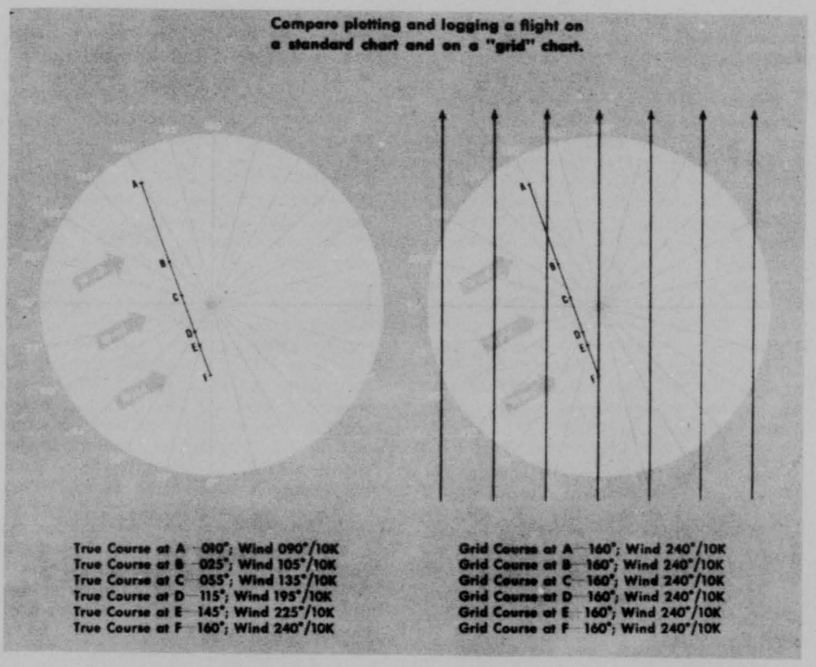
The procedures for using radar in pilotage, wind runs, and fixes on landmarks are, of course, the same as the procedures without radar, except that you observe the scope in-

1533

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED



stead of the ground and that you can see much more on the scope than with the unaided eye. As for fixes based on beacons, radar is simple. A number of X-band radar beacons are already set up in the Far North and more are planned. With these radar beacons you have to receive only one to get a fix. Giving coded returns for identification purposes, they respond to radar search sets of the APS-10 type as well as to sets like the APQ-13 and APQ-23. The distances at which you can receive them depend on your altitude - their range is the line-of-sight distance. The X and S-band beacons, together with their location and identification, are listed in CCBP-13, Racon List, which you can get from your Communications or Briefing Officer.

Radio

Loran stations are gradually being established throughout the polar regions. A chain of standard-frequency Loran stations centered about the Aleutians, with a range of about 700 miles in the daytime and 1400 miles at night, is already in operation. In addition, three low-frequency Loran stations have been established near Pt. Barrow, at Victoria Island, and at the mouth of the Mackenzie River. Except along the base line extension, they have a fairly reliable coverage up to 1000 miles of

1534

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

the more distant station of the pair you are receiving. You can receive both the standard-frequency and low-frequency Loran transmissions with either your APN-4 or APN-9 set, provided it includes Coverter CV-27. More Loran stations are being planned, and as the Loran chains are flight checked and become operational they will appear on the Loran charts which you can obtain through the Aeronautical Chart Service.

Pilotage

You cannot rely much on pilotage in the polar regions. The maps are constructed from very sketchy data, especially in the interior of land areas. The coast lines, fjords, and river mouths are generally reliable, but mountains are inaccurate in location, shape, and altitude - be careful to clear any possible mountains. Rivers and lakes are generally inaccurate, particularly in the inland area. Terrain features are very scantily sketched, many large areas being described only as "gently rolling land", "tundra", "Arctic waste", or "glacial".

Much of the land in this region is void of distinct landmarks, hampering attempts at pilotage. Although the coast lines may be very accurately charted, extensive areas of fast ice may alter their appearance sufficiently to render them unrecognizable. Such shore ice formations, especially when near snow covered coastal lands, make it extremely difficult to identify the actual shore lines. It is then safer to fly farther inland, where the more prominent terrain features may be revealed.

Visibility is often restricted by low clouds, blowing snow, and fog. Blowing snow seldom reaches altitudes of over 2000 feet, but when it occurs you must resort to means of navigation other than pilotage. Fog generally exists over the coast lines when the wind is blowing in from the sea and over the open sea when the air mass is cooler than the water. Under these conditions, continue on course, as the fog areas are generally of a local nature.

The polar regions however, are not entirely disadvantageous with respect to pilotage. Pitch darkness is seldom encountered except over large areas of open sea. In the summer, there is abundant daylight with long twilight; in the spring and autumn, there is nearly continuous twilight. Though direct sunlight is absent in these regions in mid-winter, the ground is usually covered with snow, and the refracted light from the atmosphere makes it possible to see dark objects at considerable distances. The moon aids visibility during these periods of darkness so that pilotage, although difficult, is not impossible.

Sky maps are polar phenomena which can be helpful if properly interpreted. A uniform overcast with clouds at a very high level reflects the surrounding terrain. Areas of level ice uniformly covered with snow show up as uniform white on the sky map. Broken surfaces, such as pressure ridges, pack ice, and drifted snow areas are indicated by grayish patches on the sky map. Open water, timber, and snow-free terrain show up as black areas in the cloud reflection. A careful study of the sky map may frequently help you determine the proper direction to reach open water, snow-free areas, or heavy timber.

You can determine wind direction over snow covered areas by reference to sastrugi. These are ridges of hard-packed snow, a few inches to two or three feet in height, which

1535

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

always develop with an axis parallel to the prevailing wind direction. The sastrugi also give possible reference points for reading drift and checking ground speed by timing. Over open water areas, you can read drift from floating ice, ridges in pack ice, or white caps.

Instruments

No matter how good your methods and careful your computations, they can be no better than your instruments. Take good care of them. Electrically heated flying suits affect direct-reading aircraft compasses principally because of the single-wire direct-current supply on which these suits are operated. Before taking off on a mission on which electrically heated suits will be used, swing the compass with all electric circuits and all suits, except your own, switched on. It is essential that you turn off your suit before reading the compass; turn the rheostat to the OFF position or pull the connector from the extension cord socket. Electrically heated flying suits do not affect remote reading compasses.

Gyro fluxgate compasses now incorporate a low-temperature starting button on the amplifier. When this button is depressed, additional power is supplied so that the gyro will start at extremely low temperatures.

The type A-10 sextant is the only type for low-temperature operation. When properly winterized, this instrument will give excellent results at low temperatures. However, there are two things that you must do in extremely cold weather:

Keep the flashlight batteries warm by carrying them inside your flying suit. Below -4°F, a dry cell will not generate sufficient current to cause a light to glow.

Avoid breathing directly on the surface of the index prism to prevent the formation of ice. If ice or frost forms on the prism, warm the surface with your hand until the ice melts; then very carefully clean the prism with a soft, clean cloth or cleaning tissue. This operation will not be necessary if you use caution and don't let your breath come in direct contact with the prism surface when the instrument is colder than the surrounding air.

A winterized type B-3 driftmeter will operate satisfactorily down to -65°F. Permit the gyro to warm up for thirty minutes after starting before uncaging it. If necessary, you can make drift measurements with the gyro caged. However, you will not have the advantages of gyro stabilization. It's impossible to turn the rheostats on these driftmeters at a temperature of -45°F or lower. So adjust the reticle light to the desired intensity before the airplane is exposed to low temperatures. A low-temperature starting button has been added to the B-3 driftmeter to provide additional power to the gyro for low temperatures.

Most precision watches are unreliable at temperatures below -40°F. Carry your master watch in an inside pocket and refer to it only to check your hack watch. You should have no difficulty with the hack watch as long as you wear it on your wrist. Do not wear the watch outside your clothing or leave it attached to the sextant for periods greater than fifteen minutes.

AIR FORCE LETTER)
NO. 205-25)

DEPARTMENT OF THE AIR FORCE
WASHINGTON, 30 MARCH 1949

SECURITY

Disclosure of Classified Information to Reserve Forces Personnel

(Effective until 30 September 1950 unless sooner rescinded or superseded.)

	Paragraph
Purpose	1
Scope	2
Policy	3
Investigation and Clearance	4
Residents of Foreign Countries and Foreign Nationals	5
Requirements	6

1. Purpose. To provide uniformity, this Letter outlines the policy of the Air Force with respect to the dissemination of classified military information to Reserve Forces personnel.

2. Scope. This Letter applies to the Air Force Reserve and the Air National Guard, and in addition, its provisions will be followed in connection with activities concerning the Air Reserve Officers' Training Corps and the Senior Division of the Civil Air Patrol. This Letter does not apply, however, to personnel on extended active duty.

3. Policy. In compliance with the provisions of AFR 205-1 regarding security of military information, Reserve Forces personnel may be entrusted with classified information as follows:

a. RESTRICTED information may be disseminated for official military purposes to any Reserve Forces personnel.

b. Except as authorized in c below, information classified no higher than CONFIDENTIAL may be disclosed to Reserve Forces personnel not on active duty who are actively participating in official training activities, provided that possession of the information is essential to the training course or program.

c. SECRET information may be disclosed to Reserve Forces personnel on active duty for training purposes and personnel not on active duty who have a mobilization assignment, provided that possession of the information is necessary in the performance of official assigned duties.

d. TOP SECRET material will not be used for training purposes in connection with Reserve Forces training programs. As authorized by paragraph 7, AFR 205-1, 14 March 1949, however, individuals serving on short periods of active duty whose assignments require it may be given access to the TOP SECRET information essential for the performance of their assigned duties.

e. Documents containing information classified higher than RESTRICTED will not be disseminated for retention by individuals. Such documents will be stored in military files only.

f. Reserve Forces personnel not on active duty who receive classified information will be informed that the information affects the National defense of the United States within the meaning of the Espionage Laws and that its revelation or transmission to an unauthorized person is prohibited.

g. Upon termination of active duty training, personnel will be briefed on the necessity for maintaining security of their professional knowledge while on inactive status.

4. Investigation and Clearance. Commanders concerned are responsible for requesting personnel security investigations and clearing personnel referred to in this Letter whenever required or necessary in accordance with separate Regulations.

5. Residents of Foreign Countries and Foreign Nationals. The provisions of AFL 182-4 and 8f, AFR 205-1, 14 March 1949, will be observed regarding dissemination of military information to persons residing in foreign countries, or to foreign nationals as defined in paragraph 2i, AFR 205-1.

6. Requirements. Although it is the desire of the Air Force to make available to Reserve Forces personnel such classified information as is required for training purposes within established training programs and courses, it is of primary concern that no breach of security will result from this policy. Commanders concerned will review continuously all classified material required by or of direct value to Reserve Forces activities, and whenever appropriate, will initiate down-grading action thereon in accordance with paragraph 27, AFR 205-1, 14 March 1949.

BY ORDER OF THE SECRETARY OF THE AIR FORCE:

* * * * *

*This Letter supersedes AFL 205-25 (formerly 46-7), 31 March 1948.
This Letter has been coordinated with and approved by the Chief, National Guard Bureau, as being applicable to the Air National Guard.

AIR INTELLIGENCE Review

This "Review" is published for three reasons:
1. To provide timely data regarding new techniques, practices and general information whereby intelligence personnel can maintain proficiency.
2. To provide material which will afford all personnel an appreciation of the intelligence role.
3. To provide a medium whereby all intelligence personnel and activities may exchange viewpoints, problems and solutions.

Two types of material are solicited for publication:
1. Stories and pictures relating to the intelligence activities being conducted within an organization.
2. Original articles of a noncontroversial but informative nature.

Material submitted must include sources utilized and the authors name, rank and present military affiliation. Mail stories to: The Editor, "Air Intelligence Review," ConAC, Mitchel Air Force Base, New York.

An Introduction to the

ECONOMICS

OF MOBILIZATION

In war, the belligerent with the greater industrial potential has an enormous advantage over its enemy. A nation whose economy in peacetime employs efficiently and on a large scale an abundance of human and material resources, is also strong in its industrial potential for war. But even the biggest human and material resources and the most advanced industrial technology do not, of themselves, guarantee victory. In some respects, specific preparations in the fields of resources and techniques must be made a part of a nation's peacetime security measures. For example, stock-piling of raw materials, development of substitute materials, and provision of certain facilities and equipment may be required.

Beyond all this,however,a nation's ability to shift its economic system quickly and efficiently to war conditions is of vital importance. The industrial requirements of war are so different from those of peace, and they are so urgent and large, that (except for nations constantly on a war footing) a special organization of the industrial system for war is necessary. That is, the potential of population, materials, and technology must be organized and operated for the particular purposes of war. The ability of a nation to solve this problem is a big part of its over-all war capabilities.

The purpose of this article is to present briefly certain of the basic organizational and control requirements of a war economy.

CENTRAL CONTROL

Few persons today, other than conscientious objectors, dispute the government's obligation to take charge of military manpower mobilization. Left to themselves, individuals would not volunteer their services quickly enough nor in sufficient numbers to meet the needs of the armed forces. Moreover, the uneven flow of volunteers from various walks of life would tend to disrupt industries whose continuous operation is essential to the war effort. Similar considerations point to the need for governmental mobilization of the industrial labor, materials, and machinery of the nation.

Put in simplest terms,the argument for national governmental control and coordination of industrial mobilization in wartime rather than dependence upon individual actions is this: The decision made by individuals for themselves, however reasonable they might appear from the individual standpoint,are likely to be insufficient, or too slow, or wrong, from the standpoint of the nation as a whole, when the nation is faced by the overwhelming problem of survival and victory in war.

THIS PAGE IS UNCLASSIFIED

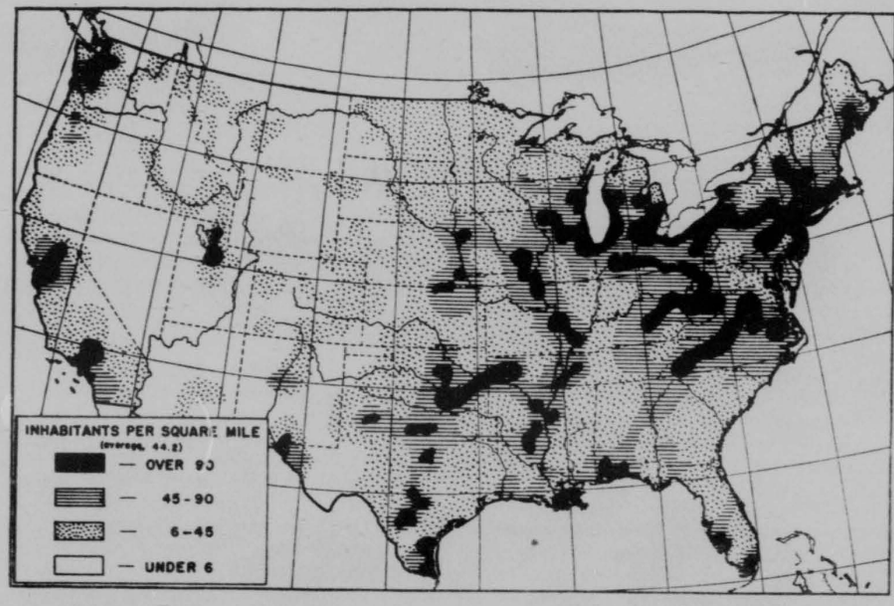
UNITED STATES
POPULATION DISTRIBUTION



MOBILIZATION TASKS

What, then, are the tasks of national government in economic mobilization for war?

The aim of a war economy is to insure the maximum utilization of the nation's resources of manpower, materials, and equipment in the effort to defeat the enemy. In order to make an adequate supply of manpower available to the armed forces, and, at the same time, to allot a sufficient number of workers to the production of war materials and essential civilian goods, it is necessary to utilize all available labor power. Labor must be directed into the necessary production fields through a system of priorities and drafts.

In order to curtail civilian production and expand war production, the flow of raw materials must be controlled so that essential production is adequately supplied. As an aid to financing the war and the smooth operation of the economic system, it is necessary to establish a system of price controls. The rationing of scarce civilian items is imperative in order to insure the maximum efficiency and morale of the population. In addition to stressing domestic war production, it is also necessary to undertake measures that will lower the war production of the enemy — that is, to engage in economic warfare.

RESTRICTED

1544

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

To sum up, the essential tasks in economic mobilization are:

1. To allocate properly labor, materials, and facilities.

2. To curtail civilian production and expand war production.

3. To control prices and ration scarce goods.

4. To undertake economic warfare.

INCREASING WAR PRODUCTION

When war comes, there is a tremendous increase in the demand for many civilian and military goods. Yet, in the face of this rising demand, a number of obstacles which may put a heavy brake on industrial output are likely to arise if left alone. One such obstacle appears when there is a heavy-handed general mobilization of manpower for the armed forces. That is, many skilled workers may be withdrawn from mines, factories, and railways at the very time that their skills are most urgently needed in the operation of war industry. Their places may be taken by older and younger workers, by women, and by recruits from non-essential industries. But these people will at first be less efficient than the former workers. At the same time, a speed-up of labor and higher prices of goods may lead to unrest, high labor turnover, and reduced produc-

tivity.

Steps have to be taken to counteract all this. For one thing, overmobilization of manpower for the armed forces must be avoided. On the basis of a detailed study of national manpower requirements, certain age groups and certain occupations must be made exempt from military conscription, at least for a time. Furthermore, activities of labor and management that hinder the expansion of essential production have to be restricted. It will probably be necessary to recruit unskilled workers, older men, women, and young people for work in war industries. These new workers must be trained. If they are brought to centers of industry, they must be housed. At the same time, labor must be withdrawn from the less important trades and industries. Obviously, if the pressure of war is heavy enough, conscriptive measures will be applied as much to industrial manpower as to military manpower.

It is also necessary that the production of non-essentials — like elaborate houses, pleasure automobiles, and jewelry — be curtailed ant that the output of munitions, machines that make munitions, and other essential supplies be greatly expanded. The prime means to this end is a system of priorities. Under a pricrities system, a specific ranking is attached to the various industrial orders, processes of production, and supplies of materials, in accordance with a scale of their importance to the war effort. Furthermore, under this system, materials, transportation facilities, and loans are allocated by the government to the various industries in accordance with the importance and urgency of their war production.

WAR FINANCE

The government needs a vastly increased amount of money, or purchasing power, during war. How can the government get this purchasing power? It can be obtained either by borrowing or taxing.

Outright, straightforward taxation is the most logical method. The taxpayer's purchasing power is definitely and quickly curtailed. This has the effect of reducing non-essential consumer demand for goods that should go into war production.

But taxation has its limitations. It is a slow way for the government to get money. In war, the government needs money in a hurry. This is the main reason — together with the largely incorrect notion of many people that war can be financed less painfully by means other than taxation — that governments in wartime resort in large measure to borrowing.

The big danger in large-scale borrowing, or loan financing, is not that the government has to pay interest on war bonds and eventually pay the principal back. The main trouble is that it makes for price inflation. Most of the purchasing power that the government gets by borrowing is provided by the banks, and it is an addition to the purchasing power already available to the country at large. Moreover, the government bonds held by the banks may be used by them as a basis for expanding their credits to individuals and business firms. Thus, there is a tendency for the total purchasing power in the nation to rise more rapidly than the amount of goods available for purchase.

The name we give to this situation is inflation. Prices of goods and wages of labor rise, some more, some

RESTRICTED

1546

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

less. The government, business firms, and individuals, compete for labor, raw materials, and finished goods. Some people stand to profit from the mounting prices. Others, whose incomes lag behind the rise of prices, make heavy sacrifices. These are the people who live on more or less fixed incomes -- receivers of rent, interest, salaries, and, to a smaller extent, wages. In other words, inflation results in a hidden kind of taxation, a taxation that is uneven and haphazard in the burdens it places on the people.

Much the same thing happens if the government goes in for the old-fashioned method of obtaining more money simply by grinding more dollar bills out of the printing presses. Currency inflation is an easy but an inequitable and dangerous method of war finance. It is dangerous because it leads to inefficient production and low morale. The conclusion is that, if the government in wartime supplements tax measures with loans, it must take steps to prevent inflation.

PRICE CONTROLS

Obviously, it is desirable to avoid the spiral of higher and higher prices. Rising prices of munitions will complicate the problems of war finance. Rising prices of essential consumer goods will lead to labor unrest and wage increases. Higher wages mean increased costs of production, and manufacturers will soon raise their prices further. The changes in prices will cause many economic and social troubles. These reasons make price control necessary. By the same token, wages must be regulated, in order to eliminate labor disputes and to hold down labor turnover in industries.

Under a system of price fixing, the quantities of goods demanded will be in excess of the quantities supplied at the fixed prices. That is, there will not be enough goods available to meet all demands. In order that the scarce goods may go to the people and industries that need them most in the interests of the war effort, action must be taken to withhold them from less important ones. This is achieved by means of priorities. In orther words, the systems of price control and of priorities supplement each other.

RATIONING

When the supply of consumer necessities - food, clothing, shelter -- falls below prewar levels, rationing of these necessities has to be introduced so that they will be distributed fairly. Otherwise, people with plenty of money, old friends of the grocer, and persons who have nothing better to do than shop will find means of getting more shoes and meat than people who have less money and time and more patriotism. Although rationing is necessary to the fair distribution of scarce goods in time of war, it leads to black market operations, by which purchasers obtain goods not available at ceiling prices or in excess of the quotas alloted to them. No government has succeeded in eliminating the black market entirely, and it is likely to persist until free trading is restored.

ECONOMIC WARFARE

In addition to these measures taken to maximise domestic war production, it is also necessary to undertake measures that will lower the war production of the enemy -- that is, to engage in economic warfare. Economic warfare is another aspect of military economics. Essentially, economic warfare attempts to reduce the enemy's war potential by destroy-

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

ing or capturing the materials and facilities necessary to his war effort and by blocking the movement of supplies to him from abroad. It requires a blending of military and economic measures. Air power has increased to a tremendous extent the range over which military measures of economic warfare may become effective. At the same time, an ever-wider sector of the economic system has been placed in the service of war, resulting in an increase in the objects of economic warfare and in a country's vulnerability to its effects.

ASPECTS OF ECONOMIC MOBILIZATION

It is important for military men to be aware of the importance of these measures of economic mobilization. The ability of a nation to use them effectively is one of the main elements in its ability to make war.

We should bear in mind that a totalitarian country such as the Union of Soviet Socialist Republics has a big start on us in economic preparation for war. Tick them off: Labor conscription; directing workers, materials, and funds to the industries that the government believes most important from a national standpoint; severe labor discipline; curtailment of the output of consumer's goods; and price control. Totalitarian nations have these things, not just in wartime, but all the time. Their people are accustomed to them, the government officials know how to operate them. Industrially, such a country can go to war overnight.

It is not surprising that nations whose economic system are relatively free in peacetime often find themselves ill-prepared when war begins. The British and French appeasement of Nazi Germany before 1939 came, at least in part, from a recognition that neither their armies nor their economies were ready for war. The United States entered the last war somewhat better prepared. The war in Europe had been in progress for some time, and Britain and France had placed with us large orders for munitions. American military production was further stimulated by the lend-lease program. But even with this advance preparation, the United States was on the strategic defense for many months after the Pearl Harbor attack. But for the oceans surrounding Britain, the Dominions, and the United States, it is unlikely that any democracy anywhere in the world would have survived the attack of the Axis powers.

We must remember this lesson. We have been saved in the past by the precious gift of time and space that enabled our people to beat their plowshares into swords <u>after</u> war had been thrust upon them. But modern weapons are destroying our old safeguards of time and space.

However, as World War II has shown, if democratic countries can withstand the initial shock of war, and if they are not utterly surprised by the enemy, they can develop both their military and their economic power as effectively as any autocratic regime.

Military Review Oct. 1949 Uncl

Modern war presents a problem of priority and sequence in mounting an offensive against the aggressor's forces and the sources of his strength. In the event of war, the United States has no choice but ...an attack of increasing violence, growing intensity, and widening global dimensions.

Secretary of Defense Louis Johnson

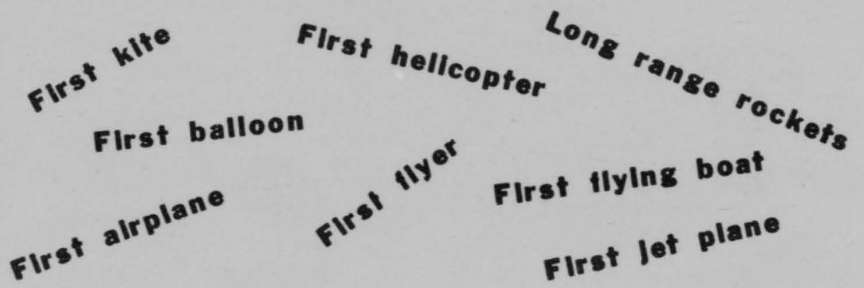
Anthology of

SOVIET INVENTIONS



AS A PART OF THE CAMPAIGN TO INCULCATE NATIONALISM IN THE SOVIET PEOPLE, THE SOVIET AUTHORITIES ARE ATTEMPTING TO PROVE THAT THE USSR OWES NOTHING TO THE OUTSIDE WORLD. AS ONE METHOD OF PROVING THAT ALL GOOD THINGS ARE OF RUSSIAN ORIGIN, EACH CONTRIBUTION MADE BY A RUSSIAN TO ANY SCIENTIFIC DEVELOPMENT IS HERALDED AS EVIDENCE OF SOVIET "FIRSTS" IN ALL FIELDS. AS A RESULT, THE USSR NOW CLAIMS CREDIT FOR ALMOST EVERY ADVANCE EVER MADE IN MODERN SCIENCE. RUSSIANS ARE NOW CREDITED WITH THE DISCOVERY OF EVERYTHING FROM ATOMIC ENERGY AND THE ANTARCTIC TO EVOLUTION AND PLASTICS. THE TOTAL EXTENT OF THE CLAIMS IS MEASURED BY THE FACT THAT THE USSR ACADEMY OF SCIENCE IS NOW ENGAGED IN COMPILING A COLLECTION OF SUCH SOVIET ACHIEVEMENTS, AND THE COLLECTION IS EXPECTED TO REACH TWENTY-TWO VOLUMES IN SIZE.

The zest with which Soviet Authorities have been claiming "firsts" in every field of material progress sometimes amazes outside observers. Russian scientists and inventors, it now appears, were the real discoverers of everything from the radio to atomic energy, and names familiar to generations of school shildren are now denounced as "imposters".

The Soviet obsession with priorities is part of the official Soviet campaign of nationalism which often develops into chauvinism. As a part of the drive, intensified after the end of World War II, to inculcate national pride in the Soviet people, the Kremlin authorities began publicizing alleged accomplishments of pre-revolutionary Russian figures, claiming for them the laurels which non-Russians had hitherto worn. Since most scientific discoveries are the result of the efforts of a number of people in various countries working over a period of time, it was comparatively simple to find a Russian scientist who had engaged in the preliminary experimentation and attribute to him complete and sole credit for the final results.

According to Communist propaganda,

RESTRICTED

1549

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

the fact that the "truth" of these discoveries could have been concealed so long is merely additional evidence of the reactionary character of the Tsarist regime. Not only did the Tsars fail to encourage science and protect Russian priority to these discoveries, according to the current Soviet line of reasoning, but they also failed to exploit the discoveries for the benefit of the Russian people. But while it is customary among Communists to denounce the old regime as the height of despotism, under which initiative and inspiration were crushed, the current scientific chauvinism tends to lead to the conclusion that Russian inventive genius reached its fullest flowering under the Tsars. For few of the discoveries now claimed as "Russian" date from the Soviet era. Even the Communist authorities have found few "firsts" to credit to the Soviet epoch.

The ludicrous nature of this rash of priorities becomes most apparent when these Russian claims are laid end to end: They reach from kites and the Antarctic to atomic energy and jet propulsion. At one time or another, waterpipes, icebreakers, Diesel locomotives, submarines, cobblestone streets, television, parachutes, and telephones were invented by Russians. And although the USSR is only now undergoing its industrial revolution, practically all the inventions which made the European Industrial Revolution possible a hundred years ago are currently labeled as Russian inventions.

Most people outside the USSR tend to laugh off the priority fetish as an amusing feature of the cold war, but in some states this manifestation of Soviet nationalism has run head on into nationalisms equally as strong. Tito's adherents, for example, challenge Soviet claims in several fields — particularly in radio techniques — and accuse the Russians of stealing credit for the work of Yugoslav scientists and inventors. But even these Yugoslav accusations have a tongue-in-the-cheek air about them. Apparently, only the USSR and its loyal satellites take the Soviet priorities seriously. Communist Parties in the loyal satellites continue their war on "all manifestations of chauvinism and nationalism" which "sometimes takes the form of open anti-Sovietism underrating the role and importance of the Soviet Union or even keeping silent about it." (Statement of Hungarian Communist Party, June 15,-1949.)

An exhaustive listing of everything claimed as a Soviet "first" is impossible — new claims are made almost daily. They appear in the most varied sources: In textbooks, technical journals, in the local press anywhere from Yakutsk to Erevan, on radio broadcasts, in geographies, aviation handbooks, in guides to Party workers, in speeches at the Academy of Sciences of the USSR, in every conceivable public channel of communication. Each holiday, anniversary or professional conference produces a new batch. And every research student and candidate for an academic degree who is worth his salt produces at least one new "first" in his chosen field of study. The resultant picture of accomplishments of the Russian people is spectacular in scope, to put it mildly.

Some specific fields and sciences appear to be more priority conscious than others. In aeronautics, electrical engineering, and chemistry, for example, everything worthy of note seems to be Russian-born. Present trends indicate, however, that given a little time other fields will catch up.

THIS PAGE IS UNCLASSIFIED

AERONAUTICS

The field of aeronautics as a whole seems, according to Soviet claims, to have grown out of the work of Russian scientists, for all progress there is directly attributed to their findings. On the theoretical side, the entire scope of the science of contemporary aerodynamics is portrayed as founded on the investigations of D.I. Mendeleev, N.E. Zhukhovski, and S.A. Chaplygin (Pravda, January 1, 1949). The first practical application of any aerodynamics theory was the glider invented early in the eighteenth century by a peasant, Ostrokov (TASS Agency dispatch, February 19, 1949). Alexander Mozhaisky, the father of modern aviation, built a kite in 1875 which was large enough to carry him aloft for a test flight (Pravda, February 20, 1949). He then progressed from kites to motor driven airplanes and patented his designs in 1875, twenty-five years before the Wright brothers. His plane was flown by one Golubev, who thus became the first flyer in the world (Moscow Bolshevik, January 16, 1949). In 1882 Mazhaisky also built and tested the first airplane propelled by a steam engine (Pravda, January 9, 1949; Komsomolskaya Pravda, January 9, 1949). (Strangely enough, however, the latest edition of the Short Soviet Encyclopedia has not been informed of the fact that Mazhaisky invented the airplane. The 1948 edition still gives the Wright brothers credit.)

Meanwhile, other inventors had not been idle. Kostovich produced a dirigible balloon with an internal combustion engine in 1889, and a Russian invented the helicopter (Radio Moscow, April 11, 1948). The design principles of a twin-propellered helicopter were worked out by Lomonosov in 1784, according to the USSR Academy of Science (Radio Moscow, April 11, 1949), and General Yurev patented a machine of this type which was exhibited at the International Airplane Fair in Moscow in 1912 (Ogonek, No. 16, 1949.)

The first superheavy four-engined plane in the world was built by the Russo-Baltic Works in St. Petersburg in 1913 (Radio Moscow, April 11, 1948), while Porokhovschikov built the first semi-biplane and double-tailed machine in 1912. A year earlier Porokhovschikov had set the speed record for aircraft (Radio Moscow, April 11, 1948). The first flying boat was the work of the Russian designer Grigorovich (Radio Moscow, April 11, 1948,) while naval aircraft was also the product of Russian inventive genius (Radio Moscow, July 5, 1948).

Most of the essential features of an airplane are of Russian origin. Zhukovsky apparently thought up the wings (Moscow News, December 27, 1947), while ailerons were the brain child of that prolific inventor, Moxhaisky (Radio Moscow, April 11, 1948). The draw propeller is another Russian "first", as is the stratostat and the pack parachute (Pravda, January 9, 1949).

Jet propulsion seems to be entirely Russian. Its principles were expounded by K.E. Tsiolkovski (Pravda, January 9, 1949), who also suggested the design for the first jet plane (Radio Moscow, April 11, 1948). Tsiolkovski's principles now constitute the basis of all calculations for the construction of jet planes (Radio Moscow, April 11, 1948). The jet engine itself was another Russian invention (Radio Moscow, July 16, 1948) and Soviet flyers were the first to master the art of high altitude group flights in jet-propelled planes (Komsomolskaya Pravda, April 8, 1949). "Today Soviet pilots

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

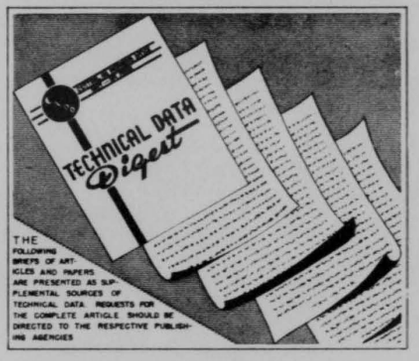
THIS PAGE IS UNCLASSIFIED

fly faster, farther, and higher than any other airmen in the world," according to Vassily Stalin.

Besides his work in jet propulsion Tsiolkovski also contributed much to the development of long range rockets (Radio Moscow, April 11, 1948), but, his work stemmed from earlier experiments with guided missiles made by K.I. Donstantinov (Radio Moscow, April 19, 1949).

But greatest of all Russian claims is credit for the loop-the-loop, first performed by the Russian Aviator, Nesterov. His achievement was immediately disparaged by Western flyers, but "all honest Russians sensed some sort of dirty trick in the hasty condemnation of Nesterov's loop by foreign aviators. Evidently preparations were being made abroad to misappropriate the discovery of the Russian genius" (Literaturnaya Gazeta, April 2, 1949). The loop-the-loop may one day stand as conclusive evidence of Russian scientific genius.

Uncl



T-29 MAKES FIRST FLIGHT

One of the Air Force's newest navigation trainers, the Consolidated-Vultee T-29, has made its first flight at San Diego. The T-29 is modeled after Convair's Model 240 transport.

As a flying classroom, the twin-engine low-wing, high-speed monoplane has 14 stations for student navigators. Each station is equipped with a laran scope, radio compass, altimeter, air-speed indicator, drift meter, and map table, Four instructors will accompany students on each flight permitting on-the-spot observation and training of cadet navigators during "live" navigation problems.

Like the Model 240, the T-29 is powered by two Pratt and Whitney R-2800 engines rated at 2400 hp each on take-off. Its performance is expected to approximate that of the civilian transport which has a top speed of more than 300 mph, a cruising speed of 250 mph, and a service ceiling of more than 27,000 ft.

The navigation trainer has a wingspan of about 92 ft, about 75 ft long, and approximately 27 ft tall. It is equipped with three-bladed, full-feathering, reversible-pitch propellers, and its landing gear consists of three sets of dual wheels.

THIS IS THE SIXTH OF A SERIES OF ARTICLES ON ARCTIC INDOCTRINATION

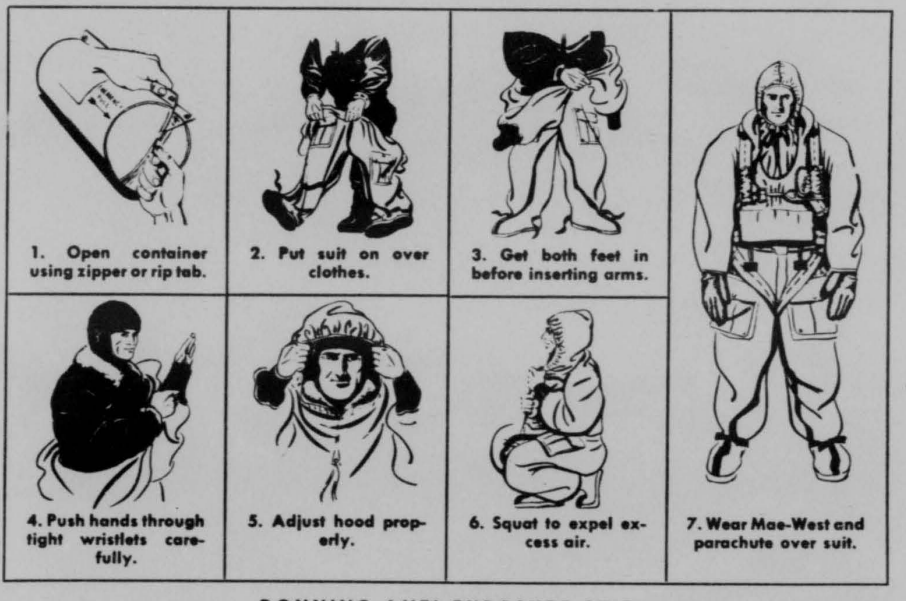
Chapter 17 - Water Survival

BAILING OUT

Bailing out is a very last resort. Don't bail out unless it is absolutely necessary. Should you have to bail out, however, remember that you can survive many hours immersed in polar waters if you wear a properly adjusted anti-exposure suit over adequate cold weather clothing.

The anti-exposure suit is one of your most valuable survival items. Aside from its value in bailing out over water, it is also good to wear while fording streams or digging out snow caves. Put it on over heavy flying clothes as shown in the accompanying illustrations. If time is short, you can put this suit over your life vest. Use care in forcing your hands throught the tight wrist bands. Leave some air in the suit for flotation. Keep the air up around your chest as much as possible. Be careful not to tear the suit on sharp objects in the plane. When in water, don't be alarmed by a slight leakage around your face and neck. The suit can take in a gallon or two of water without loss of flotation or insulating functions.

If there are no waterproof gloves in the pockets, wear regular gloves. You can wring them out after board-



DONNING ANTI-EXPOSURE SUIT

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

ing the raft, and they will help keep your hands warm and prevent them from getting stiff.

Don't hesitate to put on the anti-exposure suit over wet clothes if necessary. If possible, practice putting it on before making a flight. Without an anti-exposure suit, you may become relatively helpless in twenty to thirty minutes. The sensation of coldness is brief; numbness, stiffness, fatigue, and weakness develop in ten to twenty minutes and make swimming, climbing into life rafts, and other activities difficult. Within thirty to forty minutes a feeling of resignation and comparative comfort ensues, and loss of consciousness may follow. Immersion can probably cause death in thirty to ninety minutes by drowning through loss of consciousness, but with proper flotation gear, such as the B-5 Mae West, you may live longer even though unconscious. Don't be a fatalist and assume that you are good as dead as soon as you hit the water.

If you do bail out, don't inflate the Mae West until you unfasten the chest strap of the parachute. Get out of your parachute harness, avoiding shroud lines. Then inflate at least one half of the Mae West. If there is a brisk wind, you may become entangled in the chute; get upwind and to one side of it. Carry a knife in an outside pocket to cut away entangling shroud lines. Try to save your parachute, though, for it may be helpful later.

SWIMMING ASHORE

Try to swim ashore only if you are without a life raft. Keep your clothing on - it helps keep you warm. Wear your gloves to keep your hands from getting stiff. If you are wearing an anti-exposure suit or an inflated Mae West, swimming on your back is easiest. Swim leisurely. If you are caught in seaweed, pull yourself through by grasping vegetation. Ride breakers as much as possible unless they are very large, in which case it may be better to deflate your life vest and dive under. Avoid landing at places where waves break against rocks. If rescue by boat or plane is imminent, concentrate on keeping afloat. Don't thrash around in water. Such action only makes you colder. Keep the back of your head and neck out of water as much as possible.

Boarding Rafts

Boarding a One-man Raft.

After working free from your parachute and inflating your raft, get out of the water at once. Board a one-man raft from the narrow end. Pull yourself partly onto the raft, face down, kick your feet as in swimming, and then with a sudden upward and forward lunge pull the raft under you. Another method is to pull the raft under you before it is fully inflated. It then rises as inflation is completed.

If possible, board a multi-place raft from the wings or fuselage of your ditched plane, keeping as dry

RESTRICTED

1555

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

as possible. Don't jump into the raft. When several men are in water, one man should hold down one side of the raft while others climb in singly from opposite sides. Use a rope ladder if available. Without help, the best place to board a raft is over the end with the wind at your back. You can climb aboard more easily if your Mae West is not inflated.

To right a capsized raft, crawl up one side, grab the righting rope, life line, or right handle on other side, and fall backwards into the water pulling the raft on top of you.

Use the Gibson Girl.

IMMEDIATE ACTION AFTER BOARDING RAFT

If anti-exposure suits are available and you're not wearing one, put one on even over wet clothes.

If you have no anti-exposure suit, wring out your clothes and get as dry as possible. Keep the floor of the raft dry. Insulate the bottom of the raft, particularly beneath your buttocks and seat, with a parachute or any other available material. Wrap up in a parachute. Huddle together for warmth. Flex your muscles. If heat tabs and suitable containers, canned heat, or other means of heat are available, make a warm drink. It will be highly beneficial. First Aid is just about the same on a raft as on land.

Search for missing men. Also salvage floating equipment, especially emergency gear, matches, parachutes, clothing, and maps. Keep the raft inflated and plug all leaks. Tie all items securely to the raft to prevent loss if it capsizes. Put compass, watches, matches and lighters in a waterproof container. If there are two or more rafts, connect them with at least twenty-five feet of line.

If land is close by, head for it at once. Strong tides and currents make it difficult to handle rafts near the Aleutian Islands. Therefore, to prevent the raft from being swept away from the Chain into the Bering Sea or Pacific Ocean, make every effort to reach the nearest land immediately, regardless of the condition of the island.

If land is not accessible, stay clear of the plane but in its vicinity until it sinks. Use all possible signaling devices. In a raft, of course, the only way to use the Gibson Girl antenna is with the kite or balloon. Be sure, also, to use the radar corner reflector. It is particularly effective over water. Don't forget your visual signaling devices, either. On the other hand, don't waste flares, sea markers, or grenades - use them only when you sight an airplane or a vessel, and the chances of being seen are good.

PROTECTION FROM EXPOSURE

Your big problem on a raft is protection from exposure. Even if you

1556

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Protect Yourself from Exposure.

are wearing an anti-exposure suit, it is a good idea to put up the canopy unless the sea is calm and the weather mild. To erect the canopy on a multi-place raft, shift the oar-locks to six or eight inches from the handles of the oars. Insert this end of the oars through the reinforced holes in the canopy, and place the paddle end in the rubber boat on the floor of the raft. Snap shut the fasteners at the top, close the ends of the canopy by drawstrings, and tie them to the oars. When weather permits, an observer may sit at one end looking out, as illustrated. If the oars have been lost, the canopy can be drawn over the shoulders of the crew members. When the weather is good, you can roll the canopy down.

If the raft is not provided with a canopy, improvise one from a paulin, yellow side up. Tighten the life line around the raft and then tie the paulin firmly to the edges of the raft. For poles, use oars with one section of the handle removed. Use oar locks to help hold the poles in place. To prevent ripping of the paulin, use elastic cord from a parachute pack for ties at points of greatest stress.

SEAMANSHIP IN ROUGH SEA

In rough weather, put out a sea anchor on a line long enough to permit the anchor to be in the trough of a wave when the raft is on the crest. It may be necessary to improvise a larger or additional anchor from pilot chute, a Gibson Girl pack with holes cut in the bottom, parachute cloth, or other fabric. Improvise a shock absorber on the sea-anchor line to keep it from tearing off the raft. Use three or more elastic cords from the parachute pack as shown in the illustration, and make a loop of elastic cords. All men should remain seated. Distribute the weight to hold the weather side down. If temperature and wind permit, post a watch to guide the raft into waves and aid in weathering the swells. Each man should keep tied to the raft with approximately a ten-foot line so that the raft won't drift away if it capsizes. Have knives readily accessible to slit the cover if the raft turns over.

TRAVEL BY RAFT

The movement of a raft can be controlled partly by sail, sea anchor, tiller, oars, and paddles. Try to sail or drift toward land or into well-traveled air or sea lanes. To make best use of wind, rig a sail and inflate the raft fully. Be on watch for strong gusts and arrange the sail so it can be collapsed or turned edgewise into wind to prevent capsizing. To travel by currents, put out seat anchor and deflate the raft so it rides low, but not low enough to ship water. If rescue by an amphibious plane is in prospect, maneuver into the calmest water available, and drift down to plane or boat from windward side unless

1357

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

directed otherwise.

FOOD

Experience indicates that little drinking water is needed afloat on the cold northern waters. However, dew, rain, or snow can be caught on the paulin or other fabrics. Food will help maintain your strength and resistance to cold. Don't ration it too severely. Fish and birds are your only reliable native foods on a raft. Fish as much as possible. Keep bait or lures moving. Fish at different depths. Birds can be shot or sometimes caught on a baited hook dragged across water. Save fish and bird intestines for bait.

One of the best sources of food in polar waters is plankton - a conglomerate of minute sea animals, fishes, and plants which abound in polar waters. Whales and other Arctic animals, including birds, depend to a great extent on plankton for food, and laboratory tests have shown that it is high in nutritive value.

You can readily gather up plankton by dragging a conical net through the water. If you don't have a plankton net, you can improvise one from the upper part of a parachute canopy. Cut out the top to form a cone about three feet long. Tie the vent shut with the string and make a ring about 2 1/2 or 3 feet in diameter to hold the mouth open. Then tie a bridle to it and drag it through the water. Be patient. It will take quite a bit of dragging to secure a substantial amount of plankton. The best way to prepare plankton is to boil it and make a soup of it. But you can also eat it raw. The only disadvantage will be that, when raw, the tiny shells will stick in your teeth.

CARE OF PERSONNEL

Sea sickness may be relieved by lying down. Do not eat or drink while sick. Lack of bowel movements is normal on rafts - don't be disturbed by it. Likewise the dark color of urine and difficulty in passing it are normal - don't get worried. To prevent immersion foot, keep your feet as dry and warm as possible. Massage and exercise. Elevate your feet and legs for half-hour periods several times a day.

GETTING ASHORE

Dangerous tides, rips, whirls, and boils occur in narrow passes between islands; avoid them if possible. Surf is heavy on exposed shores; calmer water lies at heads of bays and coves, and in lee of islands and projecting points.

Going ashore in heavy surf is dangerous. Take your time, plan your approach. Lash down all equipment. Open the canopy cover but keep it draped over your shoulders. Keep anti-exposure suits and clothes on. Adjust and inflate your Mae Wests. Trail the sea anchor over stern on a long line. At least one man should face seaward to warn of approaching waves. Don't let the raft get broadside to waves; control it with the rudder oar. Watch for offshore rocks. If the raft capsizes in the surf, try to fall out on the seaward side and grab hold so it can pull you toward shore.

Upon reaching shore, don't assume that your troubles are over. A big task still lies before you - the task of surviving on land - unless, of course, you have landed near a village or inhabited area.

AIR FORCE LETTER)
NO. 205-25)

DEPARTMENT OF THE AIR FORCE
WASHINGTON, 30 MARCH 1949

SECURITY

Disclosure of Classified Information to Reserve Forces Personnel

(Effective until 30 September 1950 unless sooner rescinded or superseded.)

	Paragraph
Purpose	1
Scope	2
Policy	3
Investigation and Clearance	4
Residents of Foreign Countries and Foreign Nationals	5
Requirements	6

1. Purpose. To provide uniformity, this Letter outlines the policy of the Air Force with respect to the dissemination of classified military information to Reserve Forces personnel.

2. Scope. This Letter applies to the Air Force Reserve and the Air National Guard, and in addition, its provisions will be followed in connection with activities concerning the Air Reserve Officers' Training Corps and the Senior Division of the Civil Air Patrol. This Letter does not apply, however, to personnel on extended active duty.

3. Policy. In compliance with the provisions of AFR 205-1 regarding security of military information, Reserve Forces personnel may be entrusted with classified information as follows:

a. RESTRICTED information may be disseminated for official military purposes to any Reserve Forces personnel.

b. Except as authorized in c below, information classified no higher than CONFIDENTIAL may be disclosed to Reserve Forces personnel not on active duty who are actively participating in official training activities, provided that possession of the information is essential to the training course or program.

c. SECRET information may be disclosed to Reserve Forces personnel on active duty for training purposes and personnel not on active duty who have a mobilization assignment, provided that possession of the information is necessary in the performance of official assigned duties.

d. TOP SECRET material will not be used for training purposes in connection with Reserve Forces training programs. As authorized by paragraph 7, AFR 205-1, 14 March 1949, however, individuals serving on short periods of active duty whose assignments require it may be given access to the TOP SECRET information essential for the performance of their assigned duties.

e. Documents containing information classified higher than RESTRICTED will not be disseminated for retention by individuals. Such documents will be stored in military files only.

f. Reserve Forces personnel not on active duty who receive classified information will be informed that the information affects the National defense of the United States within the meaning of the Espionage Laws and that its revelation or transmission to an unauthorized person is prohibited.

g. Upon termination of active duty training, personnel will be briefed on the necessity for maintaining security of their professional knowledge while on inactive status.

4. Investigation and Clearance. Commanders concerned are responsible for requesting personnel security investigations and clearing personnel referred to in this Letter whenever required or necessary in accordance with separate Regulations.

5. Residents of Foreign Countries and Foreign Nationals. The provisions of AFL 182-4 and 8f, AFR 205-1, 14 March 1949, will be observed regarding dissemination of military information to persons residing in foreign countries, or to foreign nationals as defined in paragraph 2i, AFR 205-1.

6. Requirements. Although it is the desire of the Air Force to make available to Reserve Forces personnel such classified information as is required for training purposes within established training programs and courses, it is of primary concern that no breach of security will result from this policy. Commanders concerned will review continuously all classified material required by or of direct value to Reserve Forces activities, and whenever appropriate, will initiate down-grading action thereon in accordance with paragraph 27, AFR 205-1, 14 March 1949.

BY ORDER OF THE SECRETARY OF THE AIR FORCE:

- - - - - -

*This Letter supersedes AFL 205-25 (formerly 46-7), 31 March 1948.
This Letter has been coordinated with and approved by the Chief, National Guard Bureau, as being applicable to the Air National Guard.

GRIM DETERMINATION

SUDDEN DECELERATION

SUDDEN ACCELERATION

ALL OVER

The Human Decelerator

Air Force Volunteers, riding in rocket propelled sleds, are now duplicating airplane crashes in an effort to provide greater flying safety. The tests have provided aeromedical science with heretofore unobtainable data for reducing injuries in aircraft crashes.

The "Human Decelerator" is propelled by four rockets and attains speeds of 175 to 240 mph before it slams into the braking area where it is decelerated with a force up to approximately 35 G's (35 times the force of gravity).

The rocket-powered 1500-pound sled roars down a 2000-foot track to a 45-foot mechanical braking system which is located a little more than halfway down the track. The G force in each test is governed by the number of rockets fired and braking force applied to sled.

In earlier tests, the entire sled was covered with an aluminum canopy. This was later removed and current tests are being conducted with only an aluminum wind screen in front of the subject.

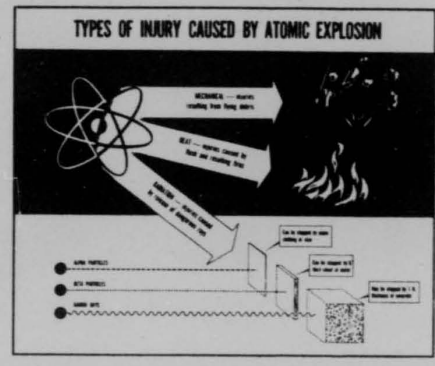
PERSONAL DEFENSE AGAINST ATOMIC EXPLOSIONS

You can do a great deal to protect yourself against the effects of an atomic bomb explosion. The most important item in your personal defense plan is, of course, taking shelter. Get to an air raid shelter, a deep basement, or a subway. Where there is no such shelter, get into any depression in the ground - a ravine, a ditch or a fox hole - and cover yourself with a tarpaulin or similar cover. In any event, keep away from frame buildings and other light structures. Not only are they likely to collapse on you, but they may also catch fire and burn you.



Where you can't find any shelter at all, throw yourself flat on the ground. This will help protect you against the blast. To prevent flash burns, try to cover yourself completely with some light colored cover. For this purpose, it is good also to wear loose-fitting, light-colored clothes during periods when an atomic bomb may be dropped. The various Air Force uniforms are all satisfactory in this respect.

After the bomb has exploded, you must still be careful because of radiological dangers unless the bomb has exploded high in the air. With this type of explosion, there is little danger of contamination, for all the radioactive products are sucked up into the mushroom cloud. In such cases, get out of your shelter and make yourself useful by helping put out fires, removing survivors, and doing other rescue work.

When the bomb has exploded under water or very close to the ground, however, stay in your shelter until radiological defense personnel indicate that it is safe to get out. Generally speaking, the radiological danger will be far less inside your shelter than out. When no radiological clearance is available, therefore, stay in your shelter a while to allow the radioactive intensity outside to decrease. If you leave your shelter and find that you are in an area of marked contamination, get out of the area fast. Remember that radioactive intensity is seldom so high that you get a lethal dose instantly. It generally takes a while even in areas of extremely high contamination. So don't give up and think you're a "dead duck" because you've spent a little time in a highly contaminated area. Get out fast and go to the nearest medical center for a check.

On the other hand, don't assume that the precautions set up in contaminated areas are just a "lot of red tape". If you don't stick to the time limits set up by the radiological defense officers, or if you

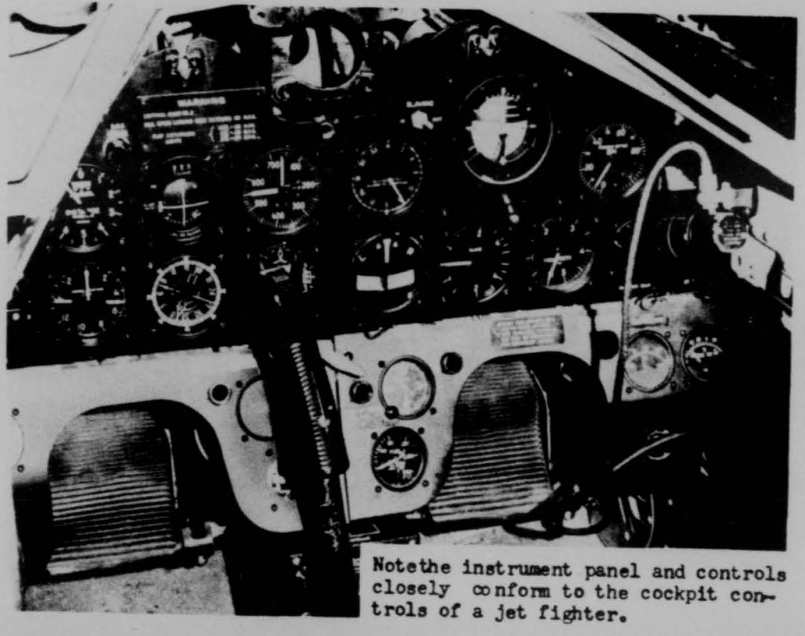
The new Link trainer resembling closely simulated jet flight is complete to a minute degree.



Notethe instrument panel and controls closely conform to the cockpit controls of a jet fighter.

NEW JET INSTRUMENT TRAINER

This new jet instrument trainer, accepted by the Air Force after extensive tests by Air Materiel Command Hdqs., Dayton, Ohio, will provide realistic ground training for Air Force pilots. It is essentially a combination of three trainers; flight, engine operation, and radio navigation, and has an instructor's position behind the cockpit.

Manufactured by Link Aviation, the trainer does not move on its fixed base but includes all of the controls, instruments and indications of a high speed jet aircraft with rates of roll, climb, and acceleration duplicated. A series of emergency controls are employed with which the instructor can produce a variety of conditions which might be encountered in actual flight. A system of 23 colored lights is employed to inform the instructor of any errors made by the student in the cockpit. The jet trainer also has equipment which makes it possible to give instruction in the latest type radio procedures and navigation techniques.

The Jet Link Trainer is of all metal construction with a number of doors for easy access in maintenance. It is 14 feet long and weighs 3750 pounds.

Outline of a

WAR PLAN AGAINST RUSSIA

This unusual thought provoking article, written by a Russian-born DP is being presented for your perusal despite the fact that it carries a C-6 evaluation. During the war the author served as an interpretor for the Germans and moved with the first armies into Soviet territory. He claims that it was during the first invasion of the Ukraine that the Germans made their greatest mistake by mistreating the pro-German Ukrainians. It is evident that he bases his outline of a War Plan Against the USSR, upon this theme.

1. GENERAL OUTLINE OF A WARFARE PLAN AGAINST THE USSR

It must be clearly realized that a war against Soviet Russia would mean a total war, fought primarily along Political and Psychological lines, and that the political fighting would not be restricted to the territory of Soviet Russia, but would involve the whole of Europe, North and South America, as well as Asia and the Middle East. The purely military war will necessarily be of secondary importance.

The strategic aim of a political war should be: The annihilation of the Communist Party leadership and all its branches.

The strategic aim of the purely military war should be: The complete destruction of the military forces of the Communists, be they Russian, Polish, Czech, Hungarian, Yugoslav, Chinese, or any other.

Above argumentation implies that the actual enemy would be the Communist Party and not the Russian Nation. This differentiation is the basic aspect of a war against Soviet Russia, as well as against any other nation at present dominated by Communist minorities.

It cannot be stressed often or strongly enough that Soviet Russia won the war against Germany primarily because of the incapability of the Germans to differentiate between the Russian Nation and its Communist leadership.

The slightest error in the political warfare against Soviet Russia would once again arouse the inestimably strong resistance potential of the Russian Nation against any "liberators" alias "invaders", of whatever creed or nationality they may be.

To win this strong resistance and combat potential for the anti-Communist cause, should be the main object of the aggressive political warfare against Soviet Russia. In other words, all efforts should be exerted to cause the Russian Nation itself to turn against their Communist leaders.

It is obvious that once the vital centers of the Communist Party have been destroyed, Communist Party branches that might be sufficiently strong to

 RESTRICTED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

offer resistance, would not represent as great a danger without their central leadership and could be dealt with singly.

2. ANALYSIS OF THE STRONG AND WEAK POINTS OF SOVIET RUSSIA

a. Strong Points

(1) Geographically - The vast expanse of Soviet Russia, covering almost two continents, defies all orthodox conceptions of military strategy based on frontal attacks and gradual advances on enemy territory. History does not show one example where the Soviet Union has been conquered by a foreign invader. Therefore, it is reasonable to argue that in the future no invader would be able to summon forces strong enough to conquer the entire expanse and hold it against a hostile population.

During the last war at certain periods of the campaign against the USSR, the Germans did not meet any resistance along front sections hundreds of miles long. They could have marched on indefinitely, but did not do so because they would have dispersed themselves into a vacuum, which would have stretched out supply lines, and imperiled the safety of their hinterland.

The communications lines of any invading army would stretch out along thousands of miles of very bad roads which very quickly would wear out the most efficient vehicles. Also, it must be considered that every single mile of the supply lines would be exposed to attacks of "partisans", and the like. Bridges, too weak for heavy vehicles or tanks as it is, would be in constant danger of being blown up.

Railway lines, running mostly in a north-south direction, are a broader gauge than American or European standards. Most railroads, like major roads, converge toward Moscow.

Most airfields are levelled fields with rarely any finished runways.

The climate is trying for any person not used to it. Central and Southern Russia, as well as Siberia - in its inhabited zones - are exceedingly hot in summer, and exceedingly cold in winter. Spring and autumn mud make roads practically unpassable for as long as four to six weeks, until they either dry or freeze. From spring through autumn, airfields are too soft to permit even a light fighter plane to take off or land. Therefore, spring and autumn cannot be considered for any military action which would involve major movements of ground forces or the operation of airforce units stationed on Russian airfields. At the same time, invading units would be severely handicapped in winter by severe frosts and high snow, and by the lack of water in summer. Nature itself then has created defense conditions that are unsurpassable by man.

(2) Politically - The strength of the Red Army lies foremost in its rigorous political discipline and the meticulous surveillance of the political attitude of each soldier and officer. Throughout the whole term of service the single soldier as well as officer is closely watched. Any suspicious

 RESTRICTED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

action or statement is inscribed into secret personal records, and may be held against him years afterwards.

The surveillance of the personnel is threefold: One - by the CP, represented by the political commissar of the respective unit; two - by the MVD, represented by a secret agent in every company; three - by the military counter-intelligence, represented by one of the officers of the unit. Everyone of the three named persons has his secret denouncers of "seksoty". A company consisting of 90 men would have about 30 "seksoty". Regular reports are made on every member of the unit, knowing very well, that equal reports are made on themselves by others. Secret denouncers remain secret, with the result that everybody is afraid of everyone else, and that conspiracy is practically impossible.

Soldiers drafted from one town rarely if ever serve in the same unit. They are dispersed throughout different units with the purpose of not letting "friends" get together to agree on some subversive activity.

The same system of surveillance is applied with equal success to the civilian population. They are watched as well in their homes as in their jobs, factories, offices, or whatever their places of work may be. Obviously, such surveillance would necessarily restrict conspiracy to very small numbers and also make for easy disposal.

In the past 30 years, insurrections throughout the USSR have been easily localized and quenched, without the fact being known either inside or outside the USSR. Any information, therefore, tending to create the impression that at present there exist wide or influential anti-Communist movements in Soviet Russia, should be considered very carefully in view of the above aspects of the actual situation. It should also be considered whether this information could have possibly been intentionally "planted" so as to effect an underestimation of the Communist political potential, or again to provoke inconsiderate actions.

The CP clearly realized the fatal political error of the Germans in 1941 by not differentiating between the Russian Nation and the CP. The Communist Partyimmediately began to exploit this fatal German error with great effect. The Germans in the first stage of the war were greeted with flowers, but by 1942 the entire hinterland of the Germans was dense with partisans. It must be remembered that these partisans were mainly non-Communist, who followed the Communist leadership in opposing the oppressors of the Russian Nation.

The success of the Communist Party was due to the fact that it had made itself the champion of Russian Nationalism (although a year before Russian Nationalism in any form was considered a political crime), meeting and inciting thereby the subconscious desires of the majority of the Russian Nation, and giving a positive name to the negative resentment of the Russians towards the Germans. Although many may have understood the purposeful lies of the CP, still it must be realized that this sort of nationalistic propaganda has set deep roots in the ignorant population, who will be strongly suspicious against "anything foreign".

RESTRICTED

1568

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

In summation, it may be said that the political strength of the Soviet Union lies in the fear of the individual citizen, and in his ignorance. Unless the fear and ignorance are removed, the war could not be won.

(3) Military - The purely military strength of the Red Army lies in its adequate equipment, the endurance, and the unpretentious, almost spartanic ways of life of its members.

Soldiers are known to have been fighting fiercely without having had adequate food for weeks. In combat conditions, regular meals are the exception, and soldiers are happy to receive even one primitive meal a day. This fact simplifies the problem of supply and permits the Red soldier to live off the land, while any opposing army would depend on regular supplies.

The weapons of the Red Army as used during the last war, and perfected since, are foolproof against climatic changes or other specific combat conditions on Russian territory. The comparative primitivity of Red Army weapons gives them the advantage of efficiency even in exceptional conditions. Also, it permits easy repairs in the units under combat conditions. The German Army learned this harsh lesson too late. Their highly mechanized weapons, i.e., tanks, trucks, automobiles, super-speed machine guns etc., normally uncomparably superior to any Russian weapons of the same kind, became valueless in extreme heat or extreme cold, or through exposure to sand or dust storms. The multiple kinds of spare parts for every particular make necessitated the supply of great quantities of spare parts, and the maintenance of great repair shops and repair units.

The Russian Air Force, though not much noted during the last war, undoubtedly had the elite of personnel. The air force was excellently fed, paid, and supplied. Cases of desertion from the air force were negligible during the war, although fliers would have had better chances for desertion than members of the ground forces. If the same fighting spirit is prevalent in the air force of the Soviet Union today, it will be a formidable opponent.

(4) Economically - The Soviet Union is self-sufficient to a very high degree and cannot be fought by an economic blockade. Food is stored and industries are dispersed over the entire expanse of the Soviet Union. The loss of any one province or even a group of provinces would not considerably affect the situation.

b. Weak Points

(1) Geographically - The vast expanse of the territory becomes a weakness in case Russia should be attacked suddenly in several places at once, and would have to depend on its inadequate means of communications in order to rush reinforcements to target areas. The whole communications system is highly vulnerable to aerial attacks.

(2) Politically - The constant fear which holds the average Soviet citizen, either military or civilian, in a sort of hypnotic spell, once removed, would release primitive forces. It is reasonable to presume that this primitive force would turn against the Communist Party who have oppressed the

RESTRICTED

1569

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

population far beyond understanding of civilized man. The CP is well aware that its strength lies in the subjugation of the entire population, and it is also aware that its power would end the very moment it lost control over the population.

The weapons of subjugation, propaganda and persecution, could be wrung from the hands of the Communist Party through a physical destruction of the centers of propaganda and persecution, and the setting up of a propaganda machine that would be stronger than that of the Communists.

Propaganda, during the war and post-war, has been conducted along two lines, i.e., Russian Nationalism and pride of achievements (military, industrial, cultural). Should the Russian Nation, now, in case of a new war, become convinced that the Communists are not the champions of nationalism as they claimed to be, and should the Russian Nation realize that there is another force - essentially national and at the same time anti-Communist - it is logical and natural to take it for granted that the majority would turn against the CP and destroy the last traces of it with a thoroughness that no other power nor weapon could accomplish.

(3) Military - The fighting morale of the average soldier, upheld at present by Party Propaganda and persecution, would collapse the very moment the central propaganda machine is smashed. He would not fight his own civilian population or other Russian soldiers who opposed him in the name of a Free Russian Nation.

(4) Economically - The weak point of the Soviet economy is oil. The producing points are too far from the industrial centers, and transportation is a great problem. Oil refineries are scarce and did not function properly during the war. In fact, quite frequently Russian airplanes and motorized units were inactive for considerable periods of time because of the lack of fuel. It is questionable whether at this date the antiquated and partially war damaged oil refineries have been able to produce adequate supplies, and it is still more doubtful whether the oil and gas reserves have been equitably distributed throughout the industrial areas and the air force bases. Further, presuming that this is so, then the numerical increase of airplanes and motorized vehicles since the war period does not actually give the strength of the air force or the army with regard to their present readiness for combat. Therefore, it is reasonable to conclude that the disruption of oil supply from the Caucasus would decrease considerably the war potential of the air force as well as of the entire army.

c. Conclusions - The ultimate aims of warfare against Soviet Russia will be: The total destruction of the Communist Party leadership and its branches. The total defeat of the Red Army. The total liberation of the entire Russian territory from the Communist Party, Red Army and MVD.

The above analysis of the strong and weak points of the Soviet Union compels one to draw the following conclusions:

(1) The war must be commenced by the USA.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Reason: The initial surprise attack must attempt to paralyze at once the leadership of the Red Army, cut off the supply lines, destroy supply centers, disorganize central leadership. At the same time, the initial blow must be directed against the Communist Party propaganda centers, and against security centers like MVD Headquarters.

Tactical Aim: The Red Army, the Communist Party, the MVD, must be put on the defensive, and not have the time for an offensive.

(2) The war should be conducted on Russian territory.

Reasons: The Red Army, at present far inside Europe, should be cut off from its supply lines, and should be deprived of its central leadership. The destruction and even partial occupation of Red Army's homeland and hinterland would render the Red Army units inside Europe helpless, even more so if they tried to advance.

Tactical Aim: Red Army units inside Europe should be paralyzed.

(3) No frontal attack against the Red Army or the territory of USSR should be made.

Reason: Geographical, political

(4) The Attack must be directed against the Russian hinterland and must be carried out at several places at once.

Reason: An attack should be made at several places at once with forces strong enough to defeat militarily, making it impossible for the Soviet General Staff to rush reinforcements to all attacked places at once.

Tactical Aim: Destruction and/or occupation of key areas.

(5) The war against the Soviet Union must be converted from a military war against the Red Army into a political war against the Communist Party.

Reason: The weak points of Soviet political structure. The moral collapse of the Communist Party would necessitate the collapse of the Red Army.

Tactical Aim: To recruit the help of the Russian Nation against their oppressors.

(6) The war against the Communist Party must be fought primarily by the Russian Nation.

Reason: No foreign nation could occupy the whole expanse of the Russian territory. No foreign occupation troops would be capable of making a distinction between Communist and non-Communist Russians. No foreign troops would be able to endure the climate, nor live off the land. No foreigners would be acceptable to the Russians as administrators of the occupied areas:

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

(7) The war in its further development must be conducted on the lines of 100% aid to a Russian Liberation War.

Reason: As above; besides - US Forces at this period of the war could be much more effectively employed in surrounding and defeating Red Army Units in the comparatively limited areas of Soviet occupied Europe. There, US Forces would not meet the hostility of the native population, although, even there, national units should be employed as much as possible.

3. ACTUAL WARFARE

Above conclusions logically compel the conception of a warfare as primarily political and secondarily as military.

a. Military - The military warfare, with ultimate goals as stated above, should be considered in two stages of development.

(1) First stage of Development

The war should begin with a surprise bombardment with the most destructive bombs against the vital centers for their complete destruction or disorganization. Main areas should be: MOSCOW, LENINGRAD, ODESSA. Main target areas should be: The KREMLIN,the MINISTRIES, COMMUNIST PARTY HQ, ARMY HQ, MVD HQ, RADIO STATIONS, RAILWAY STATIONS, BRIDGES. An attempt should be made to destory physically the entire leadership of the Party, or at least to deprive it of means of communications with their organizations.

Simultaneously, detachments of paratroops and airborne troops should be landed in key areas. Suggested areas in European territory would be: Northern CAUCASUS; territory NE of the DONBASS; territory between MOSCOW and VOLGA; MINSK; CHARKOV; KIEV; area NE ODESSA; ESTONIA; LITHUANIA; Eastern POLAND. These detachments should consist primarily of natives of the target area. However, all soldiers of the detachments should be clothed in Russian uniforms with a distinctive marking, i.e., an armband of Russian national colors (white, blue, red) or something similar. The detachments should be about 3,000 to 5,000 men strong and armed with highly mechanized small arms, hand grenades, bazookas, but should initially have no artillery, tanks, nor any other vehicles.

The tactical aim of each detachment should be: To occupy Party Hq, military barracks, airfields, radio stations, railway stations, power plants, arms and equipment stores.

The ultimate goal of each detachment should be: To occupy a key area, annihilate any military and political opposition tending to enlarge the occupied area with the aid of volunteers and/or deserters. The enlargement of the area should not take place beyond such limits set by the strength of the initial detachment plus the number of volunteers, to avoid weakening the hold on the key position through dispersal. Able and trained native propagandists and administrators should accompany each detachment, so as to effectively recruit the natives for the insurrection against Communism. This recruiting task should take place with a minimum of delay.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Persons, specialized in setting up an effective local administration, should be brought in immediately after the area is under complete military control, and a local police force should be set up to preserve order and the continuation of supply of food, power, water, etc. Ultimately, the key areas should expand to such an extent as to unite and form large occupied areas.

Should certain areas show strong resistance, it would be possible to surround these areas and to launch secondary airborne detachments in the hinterland of the opposing forces. In no case should a linked land front against resistance be formed, as any such frontal attacks would extend the duration of war and hazard the eventual outcome.

Presuming that the strength of each paratroop or airborne detachment would not exceed 5,000 men, and that there would be a total of about 15 launching key areas, the total strength of the initial invasion forces would be 75,000 men.

Their supply should consist of ammunition only, in the first stage, that is, as long as the detachment had not yet completed control of the key area. This supply should be equally airborne. It is logical to presume that the supply requirements would decrease in the same degree as the detachment could possess itself of the local supply stores. Later supply would consist mainly of gas for the vehicles, and heavier arms wherever necessary.

This first stage of development of warfare would be a success solely on the presumption that great importance is attached to parallel political actions which would permit or insure the help of the population and/or insurgent Red Army units.

b. Second stage of Development

While the success of the First Stage of the warfare will largely depend on the ability to use psychology as a weapon, it will be still more important during the Second Stage.

The war against the CP will not end until the entire Russian territory is liberated from the control of the Party. It can be presumed with certainty that CP leaders would retreat to some emergency centers prepared in advance, if they had not been physically destroyed in the early stages of the war, and from these centers conduct a "fight for survival".

Any strategy of the CP will have to be countered by psychological weapons. The population of the liberated areas should be psychologically prepared in such a way that a "recruitment" of the population for the Communist cause would be an impossibility.

Once the CP has lost all key areas, all industrial centers, all radios, and the major part of its air force, during the first stage of the war, and measures have been taken to ensure that the population of the liberated areas would not be susceptible to Communist underground propaganda, it is of no importance whether the final stage of the war would last even a year or more. It

 RESTRICTED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

is presumed that the last stage of the war would take place mainly in areas difficult to approach, i.e., Siberia, Central and South-Central Asia, Mongolian Desert, etc. The geographical nature of these territories makes it necessary that this last stage of the war be conducted by Russian soldiers exclusively, on the lines of a "National Liberation War," or rather a "civil war".

4. ORGANIZATION PROBLEMS

Main difficulties in the practical formation of a Russian paratroop assault force of 75,000 - 100,000 men would be the fact that such information would become known prematurely to the Communist Party, Soviet Military Intelligence or the MVD.

a. The following suggestions are made to overcome this difficulty:

(1) Russian DP's of draft age should be encouraged to emigrate to Canada. On arrival, they would be drafted into Canadian units, and later transferred to special training camps.

(2) Russian DP's should be "recruited" under attractive conditions into the French Foreign Legion. On arrival the procedure would be similar to that of the Canadian units.

(3) Specially selected Russian DP's, possibly with officer's qualifications, should be taken clandestinely to the US bases in Iceland and Greenland, where they would undergo officer's training under the supervision of US and/or British Commando officers.

The bulk of the soldiers of the Russian assault units would be drawn from the Russians presently in Germany and Austria, numbering about 150,000.

Take off bases for the assault units would be appropriately situated in Northern Africa, Iceland, Alaska, Iran. These same locations would be suggested for airlift supply stores during the initial stage of the war.

It may be stated conclusively that the practicability of the plan is believed to be well within the scope of the present US military capability.

b. Political Warfare - The success of the military war will largely depend on the success of the political war. It is logical therefore, that the intricacies of the political war should be studied and preparations made with at least as much care as the purely military necessities.

c. General

Ever since its foundation, the CP has been at war with the non-Communist world. This war, called "Klassenkampf" (war of the classes) by Karl Marx, is one of the fundamental doctrines of the CP. By its nature, it has always been aggressive against the "reactionaries," and is not supposed to end before the ultimate goal - World Revolution - has been won. The pretext for the continued existence of the CP and for the ultimate goal - is the "social injustice" in non-Communist countries.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Ideologically, anti-Communist powers would have to adopt an idea stronger than Communism. The idea, which could conquer Communism, would have to be positive and fundamentally antagonistic to Communism.

While revived Christianity would be the primary weapon for conquering Communism, it is not believed that this ideal is strong enough in non-Communist countries to attract essentially Christian crusaders, and it is doubtful whether a modern atomic war could be carried out in the name of Christ.

The idea which would rate second strongest, would appeal to Russians, inside as well as outside the "iron curtain", and would appeal even more to the various Eastern European Nations, which at present are dominated by the Communists, is - Nationalism.

Nationalism, as opposed to Internationalism, has been strong enough to win over Communism in Italy, Spain, and Germany. Although Germany developed a form of Nationalism which was as materialistic as Communism, this may not be necessary in the case of Russia nor in any of the other Communist dominated countries, providing the Catholic Church and other Christian Churches would do their share in eliminating materialism. It is believed that the majority of non-Communist leaders, at present in exile, are not materialists, having been purged through suffering.

With regard to the attitude of the Russian Nation, it can be said from intimate knowledge of its psychological structure, that the average Russian is highly susceptible to idealism and particularly inclined to enthusiasm that might involve self-denial and even sacrifice for a higher ideal. In fact, it was this susceptibility to idealism that so largely helped the CP to enlist support of the Russian Nation for the ideal of a Revolution in 1918. Again, in 1941-1945, it was this capacity for idealism which was exploited by the Communist Party when the latter appealed to the Russian Nation to oppose the "invaders" in the name of Russian Nationalism and even in the name of Religion.

The fact that the CP has been ingenious enough to exploit the idealistic inclination of the Russian Nation for its own ends, still does not make the Russian a materialist. In fact, history will classify the present situation, where idealistic Russians are defending materialistic Communism as a paradoxical phenomenon. History has proved that the Russians are by far less materialistic than any of the other nations of the white race. Therefore, the aim of the strategic warfare against the CP will be - to win the idealism of the Russian Nation, through Nationalism, for the anti-Communist cause.

d. Organization of Political Warfare Against Soviet Russia

The political warfare against the CP would be a "World War" which would involve the Communist Parties of all nations, including the USA, but it should be aimed primarily at the central base of Communism, i.e. Soviet Russia. The justified presumption is that the defeat of the central body of Communism will make it easy or easier to deal with the branch organizations.

Assuming that Nationalism will be accepted as the leading idea of the warfare, emigrant Russian nationals should be engaged in working out the neo-

RESTRICTED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

essary detailed program.

It is believed appropriate that a central staff, composed of scientists, military specialists, historians, journalists, speakers, radio commentators, lawyers, administrative executives, etc. should be created to select the best and ablest men for eventual "Provisional Government" of Russia. This purely Russian organization, during the pre-war period and during the first part of the attack, should be controlled by a highly specialized staff of Americans. It is also suggested that the political phase of warfare should be conducted by an exceptionally capable American who would have the rank and the power of a Chief of Staff, and with whom all military actions would be coordinated.

The structure of the Political Warfare Staff is a problem of secondary importance. However, the following suggestions are made: The ideological side would be worked upon by Russians, and controlled by the Chief of Operations. The materiel side would be worked upon by American specialists and controlled by a Technical Chief. This materiel branch would be responsible for the setting up and the maintenance of powerful radio stations, printing shops, for the supply of printing paper, for the employment of radio specialists, printers, etc., as well as for the transportation of the materiel and personnel.

Russian specialists would be held responsible for such tasks as: Drafting a Russian Constitution, preparing Nationalist pamphlets, leaflets, radio speeches, etc., according to the necessities of the different stages of the war.

Americans are beginning to understand the facts of Communism....but it took Trieste, Czechoslovakia, Vienna, Korea, Berlin, China, the Danube Conference, etc. to drive home the truth about the aims of Communism.

After reading speeches and articles by US politicians or the US military, it seems that the US is still reluctant to grasp the whole truth. The politicians and the military view events in the above countries singly, and not as a manifestation of a determined policy of the Communist Party. In short, the US is hesitant to believe that it has become the main target of a well coordinated political warfare, and further the US DOES NOT WANT TO REALIZE THAT THIS POLITICAL WARFARE IS ALREADY ON.

To Europeans this development has but one new aspect, namely the fact that the US has now become the principal target, all other forces opposing Communism having been largely eliminated in the course of the past war.

It is clearly discernible that the Communist Party has launched its political war against the US for the purpose of: One - disintegration of morale within the US and the undermining of the will to resist (negro problem, Wallace, strikers, etc.); two - discrediting and slandering the US abroad.

It is unlikely that the Communist Party will begin a military war before it has achieved its primary objective of winning the political war - to make resistance against the Communists impossible or at least ineffective. The USSR will rely on the unpreparedness of the US or the desire of the American Nation not to resort to any drastic measures. However, even though an

 RESTRICTED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

active military war by the US against USSR might be premature at present, an active political warfare against Communism is no longer a matter of choice, but is animpelling necessity, unless the US decides to return to isolationism. The present attitude of passive defense or disregard of the attacks of Communism spells defeat even before the first shot had been fired. The menace of Communism can be adequately met only be an active methodical and determined political and psychological warfare. Only after this action is there a chance of an eventual military victory. No atomic bombs nor any secret weapons could ever have the destructiveness or power that ideas have, and unless the US will devote as much effort to political and psychological warfare as to the construction of atomic weapons, Communism might well survive a military aggression, and eventually triumph.

5. POLITICAL WARFARE STAGE ONE

The following is an outline of active political warfare, written on the presumption that the US sooner or later will have to face the necessity of waging an active political war against Communism.

The psychological reaction of the Russian population to an aggressive bombing attack, especially if this attack were atomic, would be; panic, fear, resentment, and general chaos with most of the communications system disabled or at least disorganized, either through physical destruction, or through desertion of the service personnel.

It is reasonable to figure that this state of mind would prevail for at least three days - during which time the Communist Party would exert utmost efforts, centrally as well as locally, to regain control over the panic stricken population, and to focus the emotions of the population against the aggressor.

It is repetition to state that these first three days of the war will be decisive,psychologically and politically, for the eventual outcome of the war. Still, this repetition is necessary so as to stress the urgency that all efforts should be directed to one and only primary aim; to win the sentiments of the population for the aggressor, and against the tyrannizing minority of the Communist Party.

This can be done in the following way: (1) While the greatest part of the Communist controlled radio stations are silenced, radio stations of the aggressor should inform the population, on same wave lengths used by the Communist stations, that (a) The central leadership of the Party, Army, and the MVD do not exist any more; (b) that the war is not directed against the population, but against the Pary; (c) that the war is a Liberation War, conducted by Russian National Forces; (d) that the population is called upon to join the ranks of the Russian National Forces so as to speed up liberation.

The greatest part of the Russian population in all inhabited areas should have the opportunity to read the above statements in black and white. This should be accomplished by leaflets.

The effects of this information on the population would, in all probabil-

 RESTRICTED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

ity be enormous - especially in areas where actual air landings of Russians take place.

There is another deeply rooted grudge of the population against the Communists and their ideology - the denial of private property.

The unequal distribution of property in Czarist Russia was one of the initial pretexts of the Communist Party of that time to win the sentiments of the affected people. The collectivization of farms, nationalization of even the smallest workshops, etc., once again had created a status of social injustice felt more acutely than ever before. Later on, the blundering German attempts at redistribution of property gave the Communist Party the excellent argument that the Germans intended to reintroduce the large land and estate owners, and that these would exploit the population. This redistribution of property in Communist dominated countries would have to take place eventually, and be substituted by private ownership, and it is believed very much to the point to announce the redistribution program of property the very first day of the war.

Since it is believed that workers and farmers would be the classes to benefit most from a redistribution, it is appropriate to formulate the redistribution program provisionally so as to say that the farms would be distributed to their present farmers, factories to their present workers. This principle would be the simplest and most just, apart from the incentive this announcement would give to the appeal to the population to join the Liberation Army. Judging by the effect the Communist announcement of a redistribution of property had upon the Russian population in 1918, the effect at this date is believed to be even stronger.

However, responsible individuals as well as collective political bodies cannot be warned strongly enough to abstain from a policy of promising now and not fulfilling later. Any such tendency, creating the slightest suspicion would have disastrous results, and would cause the loss of confidence on the part of the population.

The first stage of the political warfare in Russia will be characterized by the effort: To win the favor of the population; to recruit the active aid of the population against the CP; either through encitement to sabotage, or through enrollment in the National Liberation Forces.

6. POLITICAL WARFARE STAGE II

Provided the air bombardment, the air invasion, and the corresponding political warfare actions had all been well timed and coordinated, it is believed that the 4th or 5th day of the war would necessitate different types of political actions and propaganda. The Second Stage should be primarily concerned with the organization of safety measures, introduction of new laws and regulations, recruiting and giving wider publicity to the aims of the Liberation, so as to convince the hesitant.

It is believed advisable that workers, farmers, soldiers, etc. of the liberated areas be interviewd for broadcasts. Also, priests be permitted to hold church services and a thanksgiving service on the main public square.

 RESTRICTED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Further, Russian emblems, the National banner, the coat of arms, etc. should be introduced and sponsored.

At this time, a new National currency should be introduced as the only legal tender.

7. POLITICAL WARFARE STAGE III

After the occupied or liberated areas are declared safe against aggression or partisans, administrative measures should be taken to introduce social justice and the new Constitution.

Political courts should be set up where all Communists who surrendered or were captured may be judged. Property Redistribution Courts should be set up and should register claims. Former Communist Party members should have no right to claims for property, unless they were exonerated by the Political Courts. Schools should be opened with teachers who were never CP members.

8. INTRODUCTION OF PEACE MEASURES AND CONCLUSIONS

a. Peace Measures.

(1) Three months after V-day general elections should be held.

(2) The majority of the Russian National Armed Forces should be demobilized. Only such soldiers and officers should be retained who volunteer for a peacetime National Guard. Those retained for the National Guard should be only those who have excelled in the Liberation. A decree along the lines of the GI Bill of Rights should be put into effect.

(3) Industry should be redirected to peacetime production. An industrial planning and advisory committee should be created to effect this conversion. This committee should advise but not issue orders.

(4) Currency should be stabilized.

(5) Condemned Communists should be kept outside Russian territory for at least three years after the elections.

(6) Social insurance, health insurance, old age insurance, unemployment insurance, etc. should be made compulsory.

b. Administration - The whole territory of Russia should be divided into National Autonomous Republics: Ukraine, White Russia, Armenia, Crimea, etc. much in the same way as the single autonomous Republics are defined now. The inhabitants of the Republics should be directed to hold a plebescite, to determine whether they want administrative independence from Russia; whether they want a Republic or a Constitutional Monarchy; whether they want the Monarch of Russia to be their Monarch in a "personal union", or whether they want to have their independent Monarch. It is highly probable that the majority will prefer a Republic to a Monarchy. However, it is believed appropriate to have the people themselves decide upon this question. After the major divi-

 RESTRICTED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

sions have been decided upon, further administrative subdivisions would be provinces, municipalities, and villages.

c. Elections - The Republics should be governed by the people. It would be a failure and a fallacy to reintroduce a party - majority system. It is suggested that the ancient principle of "aristo-cracy"be introduced throughout the present area of the USSR. This principle consists mainly in the free and secret election by the people of their "best" (Greek: "aristos"). In practice the village would elect its "best" man to be its mayor. The mayors of the villages would constitute the "District Council" and would among themselves elect their "best" to represent their district as the "Provincial Council". The "Provincial Council" in turn would elect their "best" man to represent the Province at the "Republican Council", an institution which would equal to that of a Parliament. The "Republican Council" in turn would elect its "best"man to represent the "Republic" at the "All-Russian" "Council". These top men, among themselves would elect their ablest man to head the Government, and the next-best men to hold the various offices of the Ministries.

The men who would eventually be at the head of the single Republics or of the All Russian Union Government, would in all human probability be adequate to their offices.

AF 127414 (Condensed D/I, ConAC) Rest

YF-86D COMPLETES FIRST FLIGHT

Designed to climb quickly to extreme altitudes for interception missions, the YF-86D - latest version of North American's "Sabre" jet fighter - has successfully completed its first flight.

The F-86A holds the world's speed record of 670.981 miles per hour.

The YF-86D differs from its record holding predecessor by having an air induct under the nose instead of in the center of the nose, and it has a larger aft fuselage section to house its more powerful jet engine. Previous models are powered by a J-47 engine without the afterburner whereas the YF-86D engine is equipped with afterburner.

The afterburner is an auxiliary source of power. Comparatively simple in design and operation, afterburning is a process of introducing fuel into the exhaust pipe and igniting it with spark plugs. The resulting exhaust gas is increased in mass and velocity, thereby greatly increasing the total thrust of the engine.

This new model has the same swept back wings with high left and lower drag that previous models have. But, this configuration combined with the added thrust, is expected to produce greater high altitude turn performance and maneuverability.

Production changes for assembly line manufacture are slight since the external configuration is similar to the F-86A. The design changes affect only the nose section structure, the arrangement of the radio and radar equipment, and slight enlargement of the rear fuselage. Provisions have been made for rapid refueling and rearming,and easy access to internal units for ease of maintenance by ground crews.

The D model, about 3 feet longer than previous models, has a wing span of 37 feet, length of 41 feet and height of 14 feet.

INTRODUCING THE GH 7A- DENSITY OF POPULATION CHART

Knowledge of where and in what numbers people are distributed over the surface of the earth is basic to an understanding of human problems of all kinds; levels of living, and economic and political relations in all parts of the world. The problems of international relations have become predominantly matters of mutual understanding and cooperation, as scientific and technological developments have increased contacts and interdependence.

The inclosed chart GH 7a, "Density of Population", brings out the several concentrations of population in China, India, Europe and Eastern United States. Reference to the Physical Relief Chart (GH 2a issued previously in Air Intelligence Review, Volume I, Number IV, 21 March 1949, will show that the bulk of the population lives in the great lowlands of less than 2000 feet altitude.

A study of the population chart will afford perspective to the implications of differences in the widely differing trends of natural increase within population groups, and to the possible consquences of new developments in the utilization of the earth's resources.

Users of this map should be aware of its limitations. It is reproduced on a small scale to present a synoptic picture of the distribution of the world's population. The small scale of the map compels generalization. The tints merge in areas of high density.

The map is based on the best censuses and estimates available, but for some Asiatic areas, it is only as reliable as available information permits. Such deficiencies, however, do not alter the world pattern.

Comparable to our federal union of 48 states, the USSR is a federation of 16 national republics. The United States contains about two million square miles of the most desirable territory in the world. (The total area of the United States is 3,022,387 square miles.) This area covers one fifteenth of the world's land area.

The population of the world (estimated as of 1948) is 2,264,409,447 people. The USSR has some 211,384,985 people - almost a tenth of the world's population. The population of the United States is 145,340,000.

Total population of North America (including Mexico and the Caribbean) is 192,656,859, while that of Europe is 380,960,346.

Asia (less USSR) has some 1,178,341, 250 people in its orbit.

These figures (all estimates as of 1948) give a good indication of population distribution in certain areas.

We ordinarily think of the earth as having a pretty large surface with room for everyone, and to spare, for its two plus billion inhabitants.

However, while there are nearly

Meet the DIRECTOR OF INTELLIGENCE

HEADQUARTERS Air Materiel Command

The Chief of the Intelligence Department, Air Materiel Command, is Colonel Harold E. Watson, whose distinguished career has admirably fitted him for this assignment. As the first American pilot to flight-test the German Me-262 and Arado-234 jet aircraft, he was awarded the Distinguished Flying Cross. For his Air Technical Intelligence accomplishments in Europe, which included command of all USTAF air technical intelligence field intelligence teams operating in that theater, he received the Croix de Guerre avec Palme and the Brevet Militaire de Pilote d'Avion from the French, and the Czechoslovakian Medal of Merit.

Immediately prior to taking over his present assignment, Colonel Watson served as Chief of the Strategic Vulnerability Branch, Hq. USAF. He also was Chief of the Industrial and Procurement Section in the Office of the Under Secretary of War.

The Colonel's first academic degree was that of Electrical Engineer from the Rensselaer Polytechnic Institute. After a period at Yale University, he went to the University of Michigan, where he received his Master's degree in Aeronautical Engineering. In addition, he has completed the course at the Industrial College of the Armed Forces.

Thus, Colonel Watson is eminently qualified to head the AMC Intelligence Department, whose primary mission is the production of air technical intelligence. "There is no Iron Curtain in air technical intelligence", is a statement often repeated by the Colonel. In demonstrating the truth of the statement, he controls the activities of scientists and engineers who are responsible in their special fields that the USAF will have the necessary information of foreign developments on which to base its own research and development program, and that technical aeronautical advances in alien countries shall be available to American industry.

COL. HAROLD E. WATSON

The many vital applications of air technical intelligence to the stra-

1582

THIS PAGE IS UNCLASSIFIED

tegic planning of our Joint Chiefs of Staff include the assessment of foreign weapons and weapons systems to determine what opposition an enemy may be technically capable of interposing to the execution of such plans. This assessment is a responsibility with which the AMC Intelligence Department is charged.

Of special interest to Reserve Officers, is the AMC Intelligence Department's responsibility for developing cadre mobile field elements and equipment for rapidly obtaining air technical intelligence in combat. An adequate training program for Reserve Officers in this work is a major commitment.

Continued from page 39

two hundred square miles of surface, over 140 million square miles are covered with water and some ten million square miles are arctic and arid desert.

Another twenty to twenty five million square miles can support little or no population since it is either arctic tundra, to mountainous or semi-arid prairies.

This leaves twenty to twenty five million square miles ranging from moderately vegetated, temperate lowlands to tropical jungles with a wide variation of desirability.

Industrial development generally accounts for the concentrations in Western Europe and the U.S. The high densities in the two areas of concentration in Asia, and in the smaller areas of the Nile Valley and the Caribbean Islands are based to a large extent on agricultural economies less dependent on modern technology.

The striking unevenness in population distribution can be explained by great differences in the combinations of many factors which include climate, soil fertility, physical relief, accessibility to the sea and to land routes of commerce, availability of raw materials, and varying development of human institutions, cultures and skills. The potential capacity of many ports of the world to take care of larger populations cannot be estimated with any exactitude. Settlement of new areas will present their difficulties. Some regions that have increased in population rather rapidly in the last few years may not be able to support larger populations than they do now, unless the engineering feats to maintain these rapid growths keep abreast of developments. Transformations in specific areas may occur swiftly, but modifications in the existing major world pattern will probably be gradual.

Air transportation is an important force in directions that have not been foreseen.

On the whole, the pattern of population is not expected to change greatly in the near future.

TITLE: The Jet Transport Flies
SOURCE: Aero Digest
ADDRESS: 515 Madison Avenue, New York 22, New York

A brief article points out that the honor of flying the first pure jet transport not modified from other designs goes to de Havilland of England. Its DH-106 Comet was flown for 31 minutes on 27 July. Avro of Canada came a close second flying the C-102 Jetliner for one hour on 10 August. A few particulars are given about both aircraft. The Comet is powered by four de Havilland Ghost centrifugal turbojets, each developing 5000 lb. of thrust. This aircraft is expected to be in commercial service by 1952 or 1953. The Avro Jetliner is powered by four Rolls-Royce Derwent turbojets producing 3500 lb. of thrust apiece.

TITLE: Non-Skid Braking
SOURCE: Flight
ADDRESS: Flight Publishing Company, Dorset House, Stamford Street London, S.E. 1, England.

An ingenious automatic control is described for nonskid braking of aircraft. The device automatically prevents skidding and is therefore capable of substantially reducing stopping distances of aircraft after landing. A further advantage claimed for the development is its potential for lengthening the life of tires. Successful tests were achieved using the device on an XB-47 bomber and a YC-97A cargo aircraft. Operation of the normal hydraulic wheel brakes actuates an electrically controlled valve unit whereby the braking pressure is thereafter kept to a value just belowthat which would result in skidding.
CADO 15 October 1949 Uncl

TITLE: National Gliding Contests

SOURCE: Flight

ADDRESS: Flight Publishing Company, Dorset House, Stamford Street London, S.E. 1, England

A gliding contest performed under difficult atmospheric conditions is described. About a dozen gliding aircraft participated in order to obtain the best showing in time in the air, gain in elevation, and distance flown. One glider achieved a gain in altitude of over 9000 ft. and covered a distance of 74 miles. Another glider remained in the air for 3 hours and 58 minutes. Conditions were such that the glider pilot needed luck to find a thermal to climb into a buoyant upper region of atmosphere and then skill to fly blind in its turbulence. The first 3000 ft. of the atmosphere were warm and laden with industrial haze. Strong sunshine was needed to cause thermals to ascend through stable air. The technique of various pilots in their attempt to utilize the atmospheric conditions is described.

WILL OF THE FRENCH PEOPLE TO FIGHT

A number of official visitors passing through Paris have raised the question concerning the will of the French people to again engage in a war should it occur in the near future.

In an effort to obtain some informed opinion on this subject, this question has been discussed with many well informed people, both French and American, who have resided in France for many years. The following comments are a concensus and it may be stated that the majority of the people had, in the main, the same opinion.

In World War I France lost some of her finest leaders. In World War II she again lost her foremost military and civilian leaders. There has been no emergence of any truly great leader in France since the conclusion of World War II. The people are not the same people as those who lived here before 1914. That is to say, they do not have the same standards, the same patriotism towards their country.

Broadly speaking, during World War I and World War II the ruling class and the peasant class of French people did not actually suffer as a result of the war. In the past war, the ruling class, i.e., the house owners, the shopkeepers, the merchants, were able to sell their goods to the Germans at high prices and make rather handsome profits. Those wars were fought between the ruling classes of different nations - between people who have been engaged in commerce and industry in the past and are likely to do soin the future. It was therefore accepted that such conflicts could always be terminated by agreement betweenthe ruling classes.

It is now recognized that World War III will not be fought on the same kind of terms as previous wars. It will be a war between the ruling classes of one nation against the working class of another. In the event of defeat of the French, the ruling class knows that their industries, their shops, in fact their way of life, will no longer be theirs and the peasants know that they will no longer own their lands but will farm them under Soviet collectivism. Therefore, it may be concluded that the ruling class and the peasant class will themselves fight to oppose any Soviet aggression.

What, however, is the attitude of the average working class in France? They do not participate in the benefits of government, they are underpaid and they lack an old age type of social security. From their point of view, any change in government would be an improvement. There is the real crux of the problem. It appears that unless the government currentlyin control of France recognizes the necessity of satisfying the needsof the average French workmen by providing a living wage and old age security benefits and takes some concrete steps in that direction then the fighting caliber of the French workmen inducted into the military service in event of an emergency would be of a highly dubious quality.

Air Attache, Paris

POLAR STEREOGRAPHIC PROJECTION
Approximate Scale at Latitude 40°N, 1:48,000,000
1 inch = 658 Nautical Miles

GREAT CIRCLE DISTANCES

The subdivided meridians, 40°E, 130°E, 50°W and 140°W, may be used as Great Circle or Nautical Mile Scales, considering the degree intervals as 60 GC miles, the 5° intervals 300 GC miles and the 10° intervals as 600 GC miles. By using a portion of one of these meridians centered on the mean latitude of the desired distance, an approximate great circle measurement may be made. For best results divide long distances into several sections and measure each section with its corresponding latitude portion of the meridional scale. The degree of accuracy will correspond with the care used.

NOTE: Pending postwar settlements, political boundaries shown are as of 1939.

AIR FORCE "AEROBEE"

A U.S. Air Force "Aerobee", upper-atmosphere research rocket, soars skyward from its launching tower at Holloman Air Force Base, Alamogordo, New Mexico, the USAF's guided missile testing center. One of 60 "Aerobee" rockets to be launched at the New Mexico installation in a two-year program of atmospheric research, this particular rocket was fired on December 2, 1949, attaining an altitude of approximately 60 miles above the earth. The 20-foot long rocket, originally designed by the Aerojet Engineering Corp., Azusa, California, and the Douglas Aircraft Company, Santa Monica, California, for the U.S. Navy, is slightly over one foot in diameter with three fins to provide stability. Powered by a liquid-fuel rocket motor, the "Aerobee" has an altitude capability of over 75 miles and has attained speeds of 3,000 miles an hour. Data collected from the 150 to 200 pounds of electronic instruments carried in the rocket will be used by the Air Force in evolving the design of guided missiles, in determining the relation between solar activity and weather changes, and as basic atmospheric information to be used in guided missile programs.

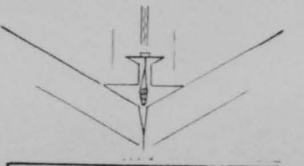
AIR INTELLIGENCE Review

This "Review" is published for three reasons:
1. To provide timely data regarding new techniques, practices and general information whereby intelligence personnel can maintain proficiency.
2. To provide material which will afford all personnel an appreciation of the intelligence role.
3. To provide a medium whereby all intelligence personnel and activities may exchange viewpoints, problems and solutions.

Two types of material are solicited for publication:
1. Stories and pictures relating to the intelligence activities being conducted within an organization.
2. Original articles of a noncontroversial but informative nature.

Material submitted must include sources utilized and the authors name, rank and present military affiliation. Mail stories to: The Editor, "Air Intelligence Review," ConAC, Mitchel Air Force Base, New York.



WARNING— THIS DOCUMENT CONTAINS INFORMATION AFFECTING THE NATIONAL DEFENSE OF THE UNITED STATES WITHIN THE MEANING OF THE ESPIONAGE LAWS, TITLE 18 U.S.C., SECTIONS 793 AND 794. The Real Meaning of

SOVIET PROPOSALS FOR CONTROL OF ATOMIC ENERGY

THE SOVIET GOVERNMENT'S PLAN FOR CONTROL OF ATOMIC ENERGY PROVES TO BE WORSE THAN NO PLAN AT ALL WHEN ANALYZED. IT PROVIDES NO REAL SECURITY AGAINST THE AGGRESSIVE USE OF ATOMIC ENERGY; WORSE STILL, ITS PROVISIONS FOR SECURITY ARE SO INADEQUATE AS TO BE ACTUALLY DANGEROUS.

THE USSR INSISTS THAT TWO SEPARATE ATOMIC ENERGY CONVENTIONS, ONE ON PROHIBITION AND THE OTHER ON CONTROL, SHOULD BE PUT INTO EFFECT SIMULTANEOUSLY. IN DOING SO, SOVIET REPRESENTATIVES DELIBERATELY IGNORE THE FACT THAT CONTROL IS A LONG-RANGE PROJECT REQUIRING EXTENSIVE PREPARATION AND CONTINUOUS IMPLEMENTATION. PROHIBITION AND DESTRUCTION OF ATOMIC WEAPONS, ON THE OTHER HAND, IS EFFECTED ONLY ONCE AND THEN COMPARATIVELY QUICKLY. BY INSISTING THAT THE PROHIBITION IN REALITY PRECEDE CONTROL, THE USSR IS ATTEMPTING TO ELIMINATE THE HEADSTART OF OTHER NATIONS IN THE ATOMIC FIELD. ONCE THAT HEADSTART IS ELIMINATED, THE USSR WILL CONSIDER A CONTROL MECHANISM, BUT ONLY ONE WHICH IS SUPERFICIAL, HAPHAZARD, AND DEPENDS EXCLUSIVELY ON THE GOOD WILL OF EACH NATION FOR ITS EFFECTIVENESS. SUCH A SYSTEM INVOLVES A REAL DANGER SINCE IT DELUDES PEOPLE INTO THINKING THAT ATOMIC ENERGY IS SAFELY CONTROLLED, WHEREAS IN FACT NO REAL CONTROL EXISTS.

IN 1947 the Soviet Union advanced a plan for control of atomic energy as an alternative to the program advocated by the majority of the United Nations. Since that time, Soviet representatives have vigorously defended their plan despite the fact that the Atomic Energy Commission of the United Nations flatly rejected it as ineffective.

Soviet conduct after submission of its plan quickly made it obvious to every member of the United Nations that the USSR had no intention of agreeing to any effective system of international control. Its strategy in proposing and championing the plan was the same as that which characterized the USSR's disarmament proposals two decades ago, when the Communists themselves said, "It goes without saying that not a single Communist thought for a moment that the imperialists would accept the Soviet proposals". With its atomic energy plan the USSR is attempting to insure a free hand for itself in its own production program by the simple device of getting other nations to commit themselves to a control system which simply would not provide control. And no matter how often the validity of the USSR's atomic control program is questioned or its worthlessness demonstrated, the proposals are continually readvanced with a bland disregard of all previous rebuttals and refutations. Soviet spokesmen have simply insisted that the USSR wants an "effective" control system. They have never once challenged the effectiveness of the majority's plan. Nonetheless, the

RESTRICTED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

USSR refuses to accept any system of atomic energy control other than its own - and that system, upon analysis proves to be worse than no system at all.

Because the proposals advanced by the Soviet representatives are formulated primarily for public consumption, and because Soviet apologists have advertised them so copiously, the layman often finds it difficult to recognize the defects and misleading aspects of the proposals and the inevitable conclusions to which they lead. On the surface the plan outlined by the USSR has a certain ring of plausibility, further enhanced by a heavy interlarding of appeals to "peace," "independence," and moral rectitude. Basically, it rests on three points: (1) Destruction of existing stocks of atomic weapons and the public declaration of all atomic facilities; (2) establishment of a control commission within the framework of the United Nations Security Council; and (3) a system of control depending on periodic inspection of declared facilities with special investigations of suspicious circumstances. In the debates of the Atomic Energy Commission, several additional factors emerged; the USSR insists on the declaration of all existing atomic facilities and the prohibition of all atomic weapons before any control system was inaugurated; the USSR insists that individual nations continue to own, operate and manage atomic manufacturing facilities; and the USSR refuses to countenance any measures of international supervision other than periodic inspections by the Control Commission of declared facilities and declared facilities only (or special investigations on suspicion of wrongdoing). Finally, the USSR refuses to permit any effective sanctions against violations of the control system; it wishes to restrict the Control Commission to recommending measures against violations to the Security Council, and the latter's action could be prevented by the veto of one of the five permanent members - including, of course, the USSR.

TIMING OF THE CONTROL CONVENTIONS

By its insistence that prohibition and abolition of atomic weapons come before a control convention is concluded, the Soviet Union has demonstrated clearly that its primary interest is not regulation of future atomic production but elimination of the headstart gained by other nations in the atomic field. The possibility of effective control after that headstart is eliminated is obviously nil.

The Soviet-proposed convention on the prohibition of atomic weapons provides no guarantee that atomic weapons stockpiles will be destroyed nor does it make any provisions to check on the destruction. Actually, the Soviet representatives have insisted that the nuclear fuel in existing atomic weapons be converted to peaceful uses, not destroyed - so "destruction of atomic weapons" apparently involves only destruction of such extraneous materials as bomb casings and the like. The nuclear fuel, which could be reconverted into an atomic bomb in short order and with comparatively little effort, would thus remain in the hands of it original owner.

In addition, the proposals give no assurance that the nations openly possessing atomic weapons will go even this far to abolish their stock nor any guarantee that nations secretly possessing such weapons will abide by the convention.

Enforcement of the provisions rests entirely on the good faith of

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

the signatory powers. Inspection of atomic facilities under the Soviet proposals could only come after atomic weapons were prohibited. And the inspection envisaged in the Soviet control, as will be seen below, is so superficial as to afford little or no assurance that either the prohibition or the control convention is being observed sincerely.

Since the beginning of discussions on atomic energy control, the USSR has been adamant on the point that atomic weapons be prohibited and destroyed before a control system can really be formulated or implemented.

It was, therefore, with a great show of cooperativeness that on October 2, 1948 the Soviet delegation announced that it was "modifying" its stand on prior prohibition. This modification consisted on conceding that "simultaneous" implementation of conventions on prohibition and control would be acceptable to the USSR. In reality, this so-called "concession" involved no change whatsoever in the USSR's previous position since no control system could be worked out in detail without comprehensive information regarding each nation's atomic capabilities and potentialities - none of which information would be given until the conventions were signed and put into force - and since in other ways implementation of any control plan would necessarily involve considerable time. Under present Soviet proposals, atomic stockpiles would be "destroyed" within three months of the effective date of the convention. The actual inauguration of the "control system" would involve, on the other hand, first, the submission by each nation of a list of facilities engaged in mining atomic raw materials and production of atomic energy, then, on the basis of this information, drawing up a program for periodic inspection, and finally the implementation of that inspection - at best a long-term matter. In view of past experience in working out technical details for international control in any field, it appears probable in this case that atomic weapons would be "eliminated" long before the control system was put into operation. It is also just as possible that obstructionist tactics - tactics of a type with which the world is all too familiar- could block permanently the establishment of any control system at all. The Soviet representative himself acknowledged that possibility quite candidly when he said, "....if there is found to be no basis for agreement, then naturally the convention cannot be concluded." Communist propaganda conveniently ignores this all-important fact. But since the USSR is clearly concerned with the elimination of existing atomic weapons rather than in real control, present and future, there appears to be little likelihood of a change in the Soviet insistence that prohibition come before control is instituted.

OWNERSHIP OF ATOMIC MATERIALS

The Soviet representative to the United Nations Atomic Energy Commission stated categorically that the Soviet Government would not consent to international ownership or international management and operation of dangerous atomic facilities. Both, he claimed, were unessential to atomic control. The USSR bases its insistence on this point on alleged concern for the principle of national sovereignty, despite assertions of reputable atomic scientists that the atomic energy industry is too intricate to be controlled by any measures calling for less than a partial abrogation of sovereignty.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Other powers of the world stand diametrically opposed to the USSR on the sovereignty question. All save the USSR and its satellites have agreed to surrender sovereign rights wherever necessary to ensure effective international control of atomic facilities. All save the USSR and its satellites are agreed that nations on whose territories such facilities are located would have to renounce certain prerogatives ordinarily associated with ownership. This does not necessarily imply the complete surrender of all rights of ownership to a Control Agency, but rather only the surrender of those rights which might impair the effectiveness of control.

The position taken by the non-Soviet world stems from the technical aspects of the atomic energy problem. At present, the principal sources of nuclear fuels from which atomic energy is obtained are uranium and thorium. Once the nuclear fuel is obtained - and the process for obtaining it is the same whether it is intended for a bomb or for peaceful purposes - only a small installation is required to turn it into atomic weapons. Such installations could be easily concealed in any country. Moreover, very little time is required for the assembling of bombs from nuclear fuel. And since the production processes utilized in making bombs are, almost to the last stages, identical with the processes involved in peaceful usage of nuclear fuels, conversion of an ostensibly peaceful installation to war production would by only a matter of days.

Because of these technical aspects of atomic energy production, two extremely serious dangers must be eliminated if, as the UNAEC puts it, "the peaceful development of atomic energy can be promoted in an atmosphere of confidence and general trust." Under present conditions atomic materials can be diverted comparatively easily from legitimate uses and/or can be manufactured secretly in a world that is apparently at peace. The AEC considers that any effective plan for the general international control of atomic energy must provide against these two dangers.

Considering the Soviet proposals in the light of these technical aspects of atomic energy control, the irreconcilability of complete sovereignty and realistic control at once becomes obvious. Without international management and operation of all atomic facilities, it is technically impossible to eliminate the dangers of diversion and clandestine activity, since these dangers exist at every stage of the process from the mining of the raw materials to the completion of the final product. Only a continuous inspection of each and every operation could guarantee against possible mal-practices - and as the Soviet representative argued, continuous inspection of any one operation "ceases to be inspection and becomes supervision or management." The Soviet Government more than once declared international management and operation to be the equivalent to international ownership, and thus an infringement on national sovereignty, a proposition which the USSR refuses to accept.

While no one has contended that an effective control system agency will not require surrender of some of the attributes of sovereignty heretofore exercised by the individual state, it has never been suggested that complete ownership rights (i.e., complete sovereignty) on atomic matters devolve on the Control Agency. For example, quotas for production and consumption of nuclear fuel and the production policy itself would be

1600

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

beyond the jurisdiction of any Control Agency since these provisions would be laid down in advance by the control convention. The Agency would be unable to manage or dispose of materials and facilities arbitrarily or for its own profit since it would only be holding these in trust forthe member states for their benefit. Nor could the agency close atomic plants arbitrarily or construct plants at will, except with the agreement of the nation concerned. It would also have to conform to national legislation in such matters as public health, working conditions, and labor standards. In effect, individual nations would be required to renounce only those rights which, if unchecked, could impair the effectiveness of the control program.

PERIODIC INSPECTION AND INVESTIGATION

The USSR has refused to consider any control system which involves "international management and operation." It has proposed instead an International Control Commission which "shall periodically carry out inspection of facilities for the mining of atomic raw materials and for the production of atomic materials and atomic energy." Unemphasized is the fact that inspection under the Soviet plan, would be limited to only those facilities declared by the individual state to comprise its atomic industry. No provision is made for cases of falsified declarations.

The Commission's functions in the periodic inspections would consist of investigations of mining and production facilities declared by the governments, accounting for raw materials, "observing the fulfillment of the rules.....prescribed in the convention on control," collecting and analyzing requisite data, and submitting recommendations to the Security Council and the individual governments. To fulfill its functions, the Commission would have access to all declared atomic facilities and operations, it would carry out "weighing, measurements and various analyzes" of atomic materials, and would request the individual government to provide any information on atomic activities.

On the surface, such measures appear to provide a fair degree of checking, if not of actual supervision. When viewed against the complexities of the present-day atomic industry, however, it soon becomes obvious that the merits of such a plan are nil.

Actually, the traditional Soviet policy toward foreigners would restrict the operations of an inspection team in the USSR itself to less than a necessary minimum. The stringent and evergrowing Soviet obsession with secrecy hardly supports a hope that the Kremlin is willing to reverse its traditional policy toward outsiders even for atomic energy control.)

Again, it is the technical complexities of atomic energy production which render the Soviet proposals inadequate for real control. Not even the Soviet representative has been able to show how periodic investigations could determine accurately the amount of material being processed in plants at the time of inspection, nor the amount which has been processed between inspections. Without these checks, there is no way of knowing what quantities of atomic materials are in the hands of any country.

Since no production can take place at present without uranium and thorium,

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

physical control over these materials and their fissionable derivatives must be maintained at all stages, from their extraction to their use as nuclear fuels. Accounts cannot be verified without continuously checking on the grade of the ore extracted from a given mine (and grades may vary from one place to another in the same mine), or on the daily output or on the amount shipped for refining. The same precautions must be exercised with regard to uranium and thorium processing and purification plants and all other plants using or producing nuclear fuels. Because of the large number of complex stages in the process, and because of the remote control operations where highly radioactive and toxic materials are involved, it is impossible to check the amount of material in process at any one moment or on the elemental changes such materials undergo in an atomic pile. Nor could periodic inspection provide any definite knowledge of the rate at which such fuels were produced or consumed between successive inspections. Only the management of the plant itself would be in a position to keep check on the nuclear fuels involved. If the international control agency itself were not managing the facilities, the international inspectorate would have to depend solely on data accorded it by the individual government. It would be impossible to verify such data with any degree of accuracy without continuous supervision of the facilities, i.e., without international management.

The periodic inspections and special investigations provided in the Soviet plan offer no safeguard against clandestine activities on the part of a nation which would deliberately set out to violate the control convention. "Special investigations" are supposed to cover such eventualities, but special investigation can be undertaken only when "suspicion of violation arises." As shown above, the periodic inspections would be of such limited nature that there would hardly be opportunity for the international control commission to become suspicious.

In addition to the limitations outlined above, the Soviet Government has specifically refused to agree to a provision granting the commission the right to control explorations for mineral resources to determine whether a country has uranium and thorium ores or has discovered new sources of nuclear fuel. It has refused inspection of activities related to and used primarily for nuclear fuel production, such as the production of pure graphite, heavy water or of centrifuge pumps, diffusion barriers, etc. Nor will the USSR permit inspection of laboratories engaged in "scientific research in the field of peaceful uses of atomic energy," except for periodic inspection of those laboratories known to be working with dangerous amounts of material. And, of course, the inspectorate can check only declared installations and cannot on its own ferret out any secret activities.

The USSR has generally discounted or ignored the entire question of secret activities. As one Soviet delegate put it, "Governments responsible under the convention for the implementation of measures on their territory take the obligation to implement the convention, and from this it follows that secret activities would be excluded." In view of the USSR's past distrust of good faith alone as a basis for international agreements (and the hard bargains driven by Stalin in return for Soviet "good faith" at Yalta and Potsdam), such an assertion in the case of atomic energy appears rather

1602

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

startling.

CONTROL AND SANCTIONS

The only guarantee of workability in the Soviet atomic energy proposals is the good faith of the nations involved. No provisions are made for stronger sanctions in cases where national ambitions override good faith. Only two regulative powers are assigned the Control Commission, the power to make recommendations to the individual governments on questions relating to the production and use of atomic materials, and the power to recommend to the Security Council measures for handling violators of the prohibition convention. The commission would have no power to prevent or stop violations of the conventions on the spot. It would have no right to guard stockpiles or halt production for inspection purposes if evidence of malpractice is detected. Its only recourse would be reliance on the good faith of the nation concerned, or on recommendations made to the Security Council. The Control Commission itself would be powerless to act where immediate action is essential; only the time-consuming procedure of the Security Council could determine what action, if any, should be taken. And, of course, the five great powers maintain the right to veto any decision of the Security Council, and can thereby block any action inimical to their own interests.

Under such a control system, no real security or control exists since the organization entrusted with the problem has no power to cope with a situation requiring quick action. A nation bent on violating the terms of the control conventions could continue its transgressions for a substantial period of time without risking sanctions. And even if measures were decided upon before the nation in question used its atomic stockpile aggressively, there is no guarantee that the measures could be applied effectively short of war between the UN and the guilty party. The Soviet proposals not only fail to provide the security required of any system of international control of atomic energy but are so inadequate as to be actually dangerous - giving an illusion of security with no foundation.

MOTIVATION OF THE SOVIET PROPOSALS

The primary objection to the entire Soviet concept of Atomic Energy Control is the fact that the Soviet system provides no guarantee of fulfillment, other than the willingness of the individual nations to cooperate. And few nations are willing to accept a Soviet-inspired convention based on good faith after taking into account the USSR's past record on international agreements.

It is well known that Marxist theory in Soviet practice justifies the use of any means to bring about the downfall of capitalism. The writings of Lenin and Stalin afford ample evidence that Soviet leaders intend to advance and are advancing the cause of Communism by whatever methods best serve their purposes. These methods may at a given moment be reproachment with capitalist countries (e.g., the wartime alliance of the Big Three) or cold war with capitalism. The USSR will, when necessary, become party to an international convention if such a convention serves its immediate purposes. It will just as readily violate that convention with or without pretext if violation is more to the USSR's advantage than "observance." The fate of the nonaggression treaties with Estonia, Latvia, and Lithuania are but three examples of Soviet

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

policy in treaty fulfillment. In the words of Lenin, Communism "recognizes all methods of political struggle, as long as they correspond to the forces at the disposal of the Party and facilitate the achievement of the greatest results possible under the given conditions." "We must agree to any sacrifice, and even - if need be - to resort to all sorts of stratagems, manoeuvres, illegal methods to evasions and subterfuges."

It is in the light of this philosophy, still preached today as guidance to the Communist Party and the Soviet State, that every Soviet proposla must be judged. Generally, the motivation is far more important than the intrinsic merits of the proposals. The completely unrealistic nature of the atomic control system advocated by a state noted for its cynicism in international affairs would substantiate the belief that the USSR's entire stand on atomic control is merely a tactical maneuver. The desire for control is clearly outweighed by the desire to exploit the atomic controversy for propaganda purposes - and thus gain time to overtake the United States in atomic development. Just as the Communists said in 1928, disarmament proposals "must not be utilized as a pretext for advancing similar demands (i.e., for disarmament) in capitalist countries, but as a means: (1) For recruiting sympathizers for the Soviet Union - the champion of peace and Socialism; (2) for utilizing the results of the Soviet policy.....to carry on propaganda among the masses in support of the only way toward disarmament and the abolition of war, viz. arming the proletariat, overthrowing the bourgeoisie and establishing the proletarian dictatorship."

The Soviet proposals for disarmament and for atomic control were not intended for serious consideration. Both served the Soviet policy of the moment. In 1928 it was advantageous to demand disarmament and decry sovereignty in order to weaken capitalistic states. Two decades later, sovereignty is defended at all costs as an essential safeguard to the USSR's own policy of nationalism. Not only has the USSR reversed its position, but now it has even managed to advocate both sovereignty and disarmament in connection with atomic control.

Perhaps the entire stand taken by the Soviet Union on the question of atomic energy control - and with it of disarmament and peace - can best be summed up in the words of a Comintern document which outlined the policy to be followed by Communists in exploiting the entire question of "peace" for Communist purposes. The real intentions motivating the Soviet proposals are stated baldly, albeit in Marxian double talk, when the Comintern declares: "There is no contradiction between the Soviet Government's preparation for defense and for revolutionary war and a consistent peace policy. Revolutionary war of the proletarian dictatorship is but a continuation of revolutionary peace policy 'by other means'."

F2H-1 BANSHEE-

TWIN-JET LOW-WING CARRIER BASED FIGHTER

The Banshee bears marked resemblance to the Phantom. The main recognition difference is the absence of dihedral in the stabilizer of the Banshee. Other improvements have also been made, such as, making the outer surfaces appreciably smoother, constructing the wings and tail considerably thinner and increasing the pilot's visibility. The engines are almost twice as powerful as the Phantom's, thereby, creating much better performance. The F2H-1, like its predecessor the FH-1, is designed to cruise on one or two engines. The jet units are placed close to the center line of the airplane so that very little yaw results when one engine is shut off.

MANUFACTURER: McDonnell
DIMENSIONS: Span - 41' 6" (folded 14'); Length - 40' 11"
ENGINES: J-34/3000 lb thrust
SPEED: 510 knots/sea level
RANGE: 1185 nautical miles/291 knots
ARMAMENT: (4) 20 mm. cannon

100 THINGS YOU SHOULD KNOW ABOUT COMMUNISM AND RELIGION

PART I OF II PARTS

This is to tell you what will happen to YOU and YOUR CHURCH if Communism ever takes over the United States of America.

The long and the short of it is just this: You cannot be a Communist and believe in God. You cannot believe in God and have a peaceable life under Communism.

In all their plans and actions, the Communists mark down religion as Enemy No. 1. Where they dominate, they attack it head on. Where they do not dominate, they try to deceive and to corrupt from within just as they do in government, in education, in labor unions, and throughout a nation's life in general.

The aim and object of Communism is always the same -complete control over the human mind and body, asleep and awake, in sickness and in health, from birth to death. That is why Communism marks religion Enemy No. 1, for religion in some form is always a basic influence in the life and thinking of any people.

Communism cannot dominate family life, for example, until it has first fought its way past the influence of religion upon the family.

Communism cannot force its own brand of moral code upon a person without first destroying his moral code rooted in religion.

Communism cannot make education a weapon in its hands so long as religion is secure in its own right to teach and to educate.

Communism cannot dominate unless it has the power to remake the life of the people. It cannot ignore religion and do that.

So here, then, is a report on what Communism seeks to do about religion in the USA., as judged by what it has already done elsewhere and has SAID it will do here at the first opportunity:

1. IF COMMUNISM SHOULD COME TO THE UNITED STATES, COULD I BELONG TO A CHURCH?

You would have to choose at once between church and Communism. If you should choose the church, then prepare for persecution.

2. WHAT WOULD THE COMMUNIST DO TO CHURCHES AND SYNAGOGUES?

Take them over and put an end to the freedom now guaranteed by Sentence One, Article One in the Bill of Rights of the Constitution:

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Congress shall make NO law respecting an establishment of religion or prohibiting the free exercise thereof.

3. WHAT DOES THAT MEAN, EXACTLY?

Just study for a minute these figures on the present size and nature of religion and its works in the USA:

256 denominations

253,000 churches and synagogues

77,000,000 members

162,000 Sunday schools

13,000 parochial schools

690 colleges and schools of higher learning

Libraries, radio stations, publishing houses for books, magazines and newspapers.

Charities, orphanages, hospitals, missionary forces

Ladies' aids and auxiliaries. Men's societies, young people's organizations, childrens groups

These are what Communism would like to take over and destroy.

4. WOULD THE COMMUNISTS DESTROY THE BIBLE?

Every copy they could find. And they would jail anybody trying to print new copies.

5. COULD I BE MARRIED IN THE CHURCH?

Not legally.

6. COULD MY FUNERAL BE HELD IN THE CHURCH?

Not legally.

7. COULD MY CHILD BE BAPTIZED OR CHRISTENED IN THE CHURCH?

At the risk of prison for parent and pastor.

8. WOULD MY CHILD GO TO SUNDAY SCHOOL?

Not only would Sunday school be illegal, but also your child would be taught to report you to the police for trying to send him.

 RESTRICTED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

9. HOW WOULD MY CHILD LEARN HIS RELIGION, THEN?

Only through what you might tell him at home, to offset the positive atheism he would learn all week at the government school.

10. YOU MEAN THE GOVERNMENT WOULD TEACH ATHEISM?

Yes. Here is the rule laid down by Nikolai Lenin, leader of the Communist revolution in Russia in 1917 and founder of the Red government now headed by Joseph Stalin:

Down with religion! Long live atheism! The spread of atheist views is our chief task!

That rule has not changed.

11. COULD I GIVE MONEY TO THE CHURCH?

Yes, if the Communist system would allow you any; but then most of it would go for staggeringly high taxes, rent, and other fees charged by the government to discourage church operations. Anything left could go to feed the preacher, who would be little better off than a beggar, anyhow.

12. WHO WOULD OWN THE CHURCHES?

Under Communism, churches and synagogues could no longer own their own property, free, clear, and untouchable, as they do in the United States today. Church property would become government property. Congregations could only use such small rooms or buildings as the government might license to them on concession.

The fees and charges for this would be heavy and all use would be subject to strict Communist control, review and supervision.

13. HOW ABOUT MY OWN CHURCH-GOING?

You could try on your own time, if the Government happened at the time to let you off work on a holy day. Otherwise, only at night, when and if you get the chance.

14. WOULD I BE ALLOWED TIME OFF FOR RELIGIOUS HOLIDAYS AND CELEBRATIONS AS NOW?

Not a chance.

15. COULD I HELP OUT WITH CHURCH CHARITIES AND WELFARE WORK?

There wouldn't be any. All church schools, hospitals, orphanages, asylums, and such things would be seized by the government. Religion would be denied any say in their use or management.

16. WHAT ABOUT MISSIONARY WORK?

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Illegal. Forbidden.

17. COULD WE PRINT THE SERMONS, CHURCH NOTES OR NEWS LETTERS?

Certainly not. Only atheistic views could be distributed and, of those, only such as the government would hand out in official form. Under Communism you wouldn't even be free to peddle your own brand of atheism - just the government's.

18. HOW ABOUT MY CHURCH MEN'S CLUB, LADIES' AID SOCIETY, OR YOUNG PEOPLE'S GROUP?

Out. There is no freedom of assembly under Communism.

19. WHAT COULD MY PASTOR DO?

In the pulpit, he could lead the congregation in acts of faith and deliver sermons, with the Communists checking on every word.

Out of the pulpit, he would be an official target for abuse, ridicule, and scorn, under constant suspicion, and in danger of his life.

20. WHY?

In him, the Communists would see a rival to their power over your mind, imagination, and will. The faith your pastor teaches is Communism's deadliest enemy.

21. WHAT DO YOU MEAN BY "FAITH"?

The sort of thing you find in the Ten Commandments and the Sermon on the Mount.

22. WHAT IS THE COMMUNIST FAITH?

"Marxism-Leninism," as operated by Joseph Stalin.

23. WHAT'S ALL THAT?

A plan and method to rule the world.

The man who drew up the plan was Karl Marx, who lived from 1818 to 1883.

The man who put the plan into action in real life was Vladimir I. Ulyanov, alias Nikolai Lenin, who lived from 1870 to 1924, and led the world Communists to capture Russia in 1917-18.

The man who made the plan a world force was Josif Vissarionovich Djugushvili, alias Josif Stalin, now living, and 67 years old, who followed Lenin in command of the world Communist conspiracy.

1608

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

24. WHY DO YOU SAY "ALIAS LENIN" AND "ALIAS STALIN"?

Because those are not the real names of the men involved.

Remember, the present "Stalin" started out in life to destroy the government of his own country and rebuild it on Communist lines through bloody revolution, and that's how it was actually done.

He was against all law except Communist ideas as laid down by Karl Marx. He used the alias "Stalin" to hide his real identity, just as Ulyanov used "Lenin."

25. WHAT WAS MARX' IDEA OF A COMMUNIST WORLD?

That the world as we know it must be destroyed - religion, family, laws, rights, everything. Anybody opposing was to be destroyed, too.

Marx wanted a world in which people owned no property, took orders from the Government without question, and let their family life - husbands, wives, parents, and children - be without religion, morals, or ideals as we know them.

26. WHAT WAS HIS IDEA OF MORALITY AND FAMILY?

That anything is moral - even lying, stealing, and murder - if it brings on Communism.

That women should have children for the Communist state to educate, train, and use, but parents should not have any say in training according to their OWN IDEAS.

That there is no need to fear God because He does not exist.

Marx had the idea that people could never be happy, have enough to eat, make enough money, or have success in the kind of world we know.

The USA is living proof that he was as wrong as a man can be.

27. WAS MARX CRAZY?

Perhaps. But Marx was not the first evil and crazy man to start a terrible world upheaval, nor was he the last. Hitler was like that, too, but look at what he did.

28. HOW DID ANYBODY FALL FOR MARX?

Some overlooked his craziness because he was one of the most effective propagandists who ever lived.

His preaching of destruction appealed especially to people who wanted to rule others and didn't know how. It still does.

29. WAS LENIN ONE OF THOSE POWER SEEKERS?

RESTRICTED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Yes. Lenin was the son of a minor Government clerk. He had a terrible thirst for power.

Early in his life he read Marx, caught the idea of forming Communist cells of revolution as Marx planned them, and built a conspiracy to capture his country.

When Russia's Czarist Government crashed in the war of 1914-18, it was followed by a Republic organized along the lines of our own. But before the Republic could really take hold, Lenin's Communists came out from under cover, confused the public mind by propaganda, stirred a military revolt, slaughtered all opposition and set up by force of arms a Communist dictatorship. They still have it today.

30. DID ALL THE RUSSIANS TURN COMMUNIST?

Neither then nor now. Only a few trained and disciplined favorites were or are allowed to be Communists.

For a general picture of what kind of people turn Communist and what they do, see the first of this series, entitled "100 Things you Should Know About Communism in the USA". (Int. Information Bulletin #8, 15 Oct 48)

31. WHY DO ANY PEOPLE FALL FOR THEIR LINE?

They promise all the things that people have always sought - an easier life, an end to trouble.

32. DO THEY DELIVER?

Of course not.

Once they get in control, they reduce a nation to horror and slavery. Look at the record, not only in Russia but in all other countries captured by Communism.

33. HOW DO THEY KEEP GOING?

The secret of Communism's drive and the real key to the Communist faith is the dream of total power for Communists, loss of power for all others. That's the story in a nutshell.

34. WHERE IS THE HEADQUARTERS OF THE COMMUNIST FAITH?

The Kremlin, Moscow, Russia.

35. WHO IS THE HEAD OF THAT FAITH?

Joseph Stalin, because he is the head of the Government of Russia and Chief of the Communist Party of Russia. To a Communist in the United States or any other country, Stalin's word is final.

 RESTRICTED

1610

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

For a Communist to defy Stalin is as scandalous to other Communists as for a religious-minded person to blaspheme God.

36. IS THERE ANY PROOF OF THIS?

Examine the record in Russia, Latvia, Lithuania, Estonia, Poland, Czechoslovakia, Hungary, Rumania, Bulgaria, Yugoslavia, Austria, Germany, and in all other countries where Communism takes any hold.

Add to it the thousands of volumes of Communist official literature collected in the Library of Congress here in Washington.

Measure against your common sense and decide for yourself. In the meantime, here following are significant highlights from that record dealing with just one side of the story, Communism's war on religion all over the world, including the United States of America.

37. WHAT ABOUT RUSSIA?

Let's flash back. The number of congregations has dropped since 1917 by more than 75 percent. That any have remained at all is triumph of survival against relentless, cruel, and powerful persecution.

38. WAS RUSSIA A VERY RELIGIOUS COUNTRY BEFORE?

About half the people of the old Russian Empire belonged to the Eastern Orthodox branch of Christianity. The Orthodox Church was recognized and established as an arm of the Government.

Beyond the established church, there were congregations of Roman Catholics, Protestants, Jews, Mohammedans, and other faiths, even ancient tribal pagan groups.

None beyond the Orthodox Church was recognized as legally "established" by the Government, but they were at least tolerated. They are not even TOLERATED now. Only the Orthodox sect is allowed any activity at all.

39. WHY IS THE ORTHODOX CHURCH AN EXCEPTION?

Its priests are today held captive by the Communists and used to help rule the Russian people.

40. HOW DID THE COMMUNISTS CAPTURE THEM?

By destroying the independent power of the church and then taking advantage of the determination of many people to have a continuing religious service on any terms.

41. WHAT WAS THE FIRST STEP?

All Orthodox Church property, right down to the crucifixes and altar vessels, was seized. All monasteries closed. Churches turned into movie houses and

1611

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

museums. Church bells destroyed.

42. HOW WERE ORTHODOX PRIESTS TREATED?

Thousands were slaughtered. Others were ridiculed and kicked through the streets. As a class, they were held up to the country as parasites and frauds, and refused permission to travel, meet in groups, or to train or ordain others.

43. HOW ABOUT THE OTHER FAITHS?

Treated even worse, since they represented minority groups.

44. WHAT ELSE HAPPENED?

Official Government agencies were set up with the taxpayers' money to operate "antireligious museums" and to publish books, posters, pamphlets and magazines denouncing religion. Atheist carnivals were held on religious holidays. Christmas trees were banned. Sunday was decreed a workday to stop devotional services, and failure to report for work on a religious day meant instant dismissal. Religious oaths were abolished.

Atheism was taught in the schools as a required course for all children. Radio broadcasts by Government propagandists dinned atheism into people's ears night and day. Communists who showed any interest in religion were expelled and ruined. Priests and their families were made outcasts of society, refused jobs or food-ration cards, and forced to pay extra rent and taxes.

Orthodox priests are allowed to marry, so the Government even took it out on their children by refusing them so much as a high school education.

Non-Communists who stood by their religion lost their jobs and generally were shoved downhill by the full force of government.

45. WAS ALL THIS EFFECTIVE?

Figures on congregations and church organizations in Soviet Russia vary, but over-all they show a general reduction in church organizations of 75 to 90 percent over a 25-year period. The number of priests in the Russian Orthodox Church was reduced from nearly 51,000 down to less than 6,000. Orthodox Churches dropped from 46,000 before the Communists took over to 2,000 in 1948.

However, religion went underground as a result of persecution, and a vast network was created in which priests carried on religious schools and services in secrecy and survived in disguise with the help of the general public.

It has been estimated that today there are, in addition to the nearly 6,000 registered priests mentioned above, another 5,000 under cover; there are at least 2,000,000 children in underground Christian youth organizations; and there are between 67,000,000 and 80,000,000 adult believers in Russia.

46. ARE THE COMMUNISTS SATISFIED WITH THE DAMAGE ACCOMPLISHED SO FAR?

No. They will never accept as final anything less than the complete end of religion.

STATUS OF AERIAL PHOTOGRAPHY OF THE UNITED STATES

The inserted index map entitled "Aerial Photography of the United States" is the fourth edition of a series which is intended to present a periodic inventory of areas that have been photographed or are about to be photographed. The third edition was published in April 1948. Since then many new photographic projects have been completed, other areas have been scheduled for new photography in the near future, and numerous reports have been received from state and commercial agencies regarding new photographic holdings. All of this information has been utilized in revising the third edition to produce the present map which is corrected as of June 1, 1949. The frequency of revision will be governed by the number and rate of changes pertaining to aerial photographic coverage.

GENERAL PROCEDURE FOR PROCUREMENT OF AERIAL REPRODUCTIONS

Anyone desiring to obtain aerial photographs for a given area may determine from the status map whether photography is available and also the agency which holds the film. When photographs are for military usage, normal military channels will be used; inquiries concerning procurement for other reasons should be sent directly to the appropriate agency. It is advisable to include a sketch or detailed description of the area of interest and also to specify the type of reproductions desired - contact prints, enlargements, or photo index sheets. In each case, reproductions must be ordered from the agency having custody of the film - there is no central laboratory which can furnish prints from all Government photography. Related data such as scales, dates, and lens focal lengths are also available from the film-holding agencies.

For the coverage designated on the status map as "States and Commercial", "Secondary Photography", or "New Photography In Progress", the name of the agency or organization may be obtained upon request from the Map Information Office, Dept. of the Interior, Washington, D. C.

SOURCES OF REPORTS

The accompanying index map has been compiled by the Map Information Office on the basis of reports of existing and proposed new aerial photographic coverage. Reports from the commercial and state organizations were received in response to a general invitation made to all such active organizations in the past.

NEW PHOTOGRAPHY

In addition to the existing aerial photography, areas which are under contract or which are otherwise definitely scheduled for new photography, are indicated. However, due to the limitations in showing a number of different classifications on one map, no attempt has been made to indicate which agency may be obtaining the new photography; that fact should be ascertained by inquiry to the Map Information Office. In areas

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

previously photographed, scheduled new photography may very likely be for a different agency than the one having the existing photography.

GENERAL TYPES OF PHOTOGRAPHY

It is not possible to show clearly on this index map any details pertaining to the scale of the photographs, the focal length of the camera lenses, and the date of photography. However, general information regarding the types of photography obtained and used by the principal agencies may be summarized as follows:

The Production and Marketing Administration, the Soil Conservation Service, and the Forest Service, of the Department of Agriculture, usually require an 8 1/4 inch nominal focal length lens and a scale of about 1:20,000. In a few cases, scales of 1:15,840, 1:31,680, and 1:40,000 have been required. In general, the photography was obtained between 1936 and 1949. Worthy of mention are several instances where the Forest Service is obtaining infrared aerial photography for classification studies.

Practically all of the Geological Survey photography was taken primarily for topographic mapping either with 6 inch, 5.2 inch, or 4 inch nominal focal length lenses. The scales of the photography vary considerably, being governed by the desired map contour interval. As an example, in some areas the scale is as large as 1:12,000, while in others it may be as small as 1:56,000. In a few cases, aerial photography intended for map revision was taken with an 8 1/4 inch lens. The major part of all the photography was obtained since about 1939.

The photography of the Tennessee Valley Authority may be divided into two general classifications. For mapping, practically all of the area shown was photographed with 4 inch lenses, the resulting exposures being 7 x 7 inches in size. In addition, considerable special-purpose photography at scales larger than 1:20,000 was taken with 8 1/4 inch, or larger, focal length lenses.

Existing photography of the Bureau of Reclamation was taken with various focal lenses—6 inches, 8 1/4 inches, 12 inches.

The photography of the Coast and Geodetic Survey is generally either 1:10,000 scale or 1:20,000 scale. A part of it was taken with the special nine-lens camera, the remainder being taken with single-lens cameras either of 6 inch or 12 inch nominal focal length.

The aerial photography of the Corps of Engineers and the United States Air Force varies so widely as to scales and types that no reasonably accurate generalized description may be given. Lenses of various focal lengths were utilized. A great variation in flight altitudes resulted in a wide range of scales.

The photography obtained by the commercial firms and the state agencies also varies considerably as to scale, focal length of lens, and type. Since all commercial firms and state agencies are grouped under one color legend on the map, a prospective user should first ascertain from the Map Information Office which firm has the photography he desires, after which detailed information may be sought directly from that firm.

AREAS REPHOTOGRAPHED

In many cases areas in the United States have been photographed more than once. This is occasioned by

RESTRICTED

1614

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

several major considerations. First, in many areas, cultural and physiographic features on the ground do not remain the same. Changes are constantly taking place - new highways are constructed, dams are built and areas are flooded, forests are cut and farms are established, the courses of streams are altered, and other similar changes occur. Obviously, for any use which requires a correct knowledge of features as they currently appear on the ground, the photographs must be of recent origin. Also, when photographs are to be used for preparing maps, it is often required that they be taken in seasons when deciduous trees are bare of foliage. Consequently, new photographs are often necessary to replace those several years old or those taken during late spring or summer. The second consideration is purely a technical one. Modern, accurate maps are most economically and efficiently produced by the use of aerial photographs and stereoscopic plotting instruments. However, the plotting instruments require certain types of photographs. Most of the instruments in use require aerial photographs taken either with a 4 inch, a 5.2 inch, or a 6 inch nominal focal length lens. Now diametrically opposed to this consideration is the fact that for general land-use studies, planimetric work such as acreage measurements and direct distance measurements, the preparation of mosaics, and other allied non-stereoscopic uses, photographs taken with a longer focal length lens are much more desirable. Practically all photographs obtained for those purposes are taken with lenses of at least 8 1/4 inch, and often 10 inch, focal lengths. Consquently, except in rare cases, one type of photograph will not be economical for the uses mentioned above and for concurrent use in map plotting instruments. This consideration has often resulted in more than one set of photographs for the same area.

SELECTION OF COVERAGE FOR AVERAGE NEEDS

In areas where two or more sets of photographs exist, the set which is judged to be most suitable for average needs has been designated as primary photography and shown by color pattern on the index. The existence of other coverage for the same area, designated as secondary photography, is shown by a pattern of black diagonal lines. Therefore, black diagonal pattern will indicate all areas that have been photographed more than once. This method of presentation necessitated arbitrary selection.

The selection of the coverage to be shown as primary photography was based on three main considerations - utility for average needs, age of photography, and scale. Without exception, preference was first accorded to single-lens vertical photographs. Multiple-lens vertical photography was only shown in color where no single-lens vertical coverage existed. In cases where there were more than one set of single-lens vertical exposures, age was the most important factor and scale was of secondary influence in governing the slection. Therefore, in many cases, the coverage indicated in color pattern is that most recently obtained even though it may be at a small scale, while photography several years older, but at a larger scale, was classed as secondary photography to be shown in black pattern. Of course, there was a reasonable limit to this conception, and in some cases new photographs of extremely small scale were subordinated in favor of coverage several years older having a considerably

1615

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

larger scale.

Records of all photographic coverage are maintained in the Map Information Office. The names of the agencies having the secondary photography of any area can be readily obtained from that office upon request.

GENERAL

The Map Information Office is interested in receiving information pertaining to any existing photography for those areas which appear on this map as not having been photographed. While the search for coverage information has been thorough, it is conceivable, and even likely, that for some of the areas indicated as unphotographed on the index, photography is in existence and may be held by an organization or concern which would be willing to make reproductions available. Notification of any cases of this nature will be appreciated.

RESERVE ACTIVITY

The 50th Fighter Wing (Jet), United States Air Force Reserve, one of the first corollary units to be activated, is an excellent example of effective Air Force personnel procurement technique. Prior to activation of the Reserve Wing in July 1949, Colonel Bruce Johnson, Commanding Officer of the 50th, personally screened the records of officer and airmen applicants in order to insure an efficient operating unit.

Letters were then dispatched to the accepted personnel inviting them to Otis Air Force Base to meet their regular counterparts in the 33rd Fighter-Interceptor Wing, commanded by Colonel Arthur Agan. Wholehearted cooperation on the part of the staff of the 33rd permitted rapid mission familiarization, a long stride toward operational readiness.

The introductory intelligence training was devoted primarily to organizational equipment orientation and conducted tours by such qualified men as Major Donald W. Wantz and Lt. James Pressley. This was followed by specialized training embracing all phases of operational intelligence. A series of simulated problems including operations orders, reports, briefing and interrogation, situation maps and a final critique were undertaken. An excellent example of the simulated problems was the imaginary invasion of the Northeastern United States by a hostile force.

Indicative of the efficiency of the 50th Fighter Wing and the interest its training program has aroused, is its attendance record. Of a total strength of 96 officers and 400 airmen, the attendance has averaged 100% and 80% respectively.

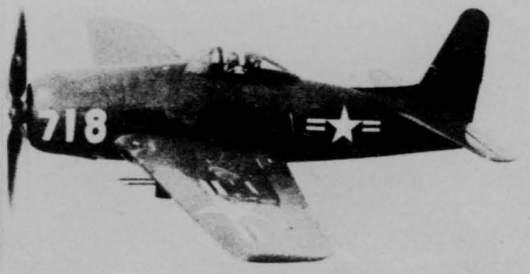
NAVY AIRCRAFT



F8F-2 BEARCAT-

SINGLE-ENGINE MID-WING CARRIER BASED FIGHTER

The evolution of the Grumman fighter has produced this high speed, very maneuverable little fighter, which was with fleet units just prior to VJ-day, but too late for actual combat. Powered with the same horsepower engine as its predecessor, the Hellcat, the Bearcat is lighter, smaller and much cleaner in design. Along with the Corsair it is the Navy's first line conventional engine carrier based fighter. Recognition characteristics are the familiar Grumman stubby fuselage, high bubble canopy and tapered low mid-mount wing with blunt tips. The F8F-2 shown here is actually the same as the F8F-1 with the exception of two 20 mm. cannon.

MANUFACTURER:	Grumman
DIMENSIONS:	Span - 35'6" Length - 27'6"
ENGINE:	R-2800/2380 h.p.
SPEED:	370 knots/19,900 ft.
RANGE:	1,140 nautical miles/140 knots
ARMAMENT:	(4) .50 cal. guns or (4) 20 mm. cannon

F9F-2 PANTHE

SINGLE-JET MID-WING CA BASED FIGHTER

The Panther is the first jet plane produced by Gr has very few of the familiar Grumman recognition c istics. The pressurized cockpit is located far f the thick fuselage. The intakes for the single ce flow type jet engine, located in the fuselage a pilot, are in the leading edge of the wing roots. haust is out of the ventral side of the fuselage f the rudder extremity. A "droop snoot" wing is inc to improve landing and take-off charcteristics. ble nose section permits rapid changes of armame tronic or camera equipment to suit the type of miss duction version includes a pilot ejection mechanism

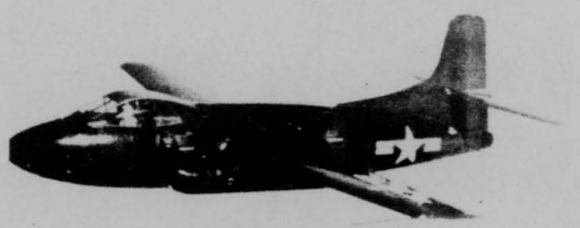
MANUFACTURER:	Grumman
DIMENSIONS:	Span - 35' 1" Length - 37' 8"
ENGINE:	J-42 or J-33/4,000-lb thrust
SPEED:	508 knots/sea level
RANGE:	945 nautical miles/310 knots
ARMAMENT:	(4) 20 mm. cannon

FH-1 PHANTOM-

TWIN-JET LOW-WING CARRIER BASED FIGHTER

The Phantom is a twin-jet, low-wing, Navy fighter plane. The jet engines are mounted in the wing roots forming very massive wing root sections. The wings are set well back on a thin fuselage causing the aircraft to appear extremely long nosed. The dihedral stabilizer is set high to avoid the jet blast and the cockpit canopy is forward of the wing affording excellent visibility. In the plan view, the leading edge of the wing is straight, with intakes forward of the wing breaking the straight line, and the trailing edge is tapered. All airfoil extremities are squared. The FH-1 was the Navy's first all-jet plane to operate from a carrier.

MANUFACTURER:	McDonnell
DIMENSIONS:	Span - 42' 0" (15'3" folded) Length - 37' 2"
ENGINE:	J-30/1600-lb thrust
SPEED:	400 knots/25,000 ft.
RANGE:	600 knots
ARMAMENT:	(4) .50 cal. guns



FJ-1 FURY-

SINGLE-JET LOW-WING CARRIER BASED FIGHTER

The Fury is a single-engine, single-seat low-wing monoplane with short stubby, thin, high speed laminar flow wings and resembles a high "flying bomb". The air intake is located in the nose while the engine and fuel tanks are enclosed within the fuselage. The Fury has a high square fin and rudder, the horizontal stabilizer has dihedral and is mounted high for increased stability. For all-around visibility, the cockpit has been located forward of the leading edge of the wing. The FJ-1 with its enormous fuselage dwarfs little jets, such as the FH-1.

MANUFACTURER:	North American
DIMENSIONS:	Span - 41' 0" Length - 33' 8"
ENGINE:	J-35/3820-lb thrust
SPEED:	471 knots/sea level
RANGE:	1190 nautical miles/278 knots
ARMAMENT:	(6) .50 cal. guns

F7F-3 TIGERC

TWIN-ENGINE MID-WING CA BASED DAY FIGHTER

The F7F Tigercat is a mid-wing monoplane with singl rudder, high mid-mount wing with straight lea sharply tapered trailing edge and squared off tip underslung, nacelles project beyond the trailing e wing. The fuselage is long and narrow with a t cockpit. The long horizontal stabilizer has slight leading edge and raked tips. This is Grumman's firs engine fighter design since the experimental F5F appeared in 1940. The F7F was developed for use rier decks but is now used primarily as a land ba fighter by the Navy and Marines.

MANUFACTURER:	Grumman
DIMENSIONS:	Span - 51'6" Length - 45' 4 1/2"
ENGINE:	R-2800/2400 hp
SPEED:	370 knots/19,200 ft.
RANGE:	1,360 nautical miles/155 knots
ARMAMENT:	(4) .50 cal. guns; (4) 20 mm. cannon

F-2 BEARCAT-

E-ENGINE MID-WING RRIER BASED FIGHTER

m of the Grumman fighter has produced this high maneuverable little fighter, which was with just prior to VJ-day, but too late for actual wered with the same horsepower engine as its the Hellcat, the Bearcat is lighter, smaller leaner in design. Along with the Corsair it is first line conventional engine carrier based Recognition characteristics are the familiar by fuselage, high bubble canopy and tapered low ing with blunt tips. The F8F-2 shown here is same as the F8F-1 with the exception of two 20

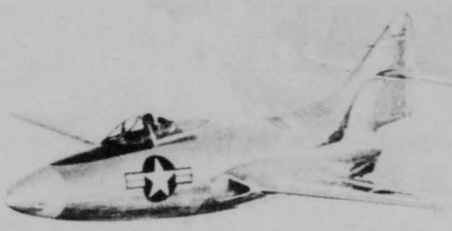
: Grumman
Span - 35'6" Length - 27'6"
R-2800/2380 h.p.
370 knots/19,900 ft.
1,140 nautical miles/140 knots
(4) .50 cal. guns or (4) 20 mm. cannon

F9F-2 PANTHER-

SINGLE-JET MID-WING CARRIER BASED FIGHTER

The Panther is the first jet plane produced by Grumman and has very few of the familiar Grumman recognition characteristics. The pressurized cockpit is located far forward on the thick fuselage. The intakes for the single centrifugal flow type jet engine, located in the fuselage aft of the pilot, are in the leading edge of the wing roots. The exhaust is out of the ventral side of the fuselage forward of the rudder extremity. A "droop snoot" wing is incorporated to improve landing and take-off characteristics. A removable nose section permits rapid changes of armament, electronic or camera equipment to suit the type of mission. Production version includes a pilot ejection mechanism.

MANUFACTURER: Grumman
DIMENSIONS: Span - 35' 3" Length - 37' 8"
ENGINE: J-42 or J-33/4000-lb thrust
SPEED: 508 knots/sea level
RANGE: 945 nautical miles/310 knots
ARMAMENT: (4) 20 mm. cannon



F3D-1 SKYKNIGHT-

TWIN-JET MID-WING CARRIER BASED LONG RANGE FIGHTER

The Skyknight, a versatile, two-seat, twin jet aircraft, first flew in August 1948. It has an all-metal mid-wing of semi-monocoque construction and a nose wheel landing gear. Pilot and crewman are seated side-by-side in a pressurized cockpit which is provided with air-cooling and heating systems, a flat armored windscreen, armored canopy roof and bulged sides. For emergency escape at high speeds a bail-out chute opening underside of the fuselage permits safe exit. Hydraulically operated speed brakes or flaps extend outward from the fuselage just forward of the tail. These brakes permit quick deceleration for carrier landings, maneuverability in combat and limit speed in dives.

MANUFACTURER: Douglas
DIMENSIONS: Span - 50' 0" Length - 45' 5"
ENGINE: Two Westinghouse J-34-WE-38 axial flow jets 3500 lb. thrust each at take-off, mounted semi-externally on either side of the lower fuselage.
SPEED: Over 475 knots
ARMAMENT: 20 mm. cannon
ARMAMENT: 20 mm. cannon

J-1 FURY-

-JET LOW-WING CARRIER BASED FIGHTER

a single-engine, single-seat low-wing monoplane stubby, thin, high speed laminar flow wings and high "flying bomb". The air intake is located while the engine and fuel tanks are enclosed uselage. The Fury has a high square fin and rizontal stabilizer has dihedral and is mounted eased stability. For all-around visibility, has been located forward of the leading edge of he FJ-1 with its enormous fuselage dwarfs little the FH-1.

: North American
Span - 41' 0" Length - 33' 8"
J-35/3820-lb thrust
471 knots/sea level
1190 nautical miles/278 knots
(6) .50 cal. guns

F7F-3 TIGERCAT-

TWIN-ENGINE MID-WING CARRIER BASED DAY FIGHTER

The F7F Tigercat is a mid-wing monoplane with single fin and rudder, high mid-mount wing with straight leading edge, sharply tapered trailing edge and squared off tips. Large underslung nacelles project beyond the trailing edge of the wing. The fuselage is long and narrow with a two-section cockpit. The long horizontal stabilizer has slightly tapered leading edge and raked tips. This is Grumman's first twin-engine fighter design since the experimental F5F Skyrocket appeared in 1940. The F7F was developed for use from carrier decks but is now used primarily as a land based night fighter by the Navy and Marines.

MANUFACTURER: Grumman
DIMENSIONS: Span - 51'6" Length - 45' 4 1/2"
ENGINE: R-2800/2300 hp
SPEED: 370 knots/19,200 ft.
RANGE: 1,380 nautical miles/155 knots
ARMAMENT: (4) .50 cal. guns; (4) 20 mm. cannon

AIR DEFENSE GRID

BY SUBDIVIDING ALL THE EARTH'S SURFACE TO LATITUDE 80° NORTH AND SOUTH INTO GRIDS, ACCURATE POSITIONAL DATA CAN BE EASILY OBTAINED AND TRANSMITTED.

Basic Grid for Air Defense Operations. Pending revision of FM 30-20, May 27, 1940, the following is published for the information and guidance of all concerned:

1. The purpose of the AD Grid is to satisfy the requirements of air defense in world wide application and to permit easy transmission of accurate positional information.

2. The AD Grid divides and subdivides all of the earth's surface to latitude 80° north and south in such a way as to keep the grid divisions and subdivisions approximately square. This is accomplished by changing the size of the grids in degrees and minutes of longitude several times between the equator and the poles. The only large variations in shape occur between latitude 72° and 80° N and S where the top of the grid lines converge considerably toward the poles, but it was felt that due to limited operation in this area it would be less confusing to allow the grids to converge more, rather than to add another change in grid size. Figure 6 illustrates the converging meridians and successive changes in grid lengths.

3. This grid system is based entirely on lines of longitude and latitude and can be placed on any map having longitude and latitude, regardless of type of projection, as can be seen in Figures 1 to 5 where several types are illustrated.

4. The first four successive subdivisions of the grid squares are identified by letters starting from the upper left corner of each grid square and running from left to right consecutively, omitting the letter I, as shown in Figures 1 to 4, inclusive, and are divided on the basis of degrees and minutes of latitude and longitude. Points in the fifth subdivision are identified by four coordinate numbers, the first two along the x axis (longitude) and the last two on the y axis (latitude). The first digit of the x and y axis are shown on the grid and the second digit of each is estimated.

5. The first division of the earth's surface is shown in Figure 1 in large shaded block letters:

A - from latitude 60° N to 80° N, longitude 0° around the world to 0°
B - from latitude 40° N to 60° N, longitude 0° around the world to 0°
C - from latitude 40° N to 40° S, longitude 0° to 120° E
D - from latitude 40° N to 40° S, longitude to 120° E to 120° W.
E - from latitude 40° N to 40° S, longitude 120° W to 0°
F - from latitude 40° S to 60° S, longitude 0° around the world to 0°
G - from latitude 60° S to 80° S, longitude 0° around the world to 0°

RESTRICTED

1620

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

6. The second division shown in Figure 1 and 2 with solid block letters is a division of each of the above shaded letter division as follows:

Shaded letter A grid area is subdivided into one row of eight grid squares, lettered from A to H inclusive. Shaded letter B grid area is subdivided into one row of twelve grid squares lettered from A to M inclusive. Shaded letter C grid area is subdivided into twenty-four grid squares, four rows with six grid squares each, lettered from A to Y inclusive. Shaded letter D and E grid areas are subdivided the same as shaded letter C. Shaded letters F and G grid areas are subdivided the same as shaded letters B and A, respectively.

7. The third division, Figure 3, is made by subdividing each one of the solid block letter grid squares, made in divisions two, into twenty-five grid squares. There are five rows with five grid squares each, lettered with hollow block letters from A to Z.

8. The fourth division known as basic grid, Figure 4, is accomplished by subdividing each one of the hollow block lettered grid squares in division three into twenty-five basic grid squares, five rows with five grid squares in each and lettered from A to Z inclusive. The length of sides of the basic grid squares in degrees and statute miles are shown in Appendix.

9. The fifth division, Figure 5, is made by subdividing each one of the basic grid squares in division four into one hundred grid squares, ten rows with ten grid squares in each, and numbering the x and y axis. The division can be made by simply stepping off ten equal parts on all four sides of the grid and drawing in the lines parallel to longitude and latitude lines.

10. To make a position report the four letters of each of the four divisions, and the four numbers of the fifth division are used. The full designation of point X, figure 5, is EBPW5518. For local operation some of the larger division letters may be omitted.

11. To lay out a grid for local operation anywhere between latitude 40° N and S refer to Fig. 1 division two (solid block letters) to determine in which grid square the area to be gridded lies. This grid area, 20° on a side, is then laid out with pencil on a map. Next divide this square into twenty-five grid squares 4° on a side and letter the subdivisions as illustrated by hollow letters in Fig. 3. Only one or two of the division 3 (hollow letter) grid squares are normally used for local operation but the above procedure is necessary to establish the location of the letters. The division three grid square to be used is then divided into 25 basic grid squares, 48' on a side. Each of these is then further subdivided into 100 grid squares as shown in Fig. 5.

The procedure for laying out a grid in the area between latitude 40° and 60° N or S is identical except that the second division grid area lengths are 30° longitude by 20° latitude. This makes the third division grid areas 6° longitude by 4° latitude, and the fourth division grid areas 72' longitude by 48' latitude.

1621

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Likewise the procedure is identical for laying out a grid in the area between latitude 60° and 80° N or S except that the second division grid area lengths are 45° longitude by 20° latitude. This makes the third division grid area 9° longitude by 4° latitude, and the fourth division 108' longitude by 48' latitude.

1. The following table shows in angular measure the length of the sides of division 3, and basic grids division 4 in different areas of the world:

Division One (Shaded letters)	Latitude	Division 3 Fig. 3		Division 4 Basic Grid	
		Long.	Lat.	Long.	Lat.
A & G	60° - 80° N&S	9°	4°	108'	48'
B & F	40° -60° N&S	6°	4°	72'	48'
C,D & E	40°N -40° S	4°	4°	48'	48'

2. The following table shows length of Basic Grid (Fig. 4) base lines in statute miles:

Latitude Degrees N & S	Miles for 48' Lat.	Miles for 48' Long.	Miles for 72' Long.	Miles for 108' Long.
0	54.963	55.338 (Equator)		
4	54.966	55.204		
8	54.974	54.803		
12	54.987	54.136		
16	55.006	53.208		
20	55.029	52.021		
24	55.056	50.582		
28	55.086	48.898		
32	55.121	46.973		
36	55.157	44.822		
40	55.194	42.450	63.676	
44	55.234		59.808	
48	55.273		55.646	
52	55.311		51.211	
56	55.349		45.525	
60	55.384		41.609	62.413
64	55.417			54.731
68	55.446			46.778
72	55.472			38.594
76	55.493			30.218
80	55.509			21.692

For example, the size of a Basic Grid Square at latitude 28° N or S is 55.086 by 48.898 miles. A basic Grid Square at latitude 48°N or S is 55.273 by 55.646 miles. A Basic Grid Square at latitude 64° N or S is 55.417 by 54. 731 miles.

POLAR GUIDE

This is the Seventh in a Series of Chapters on Arctic Indoctrination

Chapter XVIII - Land Survival

FORCED LANDING

Stay on your pre-arranged flight course at all times, so that if you are forced down the rescue party will be able to find you. Keep in touch with the nearest air base; if you find yourself in trouble, you can radio your position before landing. In mid-winter, ice on quiet polar waters attains a thickness of three to six feet. Frozen lakes are therefore the most suitable landing places, although broad rivers, treeless valley floors, beaches, and even ice floes may have to serve. In the early fall, lake landings are inadvisable; and in the spring, beware of rough, discolored, rotten-looking ice. If you are obliged to land on a glacier, ice cap, or on the snow-covered tundra, come down parallel with, rather than at right angles to, the "sastrugi" (wind-formed ridges of snow). If crevasses are visible on your landing area, take them at right angles.

Unless you know the terrain perfectly and have been there a very short time previously, don't make a wheels down emergency landing regardless of how smooth the surface looks. With wheels down, hummocks or piled snow will probably cause you to nose over.

Don't bail out unless the plane is afire and in danger of disintegrating. Even in a fighter, your chances for continued life are far greater in almost any kind of forced landing than in a bail-out at very low temperatures with only the small amount of survival equipment you can carry on your back.

In the first place, bailing out is a dangerous procedure in most polar areas. You are likely to be dragged by the wind, your clothes torn, and your body frozen before you can get loose from the parachute. And it can happen even to experts. In fact, it did. In a recent rescue, a man familiar with cold weather techniques, with plenty of parachuting experience, dropped under favorable conditions, was dragged several miles by the wind and was found frozen to death, still in his parachute harness but with his clothes ripped wide open.

Furthermore, your chances of survival and of being found are far, far greater if you stay with your plane. A recent B-29 accident is a case in point. The plane had crashed into a hillside that looked like a cloud, and a good part of the plane had been destroyed. None were seriously injured, however, and the pilot (who should have known better, for he was a veteran of two previous crashes) and the navigator took most of the remaining survival equipment and tried to walk out. The rest of the crew stayed with the airplane and though they had practically no equipment or food managed to survive for five days when they were found and rescued. The pilot and navigator were found shortly afterward, frozen to death, a few miles from the plane.

1629

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

By crash landing you will have the advantage of a radio, extra emergency kits, and the plane itself, which will furnish material for both shelter and improvised equipment. When you crash-land, get out of the plane as quickly as possible; take your chutes and emergency equipment along if you can do so in a hurry. Simple tools, such as screw drivers, pliers, and hammers can also save you much unnecessary discomfort. Stay away from the plane until engines have cooled, free gas has evaporated, and the danger of fire is past. If you are in a pursuit or a light bomber, keep your chute on as you get out. In large aircraft throw out a few chutes, but don't allow this action to slow up the exit.

BAILING OUT

Don't bail out unless it's absolutely necessary. If you have to bail out, do these things:

1. Wear the heaviest clothing possible - you'll need all of it. The outdoor air may be so cold that you will freeze parts of your face or hands during descent. Wear gloves and protect your face with your hands if you can. Your rate of descent may produce a freezing effect sufficient to cause frostbite.

2. As you come down, keep your eye on the plane and try to fix the position of the crash so you can get to it after you land. Even if the plane burns after the crash, the wreckage will still furnish some valuable aids for camping and traveling. Also make a search within a radius of a hundred yards of the crash for things that were thrown out of the plane as it crashed.

3. Don't abandon your parachute after it has brought you down. Every part of it will make useful emergency equipment. In the packet of each parachute pack is a small booklet on "Emergency Uses of the Parachute", AF Manual 64-0-4.

PLANNING

Survival procedures naturally vary with the size of the crew. In an emergency landing a large crew is at an advantage, for there can be division of labor according to the skills of the individual members of the crew and, as a result of this teamwork, greater safety and comfort can be achieved. For maximum efficiency, therefore, crews must be carefully trained so that, while all members of the crew are familiar with the overall survival procedures, each member is particularly prepared for one or more special jobs. Of course, there is always a possibility of casualties, and there may have to be substitution of duties. The airplane commander must therefore be familiar with the special skills of each crew member and be ready in case of a crash to assign primary responsibilities for major functions to particular individuals or groups of individuals. In this way all the work involved in survival can be accomplished without neglect of any job because of casualties.

Small crews and fighter pilots must also have a fairly accurate conception of the jobs that must be done in order to survive after a crash landing or bail-out. Regardless of the amount of planning and briefing before the flight, each survival situation has its own peculiarities, and procedures must be planned carefully in order to take best advantage of all favorable factors. Consequently, after giving first aid and doing what you can to keep temporarily warm and dry, plan carefully the survival measures to

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

be taken. Taking into consideration the equipment and supplies available, plan steps necessary for transmitting distress signals, securing shelter, and supplementing your rations.

FIRST AID

Check for injuries at once and treat them immediately. Keep all injured personnel warm and lying down. Wounded persons require special care because they are more likely to freeze than uninjured men. They must be made warm at once with coats, parkas, chemical thermo pads-whatever is available - even while essential first aid is in progress. When a sleeping bag is used, brush the snow from the injured person's clothing before putting him into it. Watch especially for shock; if not treated at once, it may result in quick death. Shock symptoms are: Pale face and lips, clammy skin, nausea, weak pulse, rapid breathing, and mental confusion. Treat a victim of shock by laying him on his back with his head low and his feet raised. If you have no sleeping bag, lay him on seat cushions or floor mats retrieved from the plane. Keep the patient warm, wrapping him in extra clothing or a parachute. If he is conscious, and no internal injuries are indicated, give him warm, sweet drinks, but avoid alcohol. When stopping bleeding, release pressure frequently or the casualty will freeze. If a tourniquet must be applied, warm those parts of the body where the circulation is cut off. As soon as bleeding is checked, remove the victim to a warm spot.

Remove boots from injured persons who can't walk and wrap their feet in any covers available. Check the condition of the feet at least twice daily. If feet remain cold for long periods, trench foot or freezing may set in. One such injured man lost both feet because no one bothered to remove his boots during a rescue period of nine days. Remember that the cold pain sensation may be gone entirely when trench foot or freezing sets in.

Treat other injuries as follows:

Cessation of breathing. Apply artificial respiration with the victim's tongue pulled forward. Check for a fractured skull (indicated by enlarged pupils, bleeding from ear or into skin around eye); keep the victim warm and dry.

Fractures. Improvise splints and pad with soft materials; don't remove clothing from fractured limbs, but if a wound exists, cut away the clothing around the wound and dress the wound before applying splints.

UTLIZING THE AIRPLANE

In all your plans, remember that the plane will provide you with much needed shelter and equipment and will make it easier for the searchers to find you. Don't abandon your plane.

When you are sure that there is no danger of fire, return to the airplane and drain all the oil from the engine. You can do this best by using the "Y" drain of each engine. Don't worry about containers; at low temperatures the oil will congeal rapidly when draining directly on the ice and snow and in this congealed form can be used at any time for several purposes. However, if you wait long before attempting to drain, the oil will congeal in the engine and you will have to expend a great deal of effort to get even a small amount of oil from the engine. Don't drain the gasoline. Since it will not congeal, the tanks offer the best storage spot for it. You

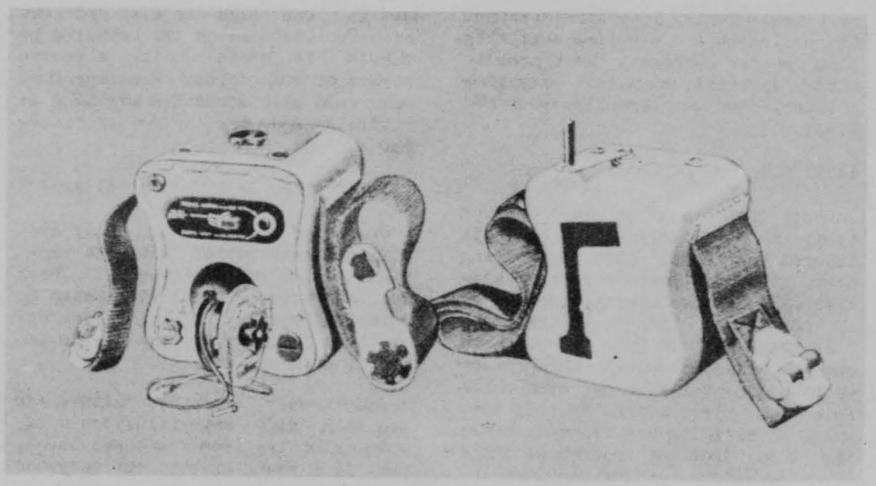
1631

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED



can get the gasoline from the tanks as you need it.

Moor your plane securely so that it will remain in place even if there is a gale.

SIGNAL DEVICES AND SIGNALS

If the radio transmitter in your plane is operative, get your radio signals going as soon as possible after giving first aid and taking care of other immediate necessities.

RADIO SIGNALS

Radio is your quickest and most effective means of securing help. Try to establish radio contact as soon as you can safely return to the plane, and keep on trying. On bombers or cargo planes, use the auxiliary power unit if possible.

Try to start the auxiliary power unit by means of its associated battery. If warming is necessary, remove the oil drip pan from under the APU, insert into the pan wicks of harness soaked in gasoline, and ignite them. Keep all available fire extinguishers near for immediate use if necessary. If the APU battery is low, re-charge it on the first running, then cut off the APU.

Since it will obviously be impossible to run the APU continuously, you'll have to determine how often you should start it and how long you should run it. Base this decision on the fuel and oil reserves, the condition of the battery, and the temperature. The interval between periods of running must never be so great that the APU cools below its minimum starting temperature. In general, at an average temperature of -30° F, the unit must be run approximately every one-half hour in order to keep it warm enough to start at will. If you cover the APU with some insulating material, such as a blanket, you can increase the interval between running periods.

If the APU is damaged or if there

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

is none on the plane, use the plane's battery. (In some instances, pilots forced down on ice have used the plane's engine for power purposes by chopping a trough so that the propeller might rotate freely.)

If the regular radio equipment is operative, transmit on the control frequency. Give your identification, assumed position, weather, nature of injuries, and any other information that might aid a rescue party. Transmit during the 3-minute International Silent Period which begins at 15 and 45 minutes after each hour.

If the radio equipment is inoperative or if the battery is down, try to attract attention with an emergency transmitter - the Gibson Girl (AN/CRT-3) or the lightweight Hand Energized Radio Beacon Transmitter (AN/CRN-16) which is being developed and will probably be ready for distribution before long.

AN/CRT-3. Set up the Gibson Girl transmitter in a broad valley near a river if possible. Avoid very narrow valleys surrounded by high mountains. If the terrain does not afford a reasonably broad valley, try to gain access to a summit. The best coverage is secured by using all 300 feet of antenna wire supported by the balloon or box kite. When there is less than a seven-mile wind and you can get water for the balloon's hydrogen generator, use the balloon to raise the antenna. You will need four to five gallons of water for the hydrogen generator, and, if water is not at hand (as in an unfrozen stream or lake), you'll have to melt ice or snow to get it. On the polar pack, it may be easier to go to the nearest lead or dig through the floe. To inflate the balloon, follow the directions given on the can in which the balloon is packed.

Using AN CRT-3.

When the wind is strong, use the kite to raise the antenna. Attach the antenna to the proper tab on the kite. This will keep the kite from jerking violently and perhaps snapping the antenna wire. If you can't use the kite or the balloon, make the antenna as long as possible. Attach the far end of the antenna to a high tree or, if none is available, to the highest point of the crashed plane. To provide a satisfactory means of throwing the antenna to the top of a tall tree, tie the ground wire cap to the end of the antenna wire. Make the antenna fairly taut. Be careful to insulate the end of the antenna from the point of attachment to the airplane structure or tree. Attaching a length of rope, cord, or parachute shroud line is sufficient to maintain clearance of the antenna wire from the grounded objects and accomplish the required insulation.

To get a good ground connection, immerse the ground wire in an open stream or through ice into a body of water. If it is not possible to obtain a good ground, use a counterpoise. Lay out the spare roll of antenna wire in a straight line on

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

the ground and connect it to the ground wire on the transmitter.

If you can't find a high point on which to attach the antenna, lay out the full length of antenna wire on top of the deepest snow or ice bank you can find. For a counterpoise, stretch out the spare roll of antenna wire in the opposite direction from the antenna and connect it to the ground connection at the transmitter.

When you have completed setting up the antenna and ground (or counterpoise), transmit in accordance with the instructions printed on the transmitter. Turn the selector switch to 500KC/8280 KC AUTOMATIC. This sends an SOS when the crank is rotated. Between sunrise and sunset (or at corresponding times in winter) operate from 15 to 30 minutes after each hour. This will include one of the international distress listening periods. If you can't stand fifteen minutes of cranking, transmit for five minutes, from 15 to 20 minutes after each hour. Be sure to crank a few minutes each daylight hour to make sure the signal reaches distant RDF stations. It will probably take the entire daylight period for the RDF stations to obtain a fix. You can expect search planes on the second day of operation. When you hear or sight them turn the switch to 500 KC MANUAL. Hold down the key and crank continuously. If visibility is poor when the planes fly overhead, turn the selector switch to SIGNAL LIGHT POSITION and crank. At the same time blink the light with the key.

AN/CRN-16. Development of a hand-energized radio beacon transmitter is now reaching the final stage, and a limited number of these transmitters will soon be available for distribution. The transmitter, which weighs a total of only 2 1/4 pounds, includes a hand-cranked generator and can be carried in a pocket of the flying clothes. The transmitter operates at a very high frequency and can be received over line-of-sight distances. It will be particularly useful for fighter pilots.

VISUAL SIGNALS

In wooded country, light a fire at once; it is not only a good signal, but a source of warmth as well. At night it shows up best when inside a paratepee. Don't keep it up all night, though, unless someone can stay up and make sure it stays under control.

To attract the attention of a search airplane after you hear or see one, prepare the materials for a number of flash fires. Use fine slivers of wood from the airplane floor, raveled parachutes and harness, small chunks of rubber from seats and padding, and any other materials that will burn easily. Lay them on some suitable surface (such as a cowl section), which will keep the materials out of the water resulting from the heat of the fire. Include a can of gasoline and water-resistant matches in the cache so that, when necessary, you will be able to start the fire without delay. Cover these materials with a piece of parachute canopy or similar cover to protect them from drifting snow.

In winter these fires may not be visible from a distance from the air, especially against the snow background. A column of black smoke, however, is a good signal anytime of the year. Therefore, prepare such materials as chunks of congealed oil, animal fat, innertubes, rubber hose, floor mats, de-icer boots, damp leaf mold, green leaves, or rotted wood, to throw on the fire after it is

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

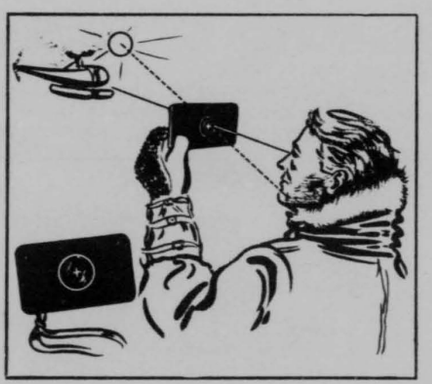
THIS PAGE IS UNCLASSIFIED

burning strong.

In timber country, both summer and winter, every green spruce tree of good height from about ten feet up is a potential day or night signal of excellent visibility. Gather the dry dead twigs from other trees and shake them free of snow and frost. Then, after you have shaken the tree free of snow, build a big "bird's nest" of them in the lowest branches of the tree you have selected for the signal. When you light the "bird's nest", the tree will go up like a Roman candle. Gasoline thrown on the "nest" or oil-soaked rags placed in it make for really quick starting. You cannot make a better signal day or night. The smoke and flame are visible for miles. If you are lucky enough to be in timbered terrain, don't confine yourself to one tree. Prepare a number of trees, as high as you can on ridges and hilltops, and ignite them whenever you hear or see a rescue plane in the vicinity.

A signal mirror is an extremely effective visual signal. Rescue planes have been brought in by it from distances as great as twenty miles. Keep a signal mirror handy on your person so you can use it the minute you spot a plane. Practice signaling with it. If you have no mirror, improvise one from a ration tin by punching a hole in the center of the lid.

If there is snow, tramp out a big SOS, making the letters about 200 feet high and outlining them with evergreen boughs. A circle stamped out on the snow, laid out with twigs or shown clearly in any other way, is also a clear signal of distress. In open snow country, long straight tracks can be seen from the air for several miles. Take hikes off in various directions, dragging an object that will make good tracks. Keep your plane free of snow so that it will contrast with the snow around it.



Signal Mirror.

Put yellow or orange ponchos or orange-colored life-preserver cushions on the wings. Lay out shiny metal portions, such as engine cowlings, so they will reflect light; arrange several such panels in different positions to create a series of reflected rays with wide coverage. Another good visual signalling device will be your parachute. All new parachutes will be colored international orange, a color which has been decided upon as among the most conspicuous in any kind of terrain. Your Barren Land Tent, if you have one, will also serve as a good visual signal, since it has a fluorescent neon-red color.

In open country spread your signal panel on the ground, folded properly to give your message. Anchor it with a few stones or small logs. In timbered country, fly it from a long pole lashed to the top of the tallest tree. If you have no panel, make signal flags from chute cloth.

1635

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

You can also raise the Gibson Girl balloon or kite antenna above the trees as a signal. On snow or on open water leads within the sea ice, sea marker from your life raft is an effective visual signal; keep it from freezing so that you can use it when you see a plane.

At night or during periods of poor visibility, use colored flares when you hear an airplane. Keep your flares and smoke bombs handy for instant use; don't waste them. Signal with a flashlight or the blinker signaling light of the emergency radio. If the airplane's landing lights are intact and you can get an engine to run, remove the lights and extend them for signaling. But don't waste the battery; save it for the radio.

RADAR DEVICES

Corner reflectors MX-137A and MX-138A (Emily) can help greatly in attracting radar-equipped planes to your position. They reflect a large portion of the radar energy that strikes them and make radar detection much more likely. In using a corner reflector, remember that it is a line-of-sight device - that is, objects in the way, such as heavy woods or mountains, prevent signals from getting out. Place your corner reflector as much in the clear and as high as conditions permit. On a smooth, unbroken expanse of ice several miles in area, corner reflectors have a range of two to twelve miles. They require no power and are continuously usable. Just make sure that the reflecting surfaces are always taut and at exact right angles. If the reflector is damaged, try to restore it to its original shape and its original position on the mast.

POSITION DETERMINATION

To speed rescue, it is essential that as accurate a position indication as possible be transmitted. You must therefore take precautions to protect navigation instruments, particularly octants and watches, from damage at time of the landing and must remove them, together with map kits, solution tables, etc., from the airplane as soon as possible after landing.

Make observations immediately and from time to time to determine with as high degree of accuracy as possible the position report to transmit over the radio. If, because of loss or damage, no octant is available, improvise some method of measuring altitudes. Use the astrocompass, a Weems Plotter with a plumb line attached at the center of the protractor, or measure the length of a shadow cast by a vertical rod of known height. Crude instruments will give divergent results, but if you average the various positions obtained or send them all, you can help search parties cut down the search area and thereby increase the chances of a successful search.

SANITATION

To prevent pollution of the living area and of snow and ice which you might use later for drinking water, select a special site for a latrine as soon as possible after landing and establish a sheltered latrine. Adhere strictly to latrine discipline, for you can never be certain that you will not have to occupy your camp for a considerable time even after its position is known on the outside.

In order to avoid interrupting sleep and having to crawl out of the sack, drink most of your liquids immediately after arising. Don't drink before going to sleep. Besides making for greater comfort, this prac-

1636

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

tice will reduce tendencies toward violation of latrine discipline.

In case the necessity arises while you are on a hunting trip or away from camp for any other reason, don't be afraid of performing latrine duties regardless of the temperature. You have sufficient body heat to prevent the freezing of the necessary exposed parts during the short period involved. Of course, you should take advantage of any shelter from the wind to reduce possible discomfort.

Early in your setting up a camp, select a dump area in an inconspicuous place nearby and dump all refuse there. A littered camp area is not conducive to sanitation or morale.

CLOTHING

No matter what you do, you will have to keep warm and dry. If snow got into your boots when you left the plane, shake it out and close the opening it slipped through. If your socks are wet, change them. If you have no spares, several layers of parachute cloth wrapped around your feet are better than wet socks. One pilot who was forced down on the Alaskan Route didn't dry his feet after snow got into his shoes during a walk - and he lost several toes from freezing. Had he simply taken off his shoes and socks, shaken the snow off them, and then dried his feet and wrapped them with parachute cloth, he might still be flying today. If your boots are big enough, a few handfuls of dry grass stuffed around your feet will make a warm "sock" that is hard to beat - Laplanders have used grass "socks" for centuries. Padding from seat cushions will serve equally well. Don't stuff the materialin tightly, though. Leave some room so that there will be adequate circulation.

Keep your hands warm. A lost mitten can mean a lost hand or even a lost life, so tie your mittens together with a long string that runs up behind your neck. A short string connecting the lines across your chest will help keep the strings out of your way. Try to do everything with your mittens on. If you are forced to remove them, stop and warm your hands frequently - more often than seems necessary, because once they get stiff you are in trouble. If your hands get too cold, put them in a pocket or inside your clothing to warm up. But don't wait until your fingers are so numb you can't unbutton your clothing. If you drive yourself too hard at heavy work, you will become exhausted and also perspire a lot. Both perspiration and exhaustion increase the chances of freezing. Therefore, take it easy; don't wear too much clothing while you are exerting yourself. To cut down perspiration, open your clothing at the neck and wrists and loosen it at the waist. If you wear a parka and get hot, let it hang loosely at the waist. If you are still warm, take off an underlayer or two. Don't open your trousers or your boots - it's a sure way to get snow in them. The minute you stop work, put on more clothing to keep from getting chilled. Try wrapping a piece of parachute around you, Indian-fasion; it helps cut off the wind.

In summer, protect yourself from insects with a headnet, gloves, and other means.

Polar Guide Chapter XVIII Rest

* * *

War is the aftermath of the failure of diplomacy, but it is the continuation of policy and its object is to enforce that policy as economically as possible.

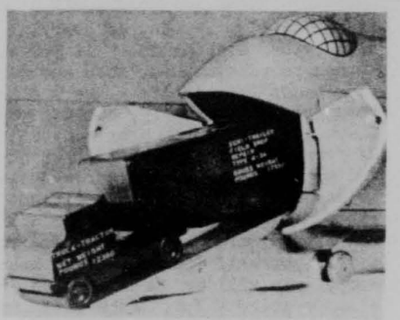
IMPROVED CARGO VERSION OF B-36 BOMBER PROPOSED; WOULD FEATURE EASIER LOADING, MORE CARGO SPACE



Procurement Division officials at Air Materiel Command Headquarters are studying a design proposal for a production model of the experimental XC-99 transport. The proposal was recently submitted by Consolidated Vultee Aircraft Corp., builder of the giant cargo version of the B-36. Company officials say the proposed transport, to be known as the C-99, could haul bigger loads (both in size and weight) over longer ranges than any other aircraft either in existence or in prospect.

It would differ from the XC-99, which was delivered to the Air Force last year, in five major ways: (1) higher-horsepower engines;(2) easier loading through nose and tail doors; (3) a 57% increase in usable cargo space; (4) a pressurized crew compartment and upper deck; and (5) a B-36-type flight deck, including a bubble canopy.

The C-99 would become the latest transport version of the B-36 and about 70% of the parts of both planes would be interchangeable. Like the "Flying Cigar", the C-99 would be equipped with six pusher-type engines and four-wheel main landing gears. It would have the same wing as the B-36 bombers, with a span of 230 ft., but its double-decked fuselage would be longer and much larger. The experimental XC-99 last April carried 100,000 lb of simulated cargo on a test flight - said to be the heaviest load ever taken aloft in one airplane.

Installation of the more powerful engines would enable the proposed transport to take off at a much higher gross weight than is possible with the experimental model. Because of this increase in gross weight and the improved fuel-consumption characteristics of the proposed engines, the C-99 could carry a 100,000-lb payload nearly 2,000 nautical miles further than the XC-99 can carry the same load. With the 100,000-lb payload, the new Convair transport could take off from bases in the eastern part of the country and fly nonstop to Britain or western Europe. It could carry a maximum payload of 116,000 lb for a shorter distance.

Mobile equipment would be able to drive directly on or off the plane through a clamshell-like nose door or an elongated tail door by means of self-contained low-angle ramps. Electric hoists, operating on cargo compartment, would facilitate loading, shifting, and unloading of heavy equipment and cargo. When used as powered winches,these hoists could pull non-powered vehicles up

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

the ramps and into the plane.

The entire cargo compartment would fully open up at both ends to provide entrances nearly 12 x 13 ft. These doors would removethe restrictions imposed by hatch-size limitations and would permit more varied loading arrangements.

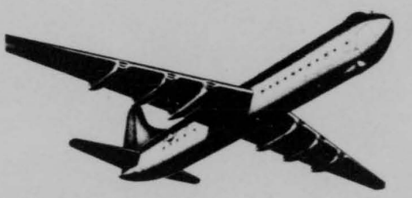
The proposed air freighter would have 21,715 cu ft of usable cargo space (volume projected above cargo floors) - an increase of 57% over the XC-99. This was accomplished by enlarging the fuselage and changing the size and shape of the compartments. The revised lower cargo compartments could accommodate a substantial number of armored vehicles and other military equipment which cannot now be delivered by air.

To provide greater comfort for crew members and passengers in the C-99's upper deck, cabin pressurization would be installed. While carrying a large cargo load in the lower compartments, the plane could still carry 183 troops in the upper deck under all-weather flight conditions. Convair officials report this pressurization feature is particularly significant in transporting litter patients.

To achieve closer standardization for flight crews, the B-36 flight-deck arrangement of pilot, copilot, and flight engineer would be installed in the C-99 beneath a bubble canopy.

The proposed transport could haul 401 fully equipped troops. As a quickly converted hospital plane, 343 litter patients and 33 medical attendants could be accomodated.

One or more of each of the following could be carried in the C-99: fueling units, towing tractors, air-



AN ARTIST'S DRAWING of the proposed C-99. Several major improvements, including higher-horsepower engines, pressurized compartments, and a B-36-type flight deck, are the main difference between this plane and the experimental transport which last year made a test flight carrying 100,000 lb of cargo. About 70% of the parts on the C-99 and the B-36 would be interchangeable.

plane spares (including complete nacelles, jet pods, and landing gears), heavy guns and carriages, light and medium tanks, trucks, jeeps, field shop-repair units, helicopters, liaison planes, guided missiles, and similar items. Moreover, after the maximum number of a given item had been loaded, the plane could still take a quantity of cargo or troops before attaining its normal 100,000-lb payload capacity.

Only 44 of these transports, Convair reports, would be needed to simultaneously move all the troops in an entire airborne division - now about 17,500 men.

Company executives, in proposing the plane, declared that the C-99 would be able to carry these large loads over long ranges, and the direct flying cost per ton-mile would be extremely small. In the same way, the plane's "rate of work" - as expressed in ton-miles per hr at various ranges -would far exceed that of any other aircraft, it was said.

It was pointed out that development costs of the new ship have been borne by the B-36 and the XC-99, and relatively small expenditures would be required for additional research and development. It would also require a minimum of engineering man-hours, and delivery of the planes could start in a comparatively short time.

PO-1W - NEW NAVY FLYING LAB

This specially modified Lockheed Constellation (one of two) is being used by the Navy to conduct extensive tests of airborne early-warning radar equipment and procedure. Ship-borne radar beams are limited to the optical horizon, because they do not bend with the curvature of the earth. With the high-altitude Constellation's radar beams reaching far beyond, valuable time is gained for launching interceptor fighters from ships or shore stations and for deployment of fleet units to meet aerial attacks. Designated by the Navy as the PO-1W, the Constellation can remain aloft for long periods on patrol missions from shore stations. Bunks are provided for relief of crew members. The flight characteristics of the modified Constellation are not materially affected by the bulky radomes visible on the top and bottom of the fuselage.

AIR INTELLIGENCE Review

This "Review" is published for three reasons:
1. To provide timely data regarding new techniques, practices and general information whereby intelligence personnel can maintain proficiency.
2. To provide material which will afford all personnel an appreciation of the intelligence role.
3. To provide a medium whereby all intelligence personnel and activities may exchange viewpoints, problems and solutions.

Two types of material are solicited for publication:
1. Stories and pictures relating to the intelligence activities being conducted within an organization.
2. Original articles of a nonoontrovessial but informative nature.

Material submitted must include sources utilized and the authors name, rank and present military affiliation. Mail stories to: The Editor, "Air Intelligence Review," ConAC, Mitchel Air Force Base, New York.

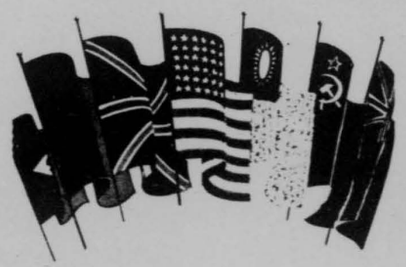
EO 11652

COMMUNIST TACTICS AT AN INTERNATIONAL CONGRESS OF INTELLECTUALS



The political and psychological strains of the postwar period have given impetus to the convocation of international congresses of private individuals for the avowed purpose of exploring ways and means by which the people of the world can coexist more amicably. A large sector of world public opinion, disappointed that the last war has not yet brought definite peace, views such congresses with a certain amount of hope and expectation that they will achieve concrete results related to their stated objectives.

This is particularly true in the case of gatherings of outstanding leaders in the realms of the arts and sciences. Ordinarily such persons can be expected to be aware of the actual problems involved in improving international relations and of the attempts already made to further international peace and security. Furthermore, such persons generally are considered to have a reasonably objective outlook, which should enable them to study problems and seek workable solutions without engaging in mere slander and abuse against any country or group.

Unfortunately, the first international gathering of intellectuals, which took place at Wroclaw (Breslau), Poland, in August 1948, did not accomplish anything constructive, much to the dismay of those well-intentioned individuals who attended it. Their hopes were blasted by the Communists, who arrived well prepared to harangue the Congress with the Soviet line regarding the culpability of the western democracies and the thwarted "peace efforts" of the Soviet Union. Because of the Communists' tactics, the meeting became a platform for Soviet propaganda rather than a conference for evolving objective proposals to improve relations between peoples.

The meeting, which was called the World Congress of Intellectuals in Defense of Peace, was in session between August 25 and 28, 1948. It was sponsored by a non-governmental committee of Polish intellectuals, generally oriented to the left, with the support of a similar group of French intellectuals.

The first public announcement of the projected congress appeared in May. Invitations were sent to over 500 intellectuals of all countries. Subsequently, it was announced that certain renowned intellectuals would attend, a fact which attracted many of the non-Communist participants who looked forward to the establishment of personal contacts and exchange of views with men prominent in public, artistic, and scientific life. A number of these outstanding

[redacted]

1647

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

figures, however, did not attend.

The objectives of the Congress were announced by Jeroslav Iwaskiewcz, chairman of the Polish sponsoring group, to be (1) exploring means of safeguarding principles of peace, (2) examining the problem of national cultures, (3) discussing the possibilities of international popularization of achievements in the realms of science and art, and (4) unifying the efforts of representatives of the cultural world with progressive social movements.

It quickly became obvious that the gathering was not a balanced representation of international intellectuals, though, since invitations had been extended almost exclusively to individuals who were accustomed to support or give tacit approval to the Soviet position on various questions. Moreover, while non-Communists outnumbered party members in the delegations attending the Congress, each group had a core of purposeful Communist leaders, together with a large number of fellow-travelers. (The Polish organizing committee arranged for the comfort of all delegates. Transportation costs of Western delegates, as well as hotel, food and sightseeing expenses were defrayed by the committee.)

The technique employed in the election of officers insured Communist control of the meetings. After the welcoming speeches, the proposed executive council of the Congress and the rules governing the Congress were hurriedly approved by acclamation upon the motion of Maurice Bedel, chairman of the French organizing committee. The name of Jerzy Borejsza, one of Poland's ten leading Communists, was placed before the Congress and accepted for the post of Secretary-General, who by the rules of the Congress dictated the choice and order of speakers.

The first speaker, A. Fadeyev, Chairman of the Soviet Writers' Union, launched an abusive attack against the United States, its culture, and its people. In a speech characterized by flagrant misstatements and slander, he charged the British Labor government, as well as American leaders, with following Goebbels' policies. Fadeyev asserted that all the prominent leaders of real democratic cultures who are drawing inspiration from the country of socialism should unite and lead an unrelenting, active, effective fight against those that Stalin brands as enemies of mankind.

Having castigated the Western nations, he then eulogized the USSR, its sympathizers, and its allies.

Fadeyev's wrangling stunned a considerable portion of the audience, particularly members of the American and British delegations, several of whom submitted requests for the floor and stated their intention to quit the congress. But Fadeyev's invocation of the Party line, his castigation of the United States, his eulogies of the "achievements and beneficence" of the Soviet Union remained the dominant theme of the remaining sessions of the Congress.

Possibly feeling that they had overdone the attack on the Westerners in the opening speech, the Russians sought to mollify the feelings of those offended by Fadeyev when, the following morning, Ilya Ehrenburg delivered a much less emotional and derogatory address. This speech was tempered by such statements as "Far be it from me to give vent to any kind of undue patriotism; I know that there is much good in America, remarkable scientists, writers, architects," or "the triumph of boor-

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

ish Thomases will never conceal from us the diligence, giftedness, and kindness of the American people". Nevertheless, he closely adhered to the Party line in regard to "American imperialism" and Soviet "love for peace".

This mollification was carried a step further when on the third day the Russians invited the Americans to a private lunch. However, the real intent of the Soviet representatives was made inescapably clear in the meeting the same afternoon. Tension reportedly continued to mount with the successive speeches, and Dr. Julian Huxley finally gained the floor to make a plea for the abandonment of recriminations. He expressed his distress at "the lack of mutual comprehension, even lack of mutual appreciation that has been shown here." He appealed to his colleagues of the Russian delegation that they recognize repressions and restrictions. Finally, Huxley expressed the hope that something constructive might be accomplished in the last hours of the Congress.

However, the Soviet participants obviously had no intention of seeking constructive, impartial results. David Zaslavski of the Soviet Union, obtaining the floor from Secretary-General Borejsza, responded to Huxley by denying that any restrictions exist within the USSR, and advised Huxley that he and his colleagues had come to talk, not about cultural matters, but about peace and war—and that they would do so.

Only a few dignified, constructive addresses were made during the congress. Most of the participants, following the lead of the Soviet representatives, railed against the United States and its "puppets" in other states. A notable exception was Allan J. Taylor of the UK, a former BBC commentator who had to resign his job because he was considered "too pro-Soviet". Condemning the intolerance and hatred evinced by Fadeyev, Taylor averred that ".....without intellectual freedom, without love, without tolerance, the intellectual cannot serve humanity."

Speaking in a similar vein, Dr. Bryan J. Hovde of the American group objectively admitted certain shortcomings of the United States, but pointed out the progress made in overcoming them. He then recounted many of the defects prevailing in the Soviet Union, which the Soviet representatives, whom he charged with warmongering, refused to acknowledge. In conclusion, he called for cooperation in effecting an eight-point constructive program for peace.

Apparently, the organizers of the Congress had prepared a resolution for presentation to the Congress and hoped that it would be passed by acclamation. However, this information leaked out, and several irate Western participants induced the organizers to draft a resolution in committee.

An international drafting committee selected by the executive committee and dominated by Secretary-General Borejsza, thereupon worked out a resolution to be placed before the Congress. A draft, originally prepared by Huxley and approved by Hovde, which emphasized the importance of the UN and UNESCO, was rejected by the committee in favor of Borejsza's resolution. Among other things, the draft specifically cited the United States as the "source of imperialistic warmongering" in the world. After much prolonged wrangling, the United States representative on the committee, with the support of the British, finally effected some changes in the wording of the condemnation, although

RESTRICTED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

the tone remained close to that of the Party line.

The final document, filled with platitudes designed to attract earnest liberals, in effect placed the responsibility for the absence of peace solely upon the West. Following Borejsza's announcement that the vote would not be considered final until the resolution was signed, it was accepted by a vote of 371 Ayes to 19 Nays and abstentions. To date the full list of signers of the document has not been made public.

The resolution accepted by the Congress called for the organization of "national congresses of cultural workers in defense of peace." The drafters, no doubt, envisaged a loose type of left-wing organization intended for political action and propaganda. Toward this end there was appointed a central permanent liaison committee, numbering 21 representatives from 13 countries. Of this group, nine are Communist Party members, four at least being on Central Committees;nine are ardent fellow-travelers, three possibly Party members;and two are probably fellow-travelers. Only one of the 21 is definitely neither a Communist nor a fellow-traveler.

It is notable that noneof the dissenters to the Congress' resolution were named to the permanent committee despite the thoughtful and hopeful statement issued by the American dissenters:

"We believe that the peace of the world can only be secured if leaders of opinion everywhere understand that liberty loving countries whose social, economic and political systems are widely divergent from each other nevertheless can and must live on the same earth in peace with each other, engaging in friendly relations of commercial and cultural intercourse..We hope, however, that under appropriate future auspices it may be possible to continue the discussion along the lines noted above."

The Communist attitude toward liberal views which do not coincide with the Party line was clearly manifested in an interview given the Polish press by Ilya Ehrenburg, in which he called the eminent dissenters "imbeciles and idiots."

This meeting of intellectuals was designed to attract a large number of non-Communists, and succeeded in asscciating with the Congress the names of many prominent individuals in the cultural and scientific world. The Congress itself was utilized by the Communists,spearheaded by Soviet delegates, as a platform from which they could denounce the West and laud the Soviet Union.

By means of Ehrenburg's mollifying speech,the general social affability and even an apparently conciliatory attitude in the drafting committee, Soviet representatives endeavored to retain the good will of the hopeful liberals. It has been suggested that in future congresses of this type, the Soviet representatives, having profited by these moderate tactics at Wroclaw, may well be more subtle on the theoretical level and less antagonistic in their relations with non-Communist delegates,without, however, deviating from the basic Party line.

The possibility is remote that any constructive measures can emanate from such congresses, whether national or international. The well-disciplined, dogmatic Communists can always be expected to utilize such meetings as sounding boards for their views. They are convinced that "Leninist-Stalinist theory....is the key to understanding the real causes of contemporary wars," and that".... as long as the capitalist system of

world economy exists, the Soviet people must be ready for all contingencies." (A. Leontiev in Pravda October 28, 1946.)

Dr. Julian Huxley, Director-General of UNESCO, who had attended in a private capacity after being assured by Jerzy Borejsza that the Congress would be cultural in scope, dejectedly stated after the meeting:

"This gathering of scientists, writers, and artists from many countries could have provided an opportunity for reconciling in the intellectual and cultural sphere what may broadly be called the eastern and western points of view. I can only express my regret that this opportunity was not taken.... The Congress from the outset took a political turn; there was no real discussion and the great majority of speeches were either strictly Marxist analyses of current trends, or else controversial attacks on American or western policy and culture."

Generally speaking,unofficial congresses,particularly those of intellectuals, women and youth, have demonstrated that a small core of hard-shelled Soviet Communists with definite objectives in mind dominate the group of well-intentioned and earnest delegates who are usually unorganized and without precise and concrete proposals. The Communist representatives, often in the guise of objective liberals, are fortified with a well defined program. The genuine liberals, even though constituting a majority, are usually equipped only with credulity and hope.

Non-Communist intellectuals who attend future meetings of this nature will be foredoomed to disillusionment and frustration unless they come prepared to compete with the Communists and understand the methods used by them.

They will be overwhelmed at the outset unless they insist that the organizing committee extend invitations to a genuinely representative group of outstanding figures in the fields covered by the meeting, without regard to their personal political views.

They will find it necessary to study in advance the parliamentary tactics used by Communists in past congresses, and to consult among themselves regarding the best means of coping with them. Communists achieve domination over such congresses by pushing through their agenda, their rules, and their chosen officials (especially the secretary-general of the meeting) without permitting delegates time either to object or to propose amendments or alternatives. Through foresight and persistence,Communists pack the very important drafting committee with individuals sympathetic to their cause. Working as an organized and well disciplined minority,Communists ride roughshod over the rules of the meeting unless firmly held in check by others who insistently invoke the rules. At Wroclaw, Fadeyev spoke for 50 minutes beyond the 10-minute limit, and Ehrenburg, when requested to yield the floor after 20 minutes, appealed to the audience and continued for another 20 minutes. By steam-roller tactics, Communists attempt to obtain concurrence on resolutions which either blatantly or subtly condemn semi-factual or fictitious abuses in the systems of the Western democracies, while completely ignoring the notorious abuses tolerated or even encouraged by the Soviet Government and its satellites.

Non-Communist participants will find themselves overwhelmed by these Communist tactics of attack and diversion unless they carefully prepare in advance a positive and concrete program and press it forward with organized and energetic methods.

Subversive ORGANIZATIONS AND PUBLICATIONS

The following listed organizations and publications, cited by the House Un-American Activities Committee, are but a few of the proclaimed Communist enterprises which exist in the United States today.

Many people have been duped into joining or supporting these activities without realizing their true character. U.S. citizens would do well to thoroughly investigate before joining or supporting organizations having the words "progressive", "people's", "democratic", "democracy", or "youth" as a part of its name, as these words are frequently used by Communists in the names of many front organizations. Anyone belonging to, supporting, or having knowledge of the members or activities of these organizations will render their country a great service by reporting such information to the proper authorities.

COMMUNIST FRONT

The committee has defined a Communist front as an organization or publication created or captured by the Communists to do the party's work in special fields. Since Communists will not admit their control of a front, it takes them among people who would never willingly act as party agents. It is Communism's greatest weapon in the country today.

COMMUNIST ENTERPRISE

By "outright" Communist enterprises, the committee refers to organizations such as the Communist Party USA, the domination of which by the Stalinists is not disguised. A glance at the compilation will show that organizations of this character are relatively few when compared to the hundreds of fronts that have been set up by the Communist party.

TEN "DON'TS" BY J. EDGAR HOOVER

We can successfully defeat the Communist attempt to capture the United States by fighting it with truth and justice, implemented with a few "don'ts":

Don't label anyone as a Communist unless you have the facts.

Don't confuse liberals and progressives with Communists.

Don't take the law into your own hands. If Communists violate the law, report such facts to your law-enforcement agency.

Don't be a party to the violation of the civil rights of anyone. When this is done, you are playing directly into the hands of the Communists.

Don't let up on the fight against real Fascists, the KKK, and other dangerous groups.

Don't let Communists in your organization or labor union out-work, out-vote, or out-number you.

Don't be hoodwinked by Communist propaganda that says one thing but means destruction of the American Way of Life. Expose it with the truth.

Don't give aid and comfort to the Communist cause by joining front organizations, contributing to their campaign chests, or championing their cause in any way, shape, or form.

Don't let Communists infiltrate into our schools, churches, and molders of public opinion, the press, radio, and screen.

Don't fail to make democracy work with equal opportunity and the fullest enjoyment of every American's right to life, liberty, and the pursuit of happiness.

WEATHER AND AIR OPERATIONS

The importance of short and long range weather predictions cannot be over-estimated in planning and carrying out strategic and tactical air operations. This is particularly true where rapidly changing weather is characteristic of an area of operations throughout the year.

If there were no seasonal changes and the earth's surface were smooth and uniform, the atmospheric pressure zones and the air circulation of the world would be as shown in Chart AU 50a, "USAF Generalized Diagram of Atmospheric Pressure Zones and World Air Movements". (see folded map insert.)

In addition to the alignment of mountain ranges and the distribution of high plateaus and hill lands, climate is one of the most important natural factors influencing the use of land by man. The climatic conditions depicted on charts GH 10a and 11a are mean indications of prevailing winds and high and low pressure areas. These areas are enclosed by isobars which are lines drawn upon the earth's surface through places where the height of the barometer reduced to sea level is the same. These averages, when applied to weather prognostication, play an important part in strategic and tactical operations, both short and long range.

In comparing the 10a and 11a charts it is noted that in the area over the Atlantic Ocean and Europe, isobar configurations in latitudes from 45° northward lack any similarity. Likewise, the variations in the high and low pressure areas are evident in Eastern Asia and over the North Pacific Ocean. In these areas significant and frequent weather changes occur throughout the year in latitudes from 35° northward. In most parts of the world, weather has a distinct seasonal variation.

There are numerous examples in which carefully evaluated weather played a vital role in developing military operational plans.

The Japanese, on 7 December 1941, utilized aircraft carriers concealed within an extensive storm zone which was moving rapidly eastward. This enabled the attack on Pearl Harbor to be launched from relatively short range immediately after the weather cleared. This maneuver had been thoroughly planned and practiced.

In the Greek campaign of 1940, the Italians attempted to copy the strategy and tactics of the German Panzer Divisions. Their failure to recognize the significance of heavy seasonal rains in conjunction with the launching of their campaign resulted in their inability to subdue the Greeks.

In 1942 the German battleships "Gneisnau" and "Scharnhorst" escaped northward through the English Channel and the Straits of Dover under a protective cloud cover. This occurred within the reach of Allied land based aircraft, but weather condidtions, i.e., cloud cover, icing conditions and poor visibility, proved an effective screen.

The detailed weather study undertaken in planning this operation is perhaps typical yet enlightening. Its successful execution was so de-

1660

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

pendent upon a precise knowledge of the particular weather conditions that its timing could hardly be regarded as fortuitous.

Meteorologists on the German General Staff advised their leaders that February would be a suitable month for this escape from Brest. The success of the maneuver depended upon an accurate forecast, and its timing with a weather condition that lasted for no more than six or eight hours. This required a knowledge of the normal weather characteristics in the English Channel (indicating the frequency with which the desired weather conditions occurred, together with an understanding of the sequence of conditions leading up to such a development). Both elements were obtained from a careful study of a catalogued file of daily weather charts. Results proved that February was the most favorable month for the frequent occurrence of moving air mass boundaries, called fronts (a passage of a trough of relatively low atmospheric pressure accompanying the boundary of separation between cold polar air from the Atlantic Ocean and somewhat warmer types of air lying to the East and South). These fronts were accompanied by low ceilings and poor visibility, precipitation, and a high probability of conditions favoring the icing of aircraft in the clouds. It was discovered that the various weather types, characteristic of that region, exhibited an approximate six-day cycle regardless of season. Further, moving troughs or fronts crossed the English Channel, almost invariably, early during the fourth day.

The conclusion drawn was that between February 10th and 12th there was a high probability of a repetition of the desired weather conditions. This was predicted upon the results of a study of the dates of recurrence of like conditions during the month of February for the years 1935-1939.

February, 1935: 6th and 12th

February, 1936: 11th and 13th
17th and 18th,
23rd

February, 1938: 10th and 28th

February, 1939: 10th and 11th,
16th, 22nd 28th

These dates were separated by approximately six days or a multiple thereof in each case and the period between the 10th and 12th appeared in all five years.

The ships left Brest on the night of February 11, 1942 and moved through the English Channel on February 12, 1942, successfully evading opposing forces under cloud cover.

Knowledge of the methods for rapid identification of past weather situations, coupled with the ability to plan an action requiring an accurate prediction of specified weather conditions six to seven days in advance, is of great value in coordinating the striking power of land, sea and air forces, either separately or under a unified command. Similarly, with a thorough foreknowledge of the weather, planners can accurately anticipate the periods when attack is possible and thus can be prepared.

In some instances weather types peculiar to the region will dictate the time for attack, tactics to be employed, and the type of equipment to be used. Both offensive and defensive plans should be developed to allow flexibility in the use of forces in order to permit taking full advantage of a specific weather condition.

1661

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

Future commanders and staff officers will have improved weather advice. The better their understanding of weather, the sounder their tactical decisions will become.

There are four types of weather facilities which are of primary concern to tactical units:

a. The base weather station provides forecasting and observing service directly to using agencies on air force bases and performs staff weather and briefing duty.

b. The weather control (or weather office) serves a number of base weather stations over a large area, provides a long range forecast (over forty-eight hours), forecasts for long distance flights, prepares routine weather maps, weather analysis, and weather forecasts.

c. Mobile weather units provide the services of a base weather station, but they are able to move with highly mobile air force or army organizations. They provide weather service at beachheads, airheads and other locations where fixed facilities are not feasible.

d. The weather reconnaissance squadron supplements normal surface observing facilities. It also provides (in peacetime) tropical storm reconnaissance and conducts research projects. It performs weather observing service for the support of military operations in and over enemy territory. Weather reconnaissance will probably become increasingly important in a future war because of the expected increase in long-range strategic bombardment operations.

Weather information is obtained by commanders from the staff weather officer who is also responsible for presenting weather information to crews at mission briefings. The intelligence officer, in his interrogation of returning crews, inquires as to general route weather conditions to assist himin preparing the intelligence reports.

In joint air-ground operations, weather affects the ground and air units differently. Low ceilings and poor visibilities which may severely limit air operations may be of no concern to ground units whereas mud, floods and cold, which hamper surface operations, will have little effect on the air units. There must be a mutual understanding of the weather problem by the air units and the ground units to insure the fullest cooperation.

Weather can be a major problem in, and always exerts an influence on, planning and conducting military operations. The wise commander will know the weather characteristics of his area of operations and use them to his advantage.

THE BOOK SHELF

RECOMMENDED READING FOR YOUR OFF DUTY HOURS

TITLE: The Atmosphere and its Characteristics

SOURCE: Aeroplane 18 November 49 pp 672-73; illus.

ADDRESS: Aeroplane, Bowling Green-Lane, London, E. C. 1, England.

The Earth's atmosphere is currently defined as consisting of four concentric gaseous layers, the troposphere, stratosphere, ionosphere, and exosphere. These layers provide a gradual transition from the atmospheric characteristics as we know them at sea level to where the exosphere merges with interplanetary space. Vertical pressure distribution increases constantly with increasing height. The troposphere extends from sea level to about 35,000 ft. at middle latitudes, but the height varies from 54,000 ft at the equator to 28,000 ft at the poles. Temperature in the troposphere steadily decreases with increasing height. In the stratosphere the temperature is at first constant, then increases to a maximum in the ozone layer. The pattern of the atmospheric winds is not completely understood. Evidence shows extremely high winds at present in the stratosphere and ionosphere. The comparatively small distances to which man has explored the atmosphere are compiled in a chart. Only representative average values are given because atmospheric characteristics vary with time of day, latitude, and season. The greatest height so far attained is that of not quite 14 miles, reached by Anderson and Stevens in 1935.

TITLE: Aircraft Proximity Indicator

AUTHOR: C. Adler, Jr.

SOURCE: Avia. Ops. Sep '49, (12-3 Mthly); pp 42-43; illus.

ADDRESS: Aviation Operations
Conover-Mast Corp.
205 East 42nd Street
New York 17, N.Y.

The growing volume of air traffic has increased the danger of mid-air collisions. An aircraft proximity indicator device is therefore proposed to warn the pilot of his nearness to other aircraft. A sketch is presented showing how the two horn antennas installed in the nose of an airplane would receive impulses from aircraft approaching from the left and right and would afford an overlapping coverage forward. Flashing lights in the cockpit would give the relative position of the approaching plane. Sketches also show how the pilots would turn their aircraft in accordance with the signals of their proximity indicators. The range of the indicator is to be variable from the immediate vicinity to 20 miles.

Standard of

IDEOLOGICAL TRAINING OF SOVIET TROOPS

SOVIET AGITATION AND PROPAGANDA STRESSED

In an article in "Red Star", Colonel-General F. Kuznetsov, indicates that emphasis on the political training of service personnel is stressed in order to achieve the highest level of Marxist-Leninist indoctrination. The following is extracted from that article:

"On the initiative and instructions of Stalin, the Central Committee of the CPSU has handed down a number of important decisions on questions of ideological work in recent years. These decisions deal with the necessity to educate the Russian people in the spirit of Soviet patriotism and devotion to the interests of the Socialist state; in the spirit of inflexible will and the capacity to oppose any perfidious method of the foreign intelligence services; in the spirit of readiness in any conditions and at any price to defend the interests and honor of the Soviet State.

"This demand applies wholly and fully to the political bodies and party organizations of the Soviet Army, Navy, and Air Force.

"The successful solution of this immensely important problem is only possible on condition that military cadres are armed with Marxist-Leninist theory, that the political education of the personnel of units, formations and ships is skillfully organized."

PROPAGANDA AND AGITATION

"Bolshevik propaganda and agitation is a most important component part of ideological work. On its organization and scope depends the success of all political-educational work in the armed forces. For this reason, commanders, political bodies, and party organizations must give their rooted attention to all forms of propaganda and agitation.

"The study of Marxist-Leninist training has recently been carried out in a better organized way in the majority of units and formations with the result that their ideologi-

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

cal level has been raised.

"The majority of officers, generals and admirals last year finished the study of 'The Short Course of History of the CPSU' and began the study of revolutionary theory in other works of the classical writers of Marxism-Leninism. During the current year, a certain improvement has also been achieved in propaganda by lectures - the scope has been widened and the subjects have become more urgent.

"The increase in the standard of Marxist-Leninist education among officers has brought about an improvement in their service activities as well as in the training and instructions of the troops under their command."

UNINTERRUPTED CAMPAIGNISM A NECESSITY

"Every study of Marxist-Leninist training should be planned so that: it educates people in the spirit of Soviet patriotism and in hatred of the enemies of our Motherland; it reveals to its hearers the whole greatness of the socialist system and its advantages over the capitalist system. An increase in the officer's Communist awareness and the improvement of his work in training and instructing the men under his command must be the result of this theoretical instruction. The Marxist-Leninist training of officer cadres is a most important link in the whole of our propaganda. On the successful solution of this problem depends nine-tenths of the fulfilment of all the tasks in the field of the ideological-political education of the personnel of units and ships.

"In the system of Party-political work, an important place belongs to mass political agitation among the personnel of our Armed Forces. Political information, reports, conversational meetings, assemblies, pictorial propaganda and all other forms of mass agitational work are called upon to give considerable assistance to the command in the solution of the problems which face ships and army units.

"One of the most important defects in agitational work is campaignism. Some of our comrades forget that the value of Bolshevik agitation lies not only in its high principles and mass nature but in permanence, and its uninterruptedness.

"Agitation has occupied and still occupies a most important place in the day-to-day activities of military-political organs and Party organizations. Discussions on stirring themes of the day and collective readings of the most important newspaper material plus local broadcasting and various forms of visual agitation have entered firmly into the life of men of the service, expanding their outlook and developing their patriotic consciousness. The Bolshevik agitator has become the closest friend and advisor of soldiers, sailors and airmen.

"The strength of our political agitation lies in its truthfulness and high principles; in its Bolshevik belligerence. It not only discloses the meaning of the events which are taking place and explains the latest measures taken by the Soviet state in the problems put forward by the Party, but it also mobilizes the masses to carry them through.

"The agitator must have the ability to coordinate organically the concrete tasks of military and political training on board ship or in a unit with the nation-wide tasks and with the nation-wide struggle for the further consolidation of the

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

economic and military might of our Motherland.

"Soviet reality provides agitators with a great amount of material for developing the Soviet National pride, and with the opportunity for creative initiative in military matters.

"Our Bolshevik agitation is called upon to show by clear and convincing facts the immeasurable superiority of the Soviet society over the corrupt ideology and morality of the imperialist bourgeoisie. In ships and units discussions are regularly held on events abroad, but unfortunately the explanation of international events does not always reveal the true rapacious nature of present-day imperialism. Meanwhile, the teaching of hatred of imperialism and its servants is a primary task of our agitational propagandist work. Accurate and ardent Bolshevik speech unmasking the aggressive policy of the warmongers serves as a mighty weapon in educating in the spirit of burning hatred and contempt for the imperialist bourgeoisie."

MATS WORLD-WIDE AIR RESCUE SERVICE

Washington (AFPS) - The Military Air Transport Service recently announced reorganization of its world-wide Air Rescue Service and the establishment of a unit in Germany.

The Air Rescue Service performs search and rescue service for both military and civilian airmen and aircraft lost in remote areas. It has about 3,700 Air Force officers and men assigned to this duty and more than 350 planes and helicopters available for service.

Under the reorganization, there will be seven rescue squadrons, each with four rescue flights, and one under the Alaskan Air Command.

The new squadron in Germany, the first to be established in Europe, will be based at Weisbaden with three existing flights being attached to it.

USAF ESTABLISHES SPECIAL WEAPONS COMMAND

The U.S. Air Force recently changed the designation of the Field Office for Atomic Energy, located at Kirtland Air Force Base, Albuquerque, New Mexico, to the Air Force Special Weapons Command.

The new organization assumed command status and is responsible for the service and development testing, within the field of Air Force interest and responsibility, of equipment and techniques relating to atomic energy.

No transfers of personnel, either military or civilian, to or from Kirtland AFB, resulted from the changed designation of the unit. Existing facilities will be used by the new organization.

Commanding General of the Special Weapons Center is Brigadier General Howard G. Bunker, formerly CG of the Field Office for Atomic Energy.

TITLE: Storm Snoopers Part II
AUTHOR: W. Marsh
SOURCE: Boeing Magazine July'49 (19-7 Mthly); pp-12-14; illus.
ADDRESS: Boeing Magazine
7755 East Marginal
Seattle, Washington

The Air Weather Service, now a firmly-established part of the Air Force, has, in effect, set up reliable weather-observation facilities where no weather stations of any kind existed before. The most important function of the present weather reconnaissance-flying squadrons is to provide a complete picture of daily weather movement in their operating zones. The 375th Reconnaissance squadron, based at Eielson AFB near Fairbanks, Alaska, and the 514 Reconnaissance Squadron, based at Harmon AFB, Guam, have saved many lives by tracking an approaching hurricane or typhoon and sounding the warning. By following a typhoon, the weather-reconnaissance crews can observe its intensity and direction of movement and issue warnings to ships and planes and to residents of land areas in its path.

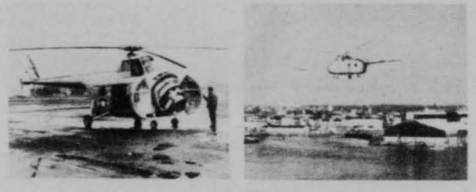
COVER PHOTO



H-19 HELICOPTER

Newest entry into the Helicopter Field is the U.S. Air Force's 12-place Sikorsky H-19. It was designed especially for search, rescue and liaison purposes. The 'copter carries a two-man crew and ten passengers. As a hospital ship, eight litter patients and one attendant can be transported. It is equipped with a power-operated hoist for hauling passengers into the cabin while the rotary-wing craft hovers over the surf or inaccessible land areas.

An unusual feature of the H-19 is the location of its 600 hp Pratt and Whitney Wasp engine in the nose of the aircraft where it is easily accessible for ground maintenance.

The H-19 has a combat renge of 280 miles. Top speed is 100 mph. It has a service ceiling of 12,500 ft., and can carry a useful load of 2962 lbs.

An added advantage is that the rotor can be removed and the ship fitted into a transport plane for ferrying to a field near the scene of operations.

100 THINGS YOU SHOULD KNOW ABOUT COMMUNISM AND RELIGION

PART II OF II PARTS

47. HAVE THE RUSSIAN COMMUNISTS EVER TOLERATED RELIGION?

While Communists do not have religion themselves, they have at times permitted personal faith as long as the churches involved adhered to Communism's stringent restrictions on missionaries, welfare and charity work, and religious education of children.

48. WHY IS THIS?

The Russian Communists need cooperation from religious-minded people in their own country, and they also want religious people outside the borders of Russia to help the Communists seize control of other countries. "Toleration" of religion is just a tactical maneuver in Communism's war on civilization. The long-range strategy of total destruction has not changed.

49. WHEN WAS THIS "TOLERATION" TACTIC FIRST USED IN RUSSIA?

Although very minor concessions to the church were allowed in 1923 and 1935, after two of the most severe waves of religious persecution, the first significant pretense of religious tolerance came in 1938. A general order went out to "avoid jarring the religious sensibilities of the believers."

50. WHY?

Because Stalin was afraid of Hitler's growing power and wanted the Russian people to be unified and cooperative in case of war.

When war did come, the Russian Communists used priests to appeal to the Russian people for support of the war. The Moscow radio actually called upon "God-loving inhabitants" of German-occupied countries to rise in defense of religious freedom. References to God were even found in Stalin's papers and addresses.

The Government also temporarily closed its atheistic publishing concerns as a war maneuver. Churches in Moscow took on a blaze of outward life.

51. DID THIS MEAN STALIN HAD LOST HIS NERVE AS AN ATHEIST?

Not at all. He simply turned the church into a weapon for his own use on the home front then, and such it remains today.

52. DO THE COMMUNISTS PRETEND TO TOLERATE RELIGION TODAY?

No. Since the end of World War II, the Russian Government has renewed open war against religion in all forms, although in some countries Communists pretend to tolerate it to serve their propaganda purposes.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

53. HOW DO WE KNOW THIS?

A recent statement in an official Soviet newspaper listed the stamping out of religious faith "by systematic, scientific, antireligious propaganda" as "the most important task in the struggle for the triumph of Communism in the U.S.S.R."

Communist Party members in Russia, both young and old, were publicly ordered recently to work against religious beliefs.

Radio Moscow is expounding atheism and bombarding the people with the well-known Marxian theme, "Religion is the opium of the people".

54. HOW DO THE COMMUNISTS CONTROL THE ORTHODOX CHURCH?

Through the Soviet Government's State Council on Orthodox Affairs headed by Georgi Karpov, an atheist Communist who for years had been a member of the Soviet Secret Police. Every decision of the church officers must be approved by Karpov, even down to the point of getting his permission to go on a trip.

55. HOW DO AMERICANS OF THE RUSSIAN ORTHODOX FAITH FEEL ABOUT THE STATE OF THEIR FAITH IN RUSSIA?

Russian Orthodox bishops and priests here refuse to accept the Russian church any longer as a guide or source of religious authority.

56. IS THE ROMAN CATHOLIC CHURCH RESTORED IN RUSSIA?

In no way. One priest is allowed to stay in Moscow for the benefit of foreigners there, but the church is entirely shut off from the people of the country as a whole.

57. HOW ABOUT THE JEWS?

The same. Hebrew, the sacred language of the Judaic faith, is forbidden by law. Feast days, religious development and enjoyment for Jews have been suppressed as harshly as for any others.

58. HOW ABOUT PROTESTANT GROUPS?

They have been crushed.

59. WHAT HAS COMMUNISM DONE TO RELIGION OUTSIDE RUSSIA?

It has seized church and synagogue property and killed church leaders wherever and whenever Communism has gained control.

Where it has not yet gained the upper hand over the country as a whole, it has tried to corrupt religion from within by setting sect against sect and creed against creed.

60. ARE COMMUNISTS TRYING TO CORRUPT RELIGION IN THE U.S.A.?

Yes.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

61. WHAT IS THEIR METHOD?

The Communist Party of the United States assigns members to join churches and church organizations, in order to take control where possible, and in any case to influence thought and action toward Communist ends.

It forms "front organizations", designed to attract "fellow travelers" with religious interests.

It tries to get prominent religious leaders to support Communist policies, disguised as welfare work for minorities or oppressed groups. In the words of Earl Browder, former head of the Communist Party of the USA:
".....By going among the religious masses, we are for the first time able to bring our anti-religious ideas to them."

62. WHAT IS A "FRONT ORGANIZATION"?

An organization created or captured by the Communists to do the Party's work in special fields. The front organization is Communism's greatest weapon in this country and takes it among people who would never willingly act as Party agents.

63. WHAT IS A "FELLOW TRAVELER"?

One who sympathizes with the Party's aims and serves the Party's purposes without actually holding a Party card.

64. HOW CAN I SPOT THEM?

Many organizations have been listed as Communist fronts by the Attorney General and this Committee. You can get a list of these by writing to the House Committee on Un-American Activities, Room 226, Old House Office Building, Washington, D. C. (See Subversive Organizations and Publications - Page 6)

To show up a fellow traveler, ask him to name ten things wrong with the United States and then ask him tc name two things wrong with Russia. He will be on Russia's side every time.

65. ARE AMERICAN COMMUNISTS ATHEISTIC?

Yes.

66. CAN A COMMUNIST EVER HAVE RELIGIOUS BELIEFS?

When he first joins the Party, A Communist may still have some religious faith but it soon goes or he fails as a Communist.

67. WHAT HAPPENS TO A RELIGIOUS PERSON WHO TURNS COMMUNIST?

The Party ridicules his religious ideals and dins atheist propaganda into his ears, day and night, in an attempt to convert him to atheism.

68. WHAT IF A NEW COMMUNIST REFUSES TO RENOUNCE RELIGION?

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

He is soon ousted.

69. WHAT HAPPENS TO A PERSON WHO IS EXPELLED FROM THE PARTY?

He is hounded for the rest of his life.

70. HAVE THE COMMUNISTS USED BLASPHEMOUS PROPAGANDA AGAINST THE CHURCH?

If there is any doubt in your mind as to the vicious and blasphemous propaganda Communists are using against religion, then go to your public library and read a typical example of it entitled"Goodbye, Christ,"by Langston Hughes.

It is so atrocious that we will not reproduce it here, but even so, it is mild compared to the atheist propaganda in Moscow.

71. HOW DO COMMUNISTS WORK AMONG CHURCH PEOPLE, SINCE THEY THEMSELVES ARE SUCH HATERS OF RELIGION?

Communists are two-faced.

In their secret Party meetings, they make plans to destroy religion.

In public, they say religion and Communism should be friends and that both are working toward the same goals.

72. ARE THERE COMMUNIST CLERGYMEN?

Unfortunately, there are.

73. DO THEY ADMIT THEY ARE COMMUNISTS?

With but a few exceptions, the Party requires Communists to keep their membership secret.

74. WILL YOU GIVE AN EXAMPLE OF THE "OPEN" TYPE OF MEMBERSHIP?

The Rev. Claude C. Williams, a Presbyterian minister, whose congregation expelled him for Party activity. The Rev. Eliot White, retired Episcopalian minister, who served as a delegate to a Communist convention and lectured at Communist meetings.

75. ARE THEY IMPORTANT?

Not as important as the others who have joined the Communists fronts which the Attorney General and this committee have declared to be "subversive".

76. DO YOU MEAN THAT JUST BECAUSE A CLERGYMAN JOINS OR SPONSORS ONE OR TWO COMMUNIST FRONTS FOR ONE REASON OR ANOTHER, HE IS PLAYING STALIN'S GAME IN AMERICA?

No. We are talking about those clergymen who have over a period of years consistently followed the Party line and joined not one or two fronts, but

RESTRICTED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

ten, twenty, or thirty. These are the core of agents the Party depends on in the religious field.

77. BUT COULDN'T SOME OF THESE CLERGYMEN BE INNOCENTLY MISGUIDED IN THEIR ATTEMPTS TO DO GOOD?

Well, they have followed every crook and twist of the Communist Party line. Would you excuse that in your minister's case?

78. IS YOUR COMMITTEE INVESTIGATING RELIGION?

Certainly not. Religion is not under any sort of investigation by the House Committee on Un-American Activities, nor is any sect, creed, church, or individual, so far as his religion is concerned.

79. THEN WHAT'S THIS ARTICLE FOR?

To help you protect your religion and faith from Communist attack by showing you exactly what the Communists intend.

80. BUT IS COMMUNISM A "REAL" DANGER INSIDE OUR CHURCHES?

J. Edgar Hoover states:
"I confess to a real apprehension, so long as Communists are able to secure ministers of the gospel to promote their evil work and espouse a cause that is alien to the religion of Christ and Judaism."

81. IS COMMUNIST PROPAGANDA EVER SNEAKED INTO CHURCH PUBLICATIONS?

Yes. For instance, the Christian Register, official Unitarian publication, has carried Earl Browder's eyewash that a good Christian can be a Communist. It is significant that the minister responsible for doing this has since been removed from his editorship by the church.

82. DO COMMUNIST PROPAGANDISTS EVER ACTUALLY GET BEFORE CHURCH GROUPS AS SPEAKERS?

Yes. For example, the head of the Communist Party, on one occasion at least, spoke at Union Theological Seminary in New York City.

Only a few months ago, the Legislative Secretary of the Communist Party addressed a conference of 100 ministers in Washington, D. C.

83. WHAT ABOUT CHURCH YOUTH GROUPS?

Young Communists are ordered to join them.

84. WHY?

For two reasons: To win over youth to Communism and atheism, and to turn their groups into tools of the Communist Party.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

85. IS THIS DONE OPENLY?

No. Communist youth, like Communist adults, work under cover. They won't admit being Communists if you ask them unless and until their Party officers direct them to do so.

86. IS THE YMCA A COMMUNIST TARGET?

Yes. So is the YWCA.

Also, church groups such as the Epworth League.

87. DO YOU MEAN EVERY EPWORTH LEAGUE OR YWCA IS A COMMUNIST HIDE-OUT?

Of course not. But we do mean that Communists do dig into such groups any way and any time they can.

We do mean they have dug into such groups, and are at it today.

We do mean that if you want to keep your own organization fit for your own family's membership, you had better stay on the alert.

88. HOW ELSE DO COMMUNISTS SPREAD ATHEISM?

Indirectly in Communist schools such as the Jefferson School of Social Science in New York, and the California Labor School.

Also in the atheistic schools for children operated throughout the country by the International Workers Order.

89. WHAT IS THE PEOPLE'S INSTITUTE OF APPLIED RELIGION?

One of the most vicious Communist organizations ever set up in this country. Declared subversive by the Attorney General.

90. WHERE IS IT LOCATED AND WHO ARE ITS OFFICERS?

4105 1/2 Third Avenue, South, Birmingham, Alabama.
Rev. Claude C. Williams, director; Edna Joyce King, executive secretary; Owen H. Whitfield and Winifred L. Chappell, associate directors; Carl Haessler, Calla E. Tennant, and Clara M. Vincent, trustees; Cedric Belfrage, research director.

91. WHAT DOES THIS INSTITUTION DO?

It teaches Communist ideas, pretending that they are Christian ideas.

92. WHAT IS THE METHODIST FEDERATION FOR SOCIAL ACTION?

A tool of the Communist Party, denounced by numerous loyal American Methodists. It claims to speak for 17 Methodist Bishops and 4,000 clerics and laymen. Not an official church organization.

RESTRICTED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

93. WHERE IS IT LOCATED AND WHAT IS IT TRYING TO DO?

150 Fifth Avenue, New York, New York. Although strictly unofficial as a "church" organization,it is trying to use the prestige of the Methodist Church to promote the line of the Communist Party.

94. WHAT IS THE "PROTESTANT"?

A magazine which fanatically spreads Communist propaganda under the guise of being a religious journal.

Its avowed purpose is to "build a bridge" between Christendom and Communism. Boasts support of 6,000 ministers but not actually connected with any official religious organization.

95. WHERE IS IT PUBLISHED AND WHO ARE THE OFFICERS?

It is published by Protestant Digest, Inc., at 521 5th Avenue, New York, New York. Editor: Kenneth Leslie; Associate Editors: James Luther Adams, John Hammond, Gerald Richardson.

96. SHOULD SUCH ORGANIZATIONS HAVE ANY CHURCH'S SUPPORT?

Ask your own pastor.

97. HOW CAN WE COMBAT THEM?

Reread this article. Show it to others. Become as interested in protecting your religion as the Communists are in destroying it.

98. ARE THE COMMUNISTS JUST TRYING TO DESTROY YOUR CHURCH?

No. They're also out to get your job, to get your union, to get your farm, to get your school, to get your property, to get your Government. They're out to get YOU and make you a slave of Communism from cradle to grave.

If they can wreck your religion, that makes you just so much easier to capture and enslave.

99. WHEN AND HOW DO THEY WORK ON ALL THESE OTHER ANGLES?

Look up and study other Intelligence Information Bulletins which expose the Communist Party in other fields.

100 Things You Should Know About Communism in the U.S.A. (Int Info Bul #8)
100 Things You Should Know About Communism and Labor (Int Info Bul #30)
100 Things You Should Know About Communism and Education (Int Info Bul #26)
100 Things You Should Know About Communism and Government (Int Info Bul #46 and 47)

100. CAN THE COMMUNISTS WIN IN ALL THIS?

It's up to you.

POLAR GUIDE

THIS IS THE EIGHTH IN A SERIES OF ARTICLES ON ARCTIC INDOCTRINATION

Chapter 18 - Land Survival (Continued)

SHELTER

In Summer, if the weather is mild, you may need protection only from the insects. In winter, however, you can't stay in the open and expect to live, unless you are on the move. You must have shelter even if it is only a hole burrowed in the snow. The type of shelter will depend mainly upon what materials are available, what you need shelter from (wind, rain, snow, cold, or insects), and how long you expect to remain in one location. Regardless of the type, however, the shelter must provide adequate ventilation - first, to prevent asphyxiation, second, to allow moisture to escape.

If suitable natural shelters, such as caves or rock shelves, are available, you need not build. If you must build, however, be sure to pick a good location. In summer, choose a campsite that is dry, relatively free from insects, and near fuel and food. Avoid areas that might become flooded. In summer, the lee of boulders and shelving rocks provides dry campsites. To escape insects, look for a cold lake, a breezy ridge top, or a place that gets an onshore breeze. During insect season, sites in forests and near rapid brooks are undesirable. During winter, choice of a campsite will depend on protection from wind and nearness to fuel and water. In high mountains and rugged terrain, avoid areas that you suspect are subject to avalanches, floods, rockfalls, and battering by winds. The bases of steep slopes are to be avoided because of falling rocks. As a rule, a camp well up on a valley slope is more comfortable than one on a valley floor.

Consider all these factors. Remember also that you're not building a display home or an apartment house. The smallest and simplest type of shelter that meets your needs and can be made with materials you have on hand is the best shelter for you.

Arctic Survival Tent

One of the best types of survival shelters, easily put up and giving good protection, is the Arctic Survival Barren Land Tent. This tent, which is now in production, will soon be available in the field as part of the survival equipment carried in the plane. It accommodates three men comfortably and four men satisfactorily. It is high enough to permit one occupant at a time to stand in a stooping position while dressing or undressing. Yet it is

1677

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

not so high that it permits the heat to rise above the space occupied by the personnel. The tent weighs only 25 pounds but is strong enough to withstand winds of 100 mph and gusts of 125 mph.

Fabricated of neon-red, fluorescent nylon material, it is useful also as a visual signal. The fabric of which it is made is water repellent and excludes wind-driven snow and water, but, at the same time, it permits the escape of CO and CO_2 to minimize the chances of asphyxiation. There is no waterproof coating or impregnation in the fabric, however, and the tent remains pliable and lightweight. Another feature of the tent is its built-in floor, which increases protection and makes it easier for inexperienced personnel to pitch the tent.

The tent is of "A"-pole construction. Four sectional duralumin poles slide from the bottom through cloth tubes to the leather reinforced apex of the "A". They are tied in at the bottom.

Two men can erect the tent easily. Proceed as follows:

1. Insert and tie in the poles.

2. Stake down the apron securely.

3. Measure out the proper distance for the ridge rope and wall stays, and drive in the stakes. Tie the stays to the stakes to prevent the tent from blowing away during erection in high winds, making sure first that the "A", formed by the poles at the end, points into the wind. (On the ice pack or when the ground is too hard to drive in stakes you can use blocks of ice or snow to hold down the ropes.)

4. The man of the downwind ridge rope then takes up the slack as the man on the upwind ridge rope pays out.

5. When the ends are perpendicular, the man who is upwind makes his end of the rope fast and then the man who is downwind takes up the slack and makes his end fast.

6. Make the side stays taut, and the tent is pitched.

Parachute Shelter.

Paratepee.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Willow Shelter.

Lean-to.

There is an egg-shaped tunnel entrance attached to each end of the tent. This type of entrance makes it easier to enter and leave the tent and provides a means of closing the entrance completely to exclude wind-driven snow during blizzards, or to adjust the opening in such a way as to afford proper ventilation. These tunnels are advantageous also, in that, by tying them from the inside and placing equipment in them, you provide more room in the tent for personnel and, at the same time, modify the flat surface of the end to one that offers less resistance to the wind.

Still another feature of this tent is a disposal hole,12 inches square, fabricated at the left-hand corner of the floor for use as a latrine and for wastes from camp living. This hole is covered by a flap that extends 2 inches over all sides. It is sewn on one side and tied down on the opposite side by means of loops and tie tapes.

Airplane Shelter

In the summer, you can live in the airplane comfortably if you make it tight against mosquitoes, but be sure to cook outside to avoid the danger of explosion. In the winter, the airplane is a very poor shelter, as the metal carries heat away very rapidly from any source of heat you have, including your body. Any type of shelter involving the use of the airplane, as for example, a shelter made by building up blocks of snow to the wing and throwing a tarpaulin over it, is a very poor, even dangerous, type of shelter. It is poor because the metal of the airplane conducts the heat away from the shelter and the wind frequently raises the wing, releasing the warm air in the shelter. It is dangerous because of the gasoline in the wing. You will be much better off with any kind of improvised shelter not in direct contact with the airplane.

Parachute Shelter

For solid comfort, especially in drizzly weather and during the bug season, the best shelter is a tepee made from your parachute. In it you can cook, eat, sleep, rest, and make signals—all without going outdoors.

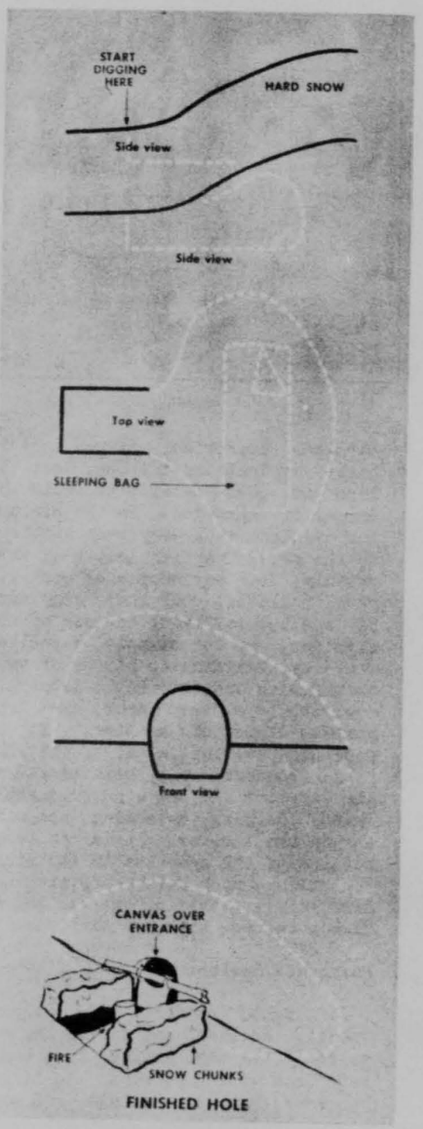
1679

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED



Building a Snow Hole.

To build a paratepee, you will need a number of good poles 12 to 14 feet long and the parachute. The details are described in the booklet in your parachute pack, "Emergency Uses of the Parachute".

You can make a simpler parachute shelter by using a single pole as a center pole, or even by holding up the center of your tent with a rope tied to a limb on a tree.

You can improvise a simple pup tent by placing a rope or pole between two trees or stakes and dropping your parachute over them. Stretch the corners down and secure them with stones or pegs.

Willow Shelter

On the tundra, where willow trees are available, you can make a satisfactory shelter by using a number of them tied together securely as a framework over which to put your tarpaulin as a cover. You can also use snow shoes from your emergency kit, skis, or parts of your plane as supporting parts of this framework. There is no particular detailed design for this type of shelter, except to make it in such a way as to provide only enough room for you, your extra clothing, and your emergency equipment. The open end of this shelter, as in any other type of shelter, should be at right angles to the prevailing wind. Arrange the tarpaulin cover over this shelter in such a way that you have a flap over the entrance to protect the entrance from drifting snow. Pack down all the edges of the tarpaulin around the shelter with snow to keep the wind from blowing snow under it.

Lean-to Shelter

In a wooded area, a lean-to makes

THIS PAGE IS UNCLASSIFIED

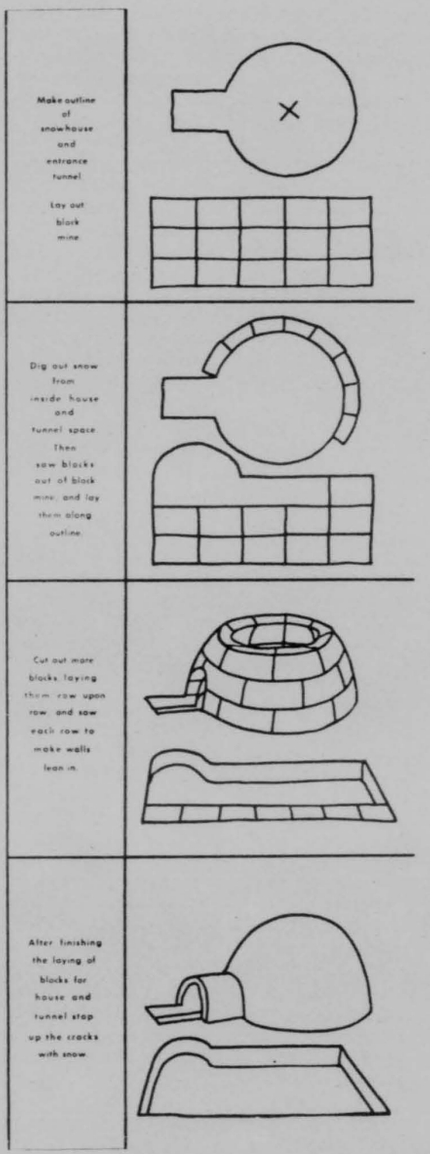
a good temporary shelter. Support a pole between two trees at a height of 4 to 6 feet from the ground by resting it on the branches or by binding it to the trees with a rope or even tough bushes or spruce roots. Lean poles against this ridge pole, closely together and slanting gently down to the ground. If the trees are too scattered to provide support for the ridge pole, cut partly through a single tree a few feet above the ground and push it over. The branches will hold it in a more or less horizontal position and will provide the framework for a satisfactory shelter. Cover the poles of the shelter with pine or evergreen boughs, with the pine needles facing downward. If you have a tarpaulin, you can use it to good advantage as a roof for the shelter. Make your fire in front of the shelter and, if possible, set up a wall of green logs behind your fire to reflect heat toward the lean-to.

Ice and Snow Shelters

On pack ice or snow covered barren land you have your choice of two methods of building a shelter - you can either dig in or build up. Digging in is easier and is more practicable for a man who is alone.

Snow Hole. The first thing to check for before digging in is the quality of the snowdrift. If the snowdrift is pretty compact and has a hard crust on it, you will be able to make a safe snow hole in it. Where the snow throughout the drift is light and fluffy, however, it is likely that the next heavy wind will move the drift - perhaps even blow it away altogether.

The larger the snow hole you attempt to dig, the more work it will be and the more heat you will require to stay warm in it. Don't try



Building a Snow House.

1681

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

to dig a hole large enough for your whole family. All you need is enough space to get yourself, your clothes, sleeping bag, and some small pieces of emergency gear inside. Even that will take the best part of a day.

The best type of hole in a drift or edge of a snow bank is one that goes straight into the bank far enough to reach old, hard snow, then extends parallel to the drift, forming a "T" shape. The tunnel into the drift will serve as your entrance way and therefore should be no larger than is necessary for you to crawl into and throw out the snow you remove while digging your sleeping hole.

When you start digging into the drift, you will probably find the snow soft enough to dig out with a shovel. As you get deeper into the drift, however, into the older and more compact snow, it is best to cut out chunks of snow with a saw. If you have no saw, use your shovel as a knife, cutting out chunks of snow by jamming the shovel into the snow and prying out the chunks.

Make your sleeping hole long enough to permit you to stretch out and high enough to give you head room while sitting down or crawling in and out. Scoop out a shelf on one side of the hole for your candles. In such a small hole, a single candle will soon make it warm enough for you to shed your parka and outer trousers. The candle will produce enough heat also to melt some of the surface snow in the hole. Make the ceiling of the hole dome-shaped, therefore, so that the melted snow will run down the sides instead of dripping. The arch shape will also give greater structural strength to your shelter.

Cooking in the hole is dangerous because your stove may tip over and ignite your clothes or some survival equipment. Besides, there is the danger of carbon monoxide. A good place to set up your stove is right outside the entrance way. To break the wind, pile up the chunks of snow you sawed out in order to make your hole. Work them up in the form of a wall about four feet high. This will not only protect your stove from the wind, but will also serve as a good windbreak for your entrance. To make the entrance even more windproof, you can fashion a cover from your seat cushions, parachute, or other materials.

During the process of digging out the snow hole you will undoubtedly get warm enough to sweat. Shed your outer garments to prevent sweating, but be sure to roll them up tightly and put them into the plane or some other sheltered spot to prevent snow from accumulating on them. Remember, too, that you will get wet from the snow in digging this shelter; so set aside some dry spare clothing into which to change when you're through. An anti-exposure suit, if you have one, is an excellent outer garment to wear while digging a snow hole.

Snow holes built in the manner just described are excellent shelters but training stations have shown that a number of men dislike snow holes because of claustrophobia and unfounded fears that the snow hole might cave in, that they might become asphyxiated in it, or that the entrance might become so covered over with drifted snow that they might not be able to get out. These fears have no basis in fact. Snowdrifts of hard-packed snow with crusts on them are strong and sturdy. Snow is an excellent insulator because of the large amount of dead air in it and, for the same reason, provides sufficient air to enable

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

you to breathe even when the hole is completely covered over. As for drifted snow piled up over your entrance way, if you take your shovel into the snow hole with you, you won't have to do more than a little pre-breakfast PTin order to get out.

Snow House. Another kind of shelter that utilizes all the insulating and structural qualities of snow is a house built of snow blocks. This type of shelter can house more than one person, and therefore two or three crew members can team up and build one.

Pick a spot where there is at least a foot of snow between you and the ground or ice. Figure out how much space you'll need - a house 6 feet in diameter is sufficient for one man, 8 to 10 feet for two or three men - and draw a circle that size in the snow. Probably the best way to draw the circle is to set up a center point (a stick or shovel) and describe a circle about it. After drawing the circle to the proper diameter, use a shovel and dig the snow outof the space in the circle. Since space inside snow is the requirement,it doesn't matter whether you build up or dig down — and digging is easier than building. So, if you have enough snow under you, dig down a couple of feet. While you're at it, dig yourself an entrance ditch along a line perpendicular to the prevailing wind.

After finishing the digging, start manufacturing blocks for the walls and roof of your house. Again lay out your work first by drawing lines on the snow surface. Keep your block mines close to the snow house to save lugging blocks any farther than necessary. Draw parallel lines on the snow about 15 inches apart and 14 feet long. Then draw more lines perpendicular to these, separating the surface of the snow into rectangles about 15 inches by 20 inches. You're now ready to start the block making. Saw down along the two outside 15-foot lines, cutting at least 15 inches deep. Then dig the snow away for several feet along the outer sawed line, cut under the line, and saw across the line to get your first block out. This one is the hardest. After you have removed this block, you can stand down in the hole and wield the saw with fine results, making all the 15" x 15" x 20" blocks you need. Carry the blocks over to the dug out area and set them around the outside of the circle on top of the surface snow to form the first ringof blocks.

It's time now to decide how high the dome is going to be. This depends, of course, on how far you've dug into the snow, how tall you are, and whether you want a palace in which you can stand or a hut in which you can sit. In making this decision, remember that the larger the house, the more energy you'll have to use to build it and the more fuel to heat it. Both are precious items in the polar regions. Don't figure on too gigantic a project.

Once you figure how many snow blocks high the house is going to be, you're ready to cut off the top of the first layer of blocks at an angle which will cause the next ring of blocks to lean in toward the center of the snow house. This repeated process - laying a ring of snow blocks, cutting off their tops at an angle, then laying another ring on top — will give you the dome shaped roof. A saw is the best thing for cutting off the angular wedge of snow from the tops of each ring of blocks. Stand inside the house and use a little mental geometry to determine the angle at which to cut each ring of blocks. This angle of

1685

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

cut increases as you approach the top of your house.

Keep on cutting, hauling, and setting up rings of blocks, trimming off the excess and cutting the tops at the proper angle, until you reach the top. The last block is the toughest, and there's no secret process or magic word to aid in getting it into place at the very top. Just look at the hole into which the block must fit, and cut out a block as close to that shape as possible. Lean over the snow house and drop it on. Then get inside and use the saw to trim it to fit.

Even an experienced builder finds that there are cracks between blocks and an irregular and rough shape on the inside when he's through. Now's the time to correct that. Fill the cracks with as moist a snow as you can find. Use it as a putty and you'll have a cozy,draft-free house. Then shave the inside of the house into a regular smooth surface and when you light a candle or gas stove, the melting snow will run down the sides instead of dripping on your clothes and sleeping bag.

There are still two things to do to put on the finishing touches - first, cover the entrance ditch with blocks to make a tunnel; then, provide a means to ventilate the house. The method of ventilating a snow house depends on whether you're going to have fire and do your cooking inside the snow house, or whether you wall up the end of the entrance and cook outside. If you cook outside, a small hole through the side of the snow house opposite the entrance tunnel will provide sufficient ventilation. However, if the snow house is large enough to cook in without danger of setting your clothes or sleeping bag on fire, you must have a ventilating system which will enable you to remove the carbon monoxide gas generated by the stove. There is a vent system you can use. It is based on two facts - one, that the air inside the snow house is much warmer than the outer air, and the other, that carbon monoxide is a heavy gas and will fall to the floor of the snow house as it is generated. Two holes are therefore needed to get the CO_2 out of the snow house - one entering the house at the lowest part of the floor and running vertically up through the wall of the snow house like the chimney of a fireplace, and the second starting as low as possible at the outside of the snow house, running at a very steep angle from the outside upward to the inside, and hitting the inside of the house a couple of feet above the floor. Using this system, you can cover up the entrance tunnel to your snow house and burn a gasoline stove with no danger of carbon monoxide poisoning.

The diameter of the holes will depend on the instrument you use to make them. Any type of pole or piece of metal that can be pushed through the snow can be used. If you are on a heavy bomber that carries a long handled shovel, just force the shovel handle through the snow to make the vent holes. On another type of plane, improvise something from your airplane or emergency equipment. Life raft oars and mast sections, for example, will do fine. Clear out vent holes from time to time to prevent drifting snow from blocking them.

Using the Shelter

After your shelter is constructed, use it - not only for yourself, but for your belongings as well. Snow is the greatest thief in the Arctic. If you leave any of your equipment out in the snow, it may well be

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

buried or blown away. Keep your emergency equipment and extra clothes neatly arranged in your shelter. This will not only make it easier for you to find what you want quickly but will keep you from bumping into things and knocking them over when you crawl into your shelter.

Brush snow off your clothes and footgear before you enter your shelter. Inside, the snow will melt and you will find it quite difficult to dry your things. Whenever you leave your shelter,cover over the entrance for the same reason. Set up a pole of some sort to mark it in case snow drifts over it. Unless it's impossible to secure insulation, never place your sleeping bag on the bare ground or the ice. Always place something under your bedding; if nothing else, snow will provide a good insulation. Normally, however, you will be able to improvise some other insulation readily. You can use parachute seat cushions or even an inverted and inflated rubber life raft as a mattress. Other insulation materials from the airplane are seat cushions, snowshoes from the emergency kit, or cardboard from the rations boxes. In a snow hole or snow house, place a tarpaulin under your sleeping bag to prevent its getting wet from the melted snow running down along the wall.

In wooded country or in grasslands you can find natural insulating materials. On the polar tundra, dry reindeer lichen, shrubs, or dry grass are effective insulating and mattress materials. In timbered areas, evergreen boughs can be used. Twigs and small branches of trees are especially suitable for mattresses because they are springy and soft. Twigs and needles of evergreen boughs are preferable to twigs from broad-leaved trees. Your mattress can be as thick as your time and materials permit.

Usually a close, well-laid, bough bed a foot thick is adequate for all conditions. However, if the twigs are very bushy and springy, a much thinner bed will do. Areas in contact with pressure points of your body should be well padded. Bough beds that have been slept on for many nights gradually lose their resilience and need to be re-laid or replenished with fresh boughs. Tuck the stubs of fresh twigs into the old bed, laying them shingle-fashion. Peg or fit logs three or more inches in diameter at the side of the bough bed. This helps to keep the boughs in place and checks a restless sleeper who otherwise might roll into the fire. It also keeps the bed in shape by preventing men from walking or tripping on the boughs.

THE INTEGRITY OF THE SOVIET MAN IN THEORY-AND IN FACT

Soviet propaganda professes that the alchemy of the Bolshevik Party and Soviet socialist society has produced a morally superior type of man--a "Soviet man". The requirements of internal discipline and control, however, frequently force Soviet officials to publicize unvarnished facts which are at variance with the idealized portrait of the "Soviet man." Numerous Soviet press accounts of actual shortcomings on the part of its people and exhortations to change their ways offer ample evidence that the Soviet man, like other members of the human race, can also succumb to various malpractices such as embezzlement, graft, etc.

Graft, embezzlement, theft, etc., are obviously not the peculiar curse of any particular nation or group of peoples. Soviet propaganda, however, professes that these and other human failings have become but memories in the USSR, the land which allegedly provides the perfect milieu for evolving the perfect man. Chauvinistic eulogies in the Soviet press proclaim the superiority of the "Soviet man," whose averred superhuman attributes are said to be a product of the Bolshevik Party's careful nurture. The following passages, typical of Soviet writings on this theme, would be amusing if they were not a reflection of a chauvinism which blocks understanding among peoples and leads to imperialism.

"Among all the great achievements of socialism with which our country astonishes the peoples of the world, the greatest and most brilliant attainment of the Bolshevik Party and Soviet power is the great Soviet people, a working people, a militant people, a creative people, a people who in war and peace do not consider themselves equalled on our old planet."

"In literature and on the stage we must show the Soviet man — the builder of the future — in such a light that the audience and the whole world will see the moral and spiritual superiority of people who have been reared in a socialist society. It is the moral and ideological superiority of our people which makes our representatives superior to all others in the world tribunal."

The proper subordination of selfish personal interests to the common good is presented as major evidence of this remarkable transmutation of the former human being living in the Russian Empire into the "Soviet man." According to the late Andrei Zhdanov, "the Soviet people have become accustomed to place the public, state interest before everything. They have become accustomed to consider the common concern as a vital personal matter."

Yet the Soviet press itself, from its frequent reports of fraudulent practices, offers ample proof that the Soviet man continues to share bad as well as good instincts and habits with other members of the human race. Soviet propaganda regarding the alchemy of the Soviet environment which has created the faultless man invites attention to the numerous proofs of its falsity. A recital of some of the published Soviet accounts of dishonesty among Soviet citizens is not intended to convey the idea that the Soviet peo-

THIS PAGE IS UNCLASSIFIED

ple have a monopoly on the described moral faults but is offered as merely an antidote.

That embezzlement and a multitude of other dishonest practices present a serious problem to the Soviet authorities is made evident by repeated complaints of the Soviet Prosecutor-General that his staff is not sufficiently diligent in bringing culprits to justice, and by exhortations to strengthen the fight against the plundering of state and private property.

It appears that the illegal use of socialized property is most common on collective farms, since public appeals to "liquidate fraudulence" on collective farms are so frequent. The government's postwar drive against these abuses was formally marked by the issuance on September 19, 1946 of the decree "On Measures for the Liquidation of the Violations of the Collective Farm Charter." The gravity of the situation was indicated by an announcement that in the year following the decree 1.3 million hectares (3.1 million acres) were returned to collective farms from illegal holdings of individuals. Three years later, however, misappropriation of collective farm lands and other property continues apace. A series of recent reports from the Ukraine and other localities indicate that the problem remains acute. Pravda Ukrainy's lead article of July 12, 1949, headlined "We Must Resolutely Abolish Violations of the Collective Farm Charter," decries malpractices which are common on many Ukrainian collective farms: the embezzlement of public lands, which are then cultivated for private profit; the stealing of collective farm property and monies; and the squandering of cattle.

One report describes in detail the pilfering by a chairman of a collective farm in Saratov Oblast (RSFSR):

> "Five years ago when he became chairman of the collective farm there were 227 sheep on the farm. During the period of his management the number was reduced to 83. In these years Dementev built a home in Balshov where he established his own sheep stable and bought a cow with 14 of the sheep. He did not begrudge collective farm property for either himself or his friends. In 1947 he distributed 400 truck-loads of rye straw; in 1948 he squandered 2 tons of bread and 90 poods (3,240 pounds) of hay. Dementev not only stole from the common storehouse but also from the collective farm cash fund — he appropriated for himself about 10,000 rubles which had been earmarked for distribution to the collective farmers. When he needed additional money he cut down a wooded area which extended for three kilometers and which served as a windbreak for the fields."

The Machine Tractor Stations (MTS), which provided collective farms with mechanical power, have also lately come in for sharp criticism for improper utilization of public resources. An order of July 9, 1949 issued by the Ministry of Agriculture deplores the squandering and embezzlement of fuel in the MTS of Kuibyshev Oblast. In 1948 about 200 tons of petroleum products were embezzled in this oblast. This year one of the directors of an MTS, Shcherbakov, "squandered to various organizations and persons 2,600 kilograms of petroleum products and permitted the theft and loss of 1,000 kilos of gasoline. In order to hide the squandering and theft of these products, Shcherbakov added transportation and tractor work not accomplished by the MTS and illegally reported the use of more than 2,000 kilos of petroleum products for these tasks. The order directs that similar misdeeds must be ferreted out and the wrongdoers brought to stern justice.

Illegal spending of state funds and falsification of accounts permeates the industrial front as well. In Chelyabinsk Oblast, for example, there were 1,000 cases of what is euphemistically referred to as "violations of financial discipline." A director of one enterprise spent more than 59,000 rubles from the

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

wage fund. Other executives, such as the director of Moskvych automobile factory, fake plant output reports to cover up underfulfillment of plan.

Leningradskaya Pravda of January 26, 1949 exposes a group of engineers and technical workers who misappropriated large sums of state funds in 1945-46. They concluded agreements with plants for various types of work for which they fraudulently inflated the cost. Cash reserves which were accumulated by this method were divided among the group. They were also guilty of drawing up fictitious trade agreements and forging signatures.

Social insurance funds have proved no more immune to plunder. An extensive investigation in 1947 and 1948 turned up evidence of gross misuse of funds allocated for workers' benefits. As a consequence, Gurbunov, head of the social insurance division, and Khokhlachev, chief bookkeeper, were dismissed from their posts. Often sums assigned for special diets for sick workers were illegally spent on the arrangement of evening parties, the feeding of delegates to conferences, etc. Trade-unions were accused of financing vacation resort trips for their officials out of social insurance funds. According to Soviet reports, the case of the official who spent 6,000 rubles of social insurance funds on a 38-day spree is not at all uncommon.

In the face of accounts of plagarism and slanderous accusations made for personal advantage, it becomes even more difficult to understand what the Soviets mean by the alleged lofty moral superiority of Soviet man. Pravda of September 5, 1949, for instance, reports on one Druzhinin, who claimed as his own a poem which had been written by another. Particularly conscienceless behavior was displayed by an official of a publishing house who brought out under his own name a book which had been submitted to him for approval by the author who shortly thereafter was called to the fighting front. Anna Vasilieva's case provides an example of false accusation. Although violating no law she was condemned by a court following a campaign of persecution and slanderous accusations made by her superior. The latter initiated the campaign when Vasilieva rightfully refused the use of state lumber for building a fence for her superior's dacha. It was only when the case reached the Supreme Court, after 17 months of wending its way through channels, that the truth was ascertained and Vasilieva cleared of malicious charges.

In the words of S. Kovalev, a Soviet writer, "there are still a good many Soviet people who maneuver to establish their own prosperity at the cost of other members of society."
Soviet Affairs Notes 16 Sept 49 Rest

The Air Force program of standardization of air target materials, including air objective folders and target dossiers, is set forth in AFR 200-25, 13 December 1949. The standards for materials used in the planning, briefing and training of all types of air operation is established therein. A direct result of this standardization is familiarity and uniformity throughout the services and will in turn permit an interchange of personnel and ease the supply problem...Read AFR 200-25, 13 December 1949.

AIR FORCE LETTER)
NO. 205-25)

DEPARTMENT OF THE AIR FORCE
WASHINGTON, 30 MARCH 1949

SECURITY

Disclosure of Classified Information to Reserve Forces Personnel

(Effective until 30 September 1950 unless sooner rescinded or superseded.)

	Paragraph
Purpose	1
Scope	2
Policy	3
Investigation and Clearance	4
Residents of Foreign Countries and Foreign Nationals	5
Requirements	6

1. Purpose. To provide uniformity, this Letter outlines the policy of the Air Force with respect to the dissemination of classified military information to Reserve Forces personnel.

2. Scope. This Letter applies to the Air Force Reserve and the Air National Guard, and in addition, its provisions will be followed in connection with activities concerning the Air Reserve Officers' Training Corps and the Senior Division of the Civil Air Patrol. This Letter does not apply, however, to personnel on extended active duty.

3. Policy. In compliance with the provisions of AFR 205-1 regarding security of military information, Reserve Forces personnel may be entrusted with classified information as follows:

a. RESTRICTED information may be disseminated for official military purposes to any Reserve Forces personnel.

b. Except as authorized in c below, information classified no higher than CONFIDENTIAL may be disclosed to Reserve Forces personnel not on active duty who are actively participating in official training activities, provided that possession of the information is essential to the training course or program.

c. SECRET information may be disclosed to Reserve Forces personnel on active duty for training purposes and personnel not on active duty who have a mobilization assignment, provided that possession of the information is necessary in the performance of official assigned duties.

d. TOP SECRET material will not be used for training purposes in connection with Reserve Forces training programs. As authorized by paragraph 7, AFR 205-1, 14 March 1949, however, individuals serving on short periods of active duty whose assignments require it may be given access to the TOP SECRET information essential for the performance of their assigned duties.

e. Documents containing information classified higher than RESTRICTED will not be disseminated for retention by individuals. Such documents will be stored in military files only.

f. Reserve Forces personnel not on active duty who receive classified information will be informed that the information affects the National defense of the United States within the meaning of the Espionage Laws and that its revelation or transmission to an unauthorized person is prohibited.

g. Upon termination of active duty training, personnel will be briefed on the necessity for maintaining security of their professional knowledge while on inactive status.

4. Investigation and Clearance. Commanders concerned are responsible for requesting personnel security investigations and clearing personnel referred to in this Letter whenever required or necessary in accordance with separate Regulations.

5. Residents of Foreign Countries and Foreign Nationals. The provisions of AFL 182-4 and 8f, AFR 205-1, 14 March 1949, will be observed regarding dissemination of military information to persons residing in foreign countries, or to foreign nationals as defined in paragraph 2i, AFR 205-1.

6. Requirements. Although it is the desire of the Air Force to make available to Reserve Forces personnel such classified information as is required for training purposes within established training programs and courses, it is of primary concern that no breach of security will result from this policy. Commanders concerned will review continuously all classified material required by or of direct value to Reserve Forces activities, and whenever appropriate, will initiate down-grading action thereon in accordance with paragraph 27, AFR 205-1, 14 March 1949.

BY ORDER OF THE SECRETARY OF THE AIR FORCE:

- - - - -

*This Letter supersedes AFL 205-25 (formerly 46-7), 31 March 1948.
This Letter has been coordinated with and approved by the Chief, National Guard Bureau, as being applicable to the Air National Guard.

NAVY GETS TURBOPROP ENGINE

The Navy and the Allison Division of General Motors took the wraps off the new XT-40 turboprop engine which will power the XP5Y-1 seaplane and other large Navy planes of the future.

The engine is simply two small turbojet units with drive shafts extending forward to a common gear box and driving counter-rotating propellers. The new engine is smaller than the standard J-35 jet used in the FJ-1. Since its energy goes mainly into turning propellers, its power is reckoned at 5500 horsepower. Its exhaust thrust, although present, produces only 10 percent of its total power.

The XT-40 produces two horsepower per pound of weight and is the most powerful propeller-type engine ever cleared for flight. Through its gearing, the engine can utilize both jet units for take-off, and cruising is done on one unit for fuel economy. Conventional reciprocating engines of World War II weighed about a pound per horsepower, double that of the XT-40.

By operating on jet fuel and outperforming engines requiring high octane leaded gasoline, the XT-40 simplifies the supply problem for aircraft. Using extension shafting to drive propellers is not a new idea. Allison used it during the war in the Bell P-39 and P-63 fighter planes which were powered by reciprocating engines located in the rear of the fuselage.

Use of this shafting permits location of the engines at the point most favorable for airplane design and still allows location of propellers at the point where they can contribute most to airplane performance.

The Consolidated Vultee XP5Y-1 has been completed at San Diego and installation of the XT-40 engines soon will enable it to make its first flights.

AIR INTELLIGENCE Review

This "Review" is published for three reasons:
1. To provide timely data regarding new techniques, practices and general information whereby intelligence personnel can maintain proficiency.
2. To provide material which will afford all personnel an appreciation of the intelligence role.
3. To provide a medium whereby all intelligence personnel and activities may exchange viewpoints, problems and solutions.

Two types of material are solicited for publication:
1. Stories and pictures relating to the intelligence activities being conducted within an organization.
2. Original articles of a nonsontrovessial but informative nature.

Material submitted must include sources utilized and the authors name, rank and present military affiliation. Mail stories to: The Editor, "Air Intelligence Review," ConAC, Mitchel Air Force Base, New York.

SOVIET AIR POWER

AN ADAPTATION OF AN ARTICLE BY ASHER LEE

The Soviet Union deservedly holds the blue ribbon for inaccessibility. Her highly developed system of secrecy is worth many fighter squadrons and antiaircraft guns to Air Marshal Constantin Vershinin, who is head of the Soviet Air Force and who plans the air defense of Russia. But in spite of Soviet Security, intensive research and study over the years permit the specialist to assess, within reason, the strength, organization, and fighting value of Russia's air squadrons; not with complete accuracy, of course, but that is no more possible in Moscow than in London or Washington. No one can predict the date or the climatic conditions in which Soviet air squadrons may have to do battle. Nearly all air weapons are today in the melting pot. Except for a few American six-jet planes, the long-ranged jet bomber isn't yet an operational reality. Flying faster than sound has been achieved experimentally; but not for two or three years will supersonic flight be a serious military factor. Radio and radar-controlled antiaircraft shells and rockets may or may not revolutionize air defense in the next few years. The atomic bomb is untested against effective air opposition. Its hitting power may be further reduced by defensive dispersal and underground factories. The range of military rockets of the V2 type, their degree of accuracy, and their explosive potential are as much a subject for scientific conjecture on Soviet rocket ranges near Irkutsk as on America's White Sands.

One thing must be said at once about the Soviet Air Force of today. It has benefited enormously in the last four or five years from the contributions of German scientists,

The Russians are progressing in the field of long-range jet bombers.

1710

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

technicians, and tacticians. Vast strides have been made in almost every field of aviation. In mobility, in the design of its jet-engines, in the improvement of its aviation fuel, in the manufacture and use of radar equipment, and in the development of rockets, German influence is predominant. We can accept the published testimony of Colonel Grigori A. Tokaev that the Soviet Air Force scientific legacy from the Luftwaffe in 1945 was considerable. Equipment from dozens of Germany's aircraft factories and experimental air stations was heaped on the Kremlin's eager lap.

In World War II one of the greatest of the Soviet air weaknesses was the absence of any kind of radar equipment in operational aircraft. It is not surprising that three American Superfortresses which force-landed in Siberia at the end of the war, were pounced upon and retained by the Soviet as war booty. Valuable radar bombing equipment was aboard.

The operational use of radar is one of the keys to modern long-range bombing. Heed should be given to Britain's Air Chief Marshal Arthur Harris on this point. In his book Bomber Offensive, he writes: "Unless an effective nonvisual (radar) navigational aid is provided, the task of the night bomber isimmensely difficult." It is a fact that all Soviet long-range bombing of Germany in World War II was done at night without the use of radar. There should be no surprise that it proved to be second-rate and ineffective. The USSR never used more than 250 long-range bombers on any of these operations. Three-quarters of the bomb loads were usually wide of the target area. There are thousands of German Air Force prisoners and German emigre factory workers in the U.S.S.R. who now are helping to remedy this state of affairs. There are German radar technicians lecturing and expounding at the aviation schools at Frunze, Novosibirsk, Sverdlovsk, Khabarovsk, Baku, and elsewhere. The U.S.S.R. also has the use of thousands of German radar workers from the Siemens Telefunken and Askania factories working in Leningrad, Kuibischev, and Kiev. In the next few years, these Germans may atone for some, but not all, of the Soviet ignorance of the use of radar in war.

The Germans not only bequeathed their radar equipment and technicians to the U.S.S.R. The Soviet have also acquired the secrets of a whole range of Nazi radio-controlled bombs and rockets which they are now exploiting. There are the Henschel radio bombs that the Germans used against Atlantic convoys and in the Salerno operations off Italy in 1943. These bombs were still in the experimental stage during World War II. The Germans pressed them prematurely into operations, but the Russians have had time to develop them at leisure. The same story of German legacy is to be told about radar-controlled and antiaircraft rockets, such as the Henschal V3 projectile. In fact, any future opponents of the Soviet Air Force may have to reckon with the whole gamut of Luftwaffe scientific weapons.

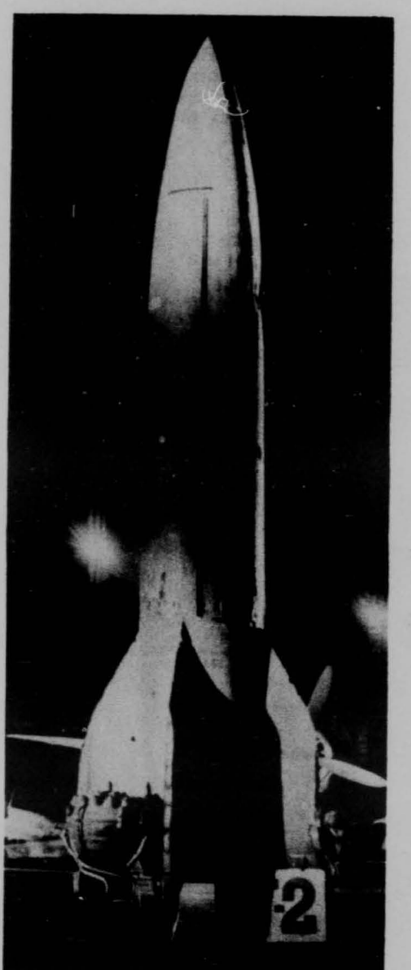
However, long before the Soviet Union gained possession of the German flying bomb (V1) and the long-range rocket (V2), Russian technicians had been working on their own domestic models of these air weapons. The doyen of Soviet rocket scientists is Constantin Ziolkowsky. With his colleagues Rynin, Perelman, Petrovitch, and Schershevsky, he was making large fuel rockets at the Soviet ZAGI research centers at Moscow, Leningrad, and Kazan, in the

1711

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED



GERMAN V-2 LONG RANGE ROCKET
Gaining possession of this and other type guided missiles spurred Russian advances in this field.

1928-30 period. ZAGI is the central organization for Soviet air design, production, and experimentation. In the 1930's, the Soviet acquired some refugee workers from Germany's chief rocket center at Pennemunde. Most notable was Herman Oberth. Stalin failed to realize, however, that heavy rockets were to become a major weapon of war. He concentrated on developing a small rocket projectile used with moderate success on his fighter planes throughout World War II. The Soviet flying bomb was a failure. In the last three or four years Russia has been catching up. The Soviets have already improved on the performance of Nazi rockets and flying bombs. Of the two weapons, the rockets are likely to be developed most--especially for use from the increasing number of new Soviet long-range submarines. But the range of Russian heavy rockets delivering a ton of explosives will not exceed about 500 miles for a year or so. Nor will they exceed 1,000 miles in the foreseeable future. Soviet metallurgists and radio-control experts have the same problems to solve as those of other countries. Rocket cases get hot. Fuel takes up a lot of room and adds weight. The difficulties of radio-controlling large missiles traveling at over 3,000 miles an hour are far from solution. In fact, really effective long-range military rockets are at the moment beyond current scientific knowledge.

Numerically, the Soviet Air Force is smaller than at the end of World War II. It has a personnel strength of about half a million, but that is only the total of the men and women in uniform. There are, of course, thousands of civilian helpers--test pilots, cooks, clerks, and the like. Fromthe peak war operational strength of about 22,000 planes, split up into about 650 air regiments, each

1712

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

with a strength of thirty to thirty-five planes, the Russian Air Force is down to about 15,000 planes and about 500 air regiments. This reduction is not to be interpreted as a disarmament gesture. It is simply the slow-down effect of building larger and more modern planes in the last three years. The war-time monthly peak production of 2,500 to 3,000 military planes, excluding trainers and production in the satellite countries, is down to about 2,000 to 2,500 a month. But this smaller Soviet Air Force has much greater hitting power and is a much better instrument of air defense than the rather clumsy machine which enjoyed air domination against a much weakened Luftwaffe on the Eastern Front during the last two years of World War II.

The Soviet Air Force made extraordinary progress during the second World War. When it had to go to war with Germany in the summer of 1941, it was, on the whole, a second-rate fighting machine. Large numbers of its fighters were obsolescent and

Air Army Commanders have their headquarters at Odessa, Minsk, Leningrad, Tashkent, Chita, and Tiflis (Tbilisi).

had top speeds of little more than 300 miles per hour. Many of its bombers lacked the protection of adequate gunnery and armor plating. The standard of blind flying was low. There was a general lack of mobility fatal to an air force largely designed for tactical continental air warfare over vast European spaces. During the war, things improved rapidly. By 1944 Soviet designers Lavochkin, Mikoyan, Gurevich, and Yakovlev were turning out fighter planes almost as good as the Focke Wulfs and Messerschmitts, Spitfires and Tempests, or Thunderbolts and Mustangs. Soviet cannon-firing fighters with top speeds of 375 miles an hour were the rule rather than the exception in the Soviet Air Force of 1945. Soviet twin-engined planes designed by Ilyushin and Petlyakov had also become modernized and were then comparable in performance with their German opposite numbers. Large-scale production of American Dakota transport planes was in full swing at Moscow and Tashkent. Production of four-engined heavy bombers, which had been slowed up between 1941 and 1944, resumed at the prewar rhythm during the last year of the war in Moscow and Kazan. In addition, Soviet Air Force radio communications and the supply organizations were vastly improved.

But when the end of the war came, the Soviet Air Force was lacking in many operational respects. It had never been pitted for long against a modern air force of approximately its own size. The Soviet Air Force had gained no experience of operating radar equipment, jet-propelled planes, large rockets, radio-controlled bombs, or aircraft carriers. It had shown the world little of the hitting power of its long-range bomber force reformed in the Spring of 1942 under General Golovanov's command and Stalin's particular patronage. The Soviet air defense system had hardly been tested, for

The U.S.S.R. B-29, probable Soviet designation TU-4, is a four-engine, low-wing bomber. This aircraft is apparently an identical copy of the U.S. B-29 Superfortress, several examples of which were confiscated by the Soviets after being forced to land in Soviet occupied territory before the end of the war. From the captured B-29's the Soviets have also produced a 72 seat pressurized passenger transport designated the TU-70. The redesign of the B-29 was produced by the versatile Andrei Tupolev, co-founder of the U.S.S.R. aviation industry.

SPAN: 141' 3"
ENGINE: Ash-90; radial/2200 hp
SPEED: 320 knots/30,000 ft.
RANGE: 3925 nautical miles/195 kn
ARMAMENT: 11 x 12.7 mm.
LENGTH: 99' 0"

RESTRICTED

1715

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

the Luftwaffe was never able to launch a full-scale attack on Soviet cities. The German raids on Moscow in the summer of 1941 were modest in size, averaging about seventy-five planes per attack, and they petered out after half-a-dozen operations.

The Soviet Air Force today consists of air force units, airport ground service units, signal units, air bases, and meteorological service. According to its assignment, the air force units are divided into fighter, dive-bomber, bomber, reconnaissance, artillery-liaison communications, transport, and medical elements. As in the United States, the Soviet Air Force is a separate branch of the armed services equal to the Army and Navy. For administrative purposes, the Soviet Air Force is subdivided into two functional branches: the Military Air Force (for cooperation with ground troops) and a relatively small Long-Range Air Force.

The Air Force of the Soviet Union is organized into air armies, each being composed of three corps, further subdivided into three divisions per corps. Each air division comprises three air regiments, three squadrons per regiment.

The air armies are under direct authority of the Red Army Commanders, who have their headquarters at Odessa, Minsk, Leningrad, Tiflis, Tashkent, and Chita. The Soviet Long-Range Commander-in-Chief is General Golovanov. Both Long-Range and Military Air Forces are directly controlled by Marshal Constantin Vershinin.

Over two-thirds of the 14,000 aircraft (400,000 personnel) in units are organized into over a dozen tactical air armies of about 1,000 aircraft each. Of these 14,000 operational aircraft there are several hundred jet fighters and some 300 B-29 type bombers.

The Naval air components of the Soviet Navy consist primarily of shore based aircraft as well as seaplanes and flying-boats. These components are administered by the respective naval commands. The naval air components are organized in naval air divisions and naval air regiments in the same way as the Military Air Force. The role of the naval components in World War II was primarily in operations supporting the ground forces and protecting naval shore installations. They are now engaged in training for naval escort duty, anti-shipping operations, and mine-laying and sea reconnaissance. There are no aircraft carriers.

Soviet transport planes number about 3,000. This figure includes the civil air lines. These need to be taken into the military account because they could and would be quickly integrated with the military transport units, some of which are also part of the Long-Range Bomber Command. The war-time twin-engined P.S. 84, the Soviet version of the Dakota, is being replaced by the more powerful twin-engined Ilyushin 12. In addition, Ilyushin is building a heavier four-engined transport plane and there is a transport version of Tupolev's four-engined bomber, the TU-70.

In the bomber field the current Soviet long-range plane is the TU-4, apparently an identical copy of the U.S. B-29 Superfortress.

Soviet aircraft and engines are designated by an abbreviation of the designer or designing committee, followed by a number which is not always in the correct chronological

THIS PAGE IS UNCLASSIFIED

The IL-12 is a twin-engine, low-wing monoplane transport. The wing has positive dihedral; and its center section is rectangular while the outer sections are trapezoidal with rounded tips. Single tailed, it has a retractable tricycle landing gear. The main wheels are dual and the nose wheel is single. The IL-12 has a capacity of 27 passengers or 19 paratroops. Designed by Ilyushin, the plane is similar to the C-47, but the IL-12 wing is placed farther aft than the C-47. First public appearance of the IL-12 was at Tushino Airport, Moscow, on August 18, 1946.

SPAN: 104' 0"
ENGINE: Ash-82; radial/1680 hp
SPEED: 220 knots/8800 ft.
RANGE: 1080 nautical miles/164 kn
ARMAMENT: None
LENGTH: 69' 10"

order. An obvious example is the Yak-3 which was developed from the Yak-9, both designed by Alexander Yakovlev, one of U.S.S.R.'s foremost aeronautical engineers.

Soviet jet-fighters and fighter-bombers have been replacing the wartime conventional fighter planes in Air Force units since 1946. Svetzov, chief Soviet jet-engine designer, has been working on jet-engines since before the German war, but by the summer of 1945 the U.S.S.R. was still without its first jet fighter squadron. Then came the German windfalls. Hundreds of Junkers 004 and B.M.W. 003 jet-engines were acquired in 1945 from the Junkers Dessau factories and the aero-engine plants in Austria, Czechoslovakia, and Hungary. The Luftwaffe abandoned to the Soviet Air Forces dozens of samples of the single-jet Heinkel 162, the twin-

THIS PAGE IS UNCLASSIFIED

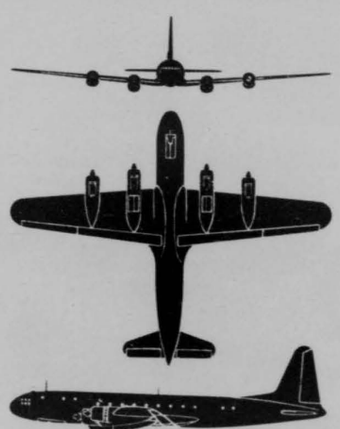
The IL-18 is a four-engine, low-wing transport. The fuselage is cigar-shaped with no prominent windshield. The wing root is faired into the fuselage with the fairing extending aft of the trailing edge of the wing. The wing tapers on the leading and the trailing edge to relatively narrow chord wing tips. There is a single tail. It is fitted with a retractable tricycle landing gear with dual wheels. The IL-18 has a 66 passenger capacity with crew of 6. Superficially the IL-18 resembles the British Avro Tudor 7 and is evidently a scaled-up model of the Soviet twin-engine transport, the IL-12.



SPAN: 131' 0"
ENGINE: Ash-82 FNW;radial/1825 hp
SPEED: 270 knots/20,000 ft.
RANGE: 2000 nautical mi/175 kn
ARMAMENT: None
LENGTH: 100' 0"

jet Messerschmitt 262, and the two-jet Arado 234. Long before the first fifty British Rolls-Royce jet engines arrived in the U.S.S.R. in 1946, the Soviets were flying their own Yak and Mig jet planes. Today they have between 1,500 and 2,000 jets in squadrons. The Soviet fighters have 30 and 37-mm cannon, against the more general British 20-mm gun, but their engines lack the power and speed of the latest types of British Meteor and Vampire. Most Soviet jet-engines in service have a static thrust of about 4,000 lbs., though engines of about 5,000 lbs thrust will shortly be in squadron service.

And what about the men behind the planes? What about the human factors of morale, training, and leadership?

The morale of the Soviet Air Force is currently high. It gained great

cheese, and chocolate at main meals; there are also special Air Force holiday centers. On the whole, a healthy atmosphere exists in the Soviet Air Force engendered by healthy grumbling about aircraft and senior officers, by a blind passion for flying, and by a devoted patriotism to their country.

Basically, training in the Soviet Air Force is run on sound lines. In the holocaust of defeat and withdrawal in the summer of 1941, there were chaotic phases. Flying instructors were sent to the front-lines. There was a shortage of planes in the schools, particularly for the vital later operational stages of training. But the Soviet got over that and they are now back to peace-time schedules. Luxury training standards can be indulged in once again. Young Soviet hopefuls begin at the aero clubs (there are over 500 in the U.S.S.R.). Some of the smaller ones have only about ten old-fashioned biplane trainers with perhaps half-a-dozen flying instructors. But the larger clubs at Leningrad, Moscow, Kiev, Kuibischev, Irkutsk, Tashkent, and elsewhere run to twenty or thirty modern planes with one instructor per machine. They pick out promising boys and girls at school and give them basic technical training, elementary navigation, and a bit of flying. These clubs have over 100,000 young aspiring pilots using their facilities.

The next stage is military flying proper. Soviet citizens are selected for the Air Force during their period of military conscription, which has been, of course, a non-stop feature of Soviet life ever since the 1917 revolution. Air

Force personnel are usually the elite. The basic military flying training takes about two years. The first three months are spent in marching, drilling, handling guns, physical training, and a fairly hefty dose of political instruction. The inevitable lectures on theories of flight, air navigation, aircraft instruments, map reading—all are there. A written and oral examination follows. The following year or so is devoted to circuits and bumps, and short cross-country flights with the air instructor at this stage guessing whether his protege shows more promise as a bomber or as a fighter pilot. When this decision has been made the young pilot receives his wings and is ordered to bomber, fighter, or reconnaissance school.

If one had to select a point of major interest in the Soviet air training system it would be the merging of the small wartime specialist bomber, fighter, and reconnaissance schools into giant training centers each of which accomodates several thousand pupils. Here Soviet air gunners, fighter pilots, and radio operators are trained in one big communal flying camp. Flight mechanics, army support specialists, and bombardier-observers rub shoulders in the same mess huts. This makes a fine breeding ground for the exchange of ideas. It generates flexibility, camaraderie, and sympathy between bomber, fighter, and reconnaissance crews. Apart from that, these combined training centers are more economical to run than a large number of small camps.

Just as you would expect there is a place for women in the Soviet Air Force training schemes. Girls get the same chance as the boys in the aero clubs and the best of them become flying instructors. During the war military training centers for women were set up in the Urals, at Astrakhan and just east of Moscow. Soviet airwomen played a slightly greater role in their country's Air Force annals than women in other countries. They ferried aircraft, worked in aircraft plants, manned AA batteries, did photo interpreting. The exceptional fact is that some of the best female pilots did fly on combat duties—usually on short-range night-bomber operations and as fighter pilots usually in a defensive role, covering Soviet cities and industrial centers. It would be sheer feminist or Stalinist exaggeration to say, however, that they played, are playing, or will play more than a token part in operational flying duties. One per cent of Soviet Air Force combat sorties would more than cover their past or future contribution. On the ground, however, they played and continue to play an important role. With the post-war introduction of radar, Soviet airwomen may become more important in guiding young Ivan's flights, in identifying the approach of hostile planes, and plotting the paths of raids or flights in and out of the U.S.S.R. Most Soviet women, in spite of undoubted emancipation opportunities, want to bring up a family. Military flying is a long way from the home.

The great weaknesses in Soviet air training are in the realms of radar and long-range bombing. In World War II, the Soviet had a very second-rate long-range bomber force led by Air General Golovanov. The transport and close support demands of the Red Army, the lack of sound navigational training, the effective Anglo-American bombing of targets all over Germany, Central Europe, and the Balkans, all contributed to clip Golovanov's long-range wings. Today, Russia's air leaders undoubtedly regret their lack of know-how

Women of the Soviet Air Force grouped in front of Yak-1.

in strategic bombing, and are doing all they can to remedy the situation. Radio Moscow may pour out bogus post war pity for Germany's battered cities just in order to make political capital. Their transmitters may blare out the fairy story that it was the wicked Fortress, Liberator, and Lancaster crews from U.S.A. and Great Britain who vented their barbarian bombing spite on the poor German population. The truth is that Soviet air leaders like Novikov, Gromov, Golovanov, and Vershinin took more than a passive interest during the war in both British and American strategic targets, planes, and bombs.

Who are Russia's air leaders today? In the Politburo Malenkov and Molotov have most influence on air matters at the direction and control level. Stalin is anxious to build a large strategic bomber force and to build large numbers of trans-oceanic rockets on the German blueprint of Dr. Sanger, but the ex-Generalissimo is not well-versed in the difficulties of developing modern air weapons. Vershinin, Chief of the Soviet Air Force, and General Sudets, his chief-of-staff, have a reasonably free hand in developing their own ideas. Colonel Tokaev has published statements on the Soviet Air Force implying that the threat of purges or imprisonment, plus a centralized bureaucracy, handicap the development of the Soviet Air Force. There is little evidence to support this view. Sudets and Vershinin are well aware that the average reign of their predecessors was from one to two years--that Soviet air chiefs like Alksnis, Loktionov, Rychagov, and Novikov lost the Kremlin favour and suffered violent treatment. But Vershinin and Sudets, his chief-of-staff, are full-blooded commanders, and like most Russian airmen, accept the normal operational risks of life in war and peace.

What are their air plans and hopes? Defensively, they must build up the chain of radar stations along the Arctic, Baltic, and Black Sea coasts as well as along the shores of the Far Eastern maritime provinces. As quickly as they can, they are manufacturing and installing these radar stations which will give warning of the height, direction, and numbers of incoming planes. They are practicing and training intensively so that their radar operators can interpret the "blips" in the cathode ray tubes reliably and quickly. But it is a long process which will take several more years to complete. Apart from radar, they will need to stiffen their fighter and antiaircraft defenses. No doubt, when the time comes, many of the fighter regiments at present under tactical command with the Army and Navy, will be switched to a master fighter command responsible for the strategic defense of the U.S.S.R. It is, however, a vast area to defend, and should always be vulnerable to feints and tactical variations by incoming bombers.

1725

THIS PAGE IS UNCLASSIFIED

Offensively, the Soviet Air Force will do well in a tactical role, and it should succeed strategically if it confines itself to night and bad-weather bombing.

In daylight operations, its long-range bombers, unescorted, would be ready victims of jet-fighters provided there was adequate warning of their approach. We cannot assume that the Soviets have no immediate plan for long-range daylight bombardment. Long before air leaders like Generals Arnold and Spaatz laid stress on the future strategic importance of the Arctic air-lanes, Soviet aircraft were making test flights over the North Pole routes. One of Golovanov's long-range bomber divisions specializes in Arctic flying and operates from Siberian bases.

The Air Defense squadrons of the Soviet Air Force are being made as mobile and self-contained as possible. This is partly the Russian answer to the threat of atom bombing, partly the inevitable result of having multi-air fronts in prospect over the Black Sea, Western Europe, the Far East, and the Arctic.

In any final survey of Russia's air power, one inevitably compares it with that of the United States. Although the "Price of Power" (Royal Institute of International Affairs) finds Russian industry more vulnerable to bombing than that of the U.S.A., that is compensated for to some extent by the ignorance outside Russia as to where the vital war factories in the U.S.S.R. are located. Industrial intelligence, as the records show, was a weakness in the war against Germany. It is likely to be an even greater weakness of any power waging war against the U.S.S.R. On the other hand, America has a big technical lead in radio-controlled bombs and rockets, in the development of long-ranged jet-propelled bombers, and in total industrial potential. Both powers are committed to providing air forces for others, but it is likely that this will prove a greater drain on the Soviet than on the U.S.A. Moreover, the forces of the Western Alliance are likely to provide a better operational return and more industrial cooperation than the satellite countries of the Cominform. In the overall manpower situation, Russia and her satellites are likely to provide fewer first-class pilots than the Western Powers. This does not imply that Soviet pilots are not fearless, well trained, and competent—it is simply that the Balkan and Transcaucasian populations are likely to produce less first-class airmen and technicians per million head of population than the inhabitants of Western Europe, North America, and the Commonwealth.

Under no circumstances should the Russian Air Force be regarded lightly. The Russians have shown as great a capacity for successful imitation as did the Japanese. It is well known that they have succeeded in building a formidable strategic air force. It may be that they have mastered the techniques of in-flight refueling and cruise control. It has been noted that they are competent arctic navigators. Their possession of the atomic bomb has changed the entire concept of their long-ranged capability. Tactical air forces have been expanded and brought to a high degree of efficiency. They are currently deployed to act instantly in support of the Red armies. It can be concluded positively that the known power and the predictable potential of the Soviet Air Force make it a factor which must be regarded with the gravest concern.

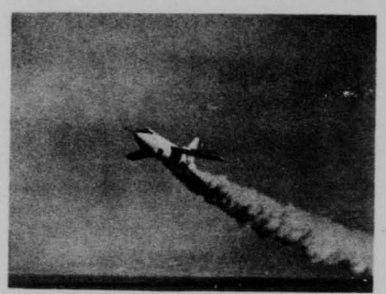
COVER PHOTO



Pictured on the cover is the Navy's new D-558-2 "Skyrocket." Produced by Douglas in cooperation with the Navy and the National Advisory Committee for Aeronautics, it is a jet and rocket powered experimental craft designed for high speed and high altitude testing. (The JATO attachment shown is not an internal part of the plane, but was added in a test to reduce take-off run. The bottles are dropped when the plane is in the air).

The first jet-rocket plane of its type, it can take off under its jet power, climb to high altitude, and cut on its rockets to approach the speed of sound. The jet power is resumed for landing.

The Westinghouse J-34 turbojet engine generates a 3000-lb thrust. The four-unit Reaction Motors rocket engine produces a 15000-lb thrust per unit.

The D-558-2 is designed for greater speeds than its predecessor, the D-558 "Skystreak" which at one time held the world's speed record of 650.6.

Magnesium alloy is used for the greater portion of the fuselage skin. Wing and tail surfaces are 75S aluminum alloy. Aerodynamic brakes are provided on the aft fuselage for drag and speed control. The cockpit is pressurized for high altitude flight, and refrigerated to counteract heat created by the friction at critical speeds.

Air for the turobjet is scooped in by ducts on each side of the fuselage. The plane carries 250 gallons of aviation gasoline (not kerosene) besides liquid rocket fuel.

To protect the pilot, the forward section of the fuselage is jettisonable. In an emergency, the pilot blasts the nose compartment clear; and when his compartment slows down, he parachutes out in a normal fall.

In the centerspread of the 5 March 1950 Issue (Vol. 2, No. 5), captions on the Navy FH-1 Phantom and the F3D-1 Skyknight are reversed. The identity is as pictured above. The Air Intelligence Review appreciates the promptness of the 22nd Bomb Wing, March AFB, in calling attention to this matter.

Lord Tedder ON AIR DEFENSE

This article paraphrases the remarks of Marshal of the Royal Air Force, Lord Arthur William Tedder, G.C.B., in a speech to the Royal Empire Society in London, November 1949.

Lord Tedder, one of the world's leading airmen and a profound student of modern war, considers the problem mainly from Britain's viewpoint. Nonetheless, his views are of interest and importance to everyone concerned with the security of the United States.

Before specifically discussing air defense, the Air Marshal discussed defense as a whole, pointing out the prime fact that in modern days war is total. It is a unity involving every branch of national life. Defense is not merely a matter of guns, ships, and aircraft. Every man and woman in the nation has his or her share in defense. A nation is very much like a boxer. If he is going to fight it is not good enough for him merely to have bulging biceps and knobby knuckles. He has got to be fit all around. First and foremost his morale must be good. Surely everyone would readily accept the fact that high morale is the first principle governing the effectiveness of armed forces. But not everyone realizes that the real key is national morale. The armed forces are, after all, merely that part of the nation whose particular role in national war effort involves them in actual fighting or direct support of fighting units. If the morale of the nation is weak, the morale of the forces will not be high. The strength of Britain has always been in its unshakeable morale—its flat refusal to consider the possibility of defeat. When the Battle of Britain is commemorated each year, the airmen who fought that battle in the air over England, the channel, and the North Sea are rightly honored. Yet one factor no less vital to that victory than the courage and skill of the airman was the unquenchable morale and spirit of the people.

There have been many signs recently that that spirit is as live now as ever it has been. Nevertheless, there is one thing which must be watched carefully. The British are rather proud of talking about "backs to the wall" and "last ditches," and

RESTRICTED

THIS PAGE IS UNCLASSIFIED

it is in one way something for the people to be proud of, that the tougher things look the tougher they become. Complacency, however, is dangerous. During the awful period so appropriately called "the phoney war," it frequently was said that until the nation was honestly frightened it would not really get down to business properly. There is a modicum of truth in that comment. In the last war all the first rounds of the contest were lost; and, in fact, the country was unpleasantly near being knocked out. With modern developments in the techniques of warfare, it must be realized that Britain cannot afford to take such chances again.

In the British press, mention has been made of some public differences of opinion in America between admirals and airmen. Nevertheless, without entering that controversy, this is what one American admiral said:

"It behooves countries whose people, like all free peoples, object to paying for large military establishments, to see to it that they are strong enough to gain the time to turn the spirit and capacity of their subjects into the new activities that war calls for."

Since Admiral Mahan died some years ago, it is trusted that this quoting will not be regarded as any intervention in current controversy on the other side of the Atlantic. That statement is as true now as it was when written;but its application must be adjusted to fit in with modern conditions. There are two main points; firstly the time factor; secondly expense or, preferably, economy.

As regards the last war,providence was very kind to Britain. The country was given considerable warning before the war. It was four years before the Battle of Britain that the Royal Air Force expansion began. Further warning and breathing space resulted from Munich and from the eight months of "phoney war."

Despite all that, the British were overwhelmed in Normandy, in France, in Greece, and in Crete. Those were the days when soldiers and sailors who had passed through hell in those tragic campaigns came home with bitterness against the Air Force—the R.A.F. had let them down. Yet those were also the days when many of the brightest and best had given their lives in the air against hopeless odds, gallantly attempting to help our men on land and at sea. England can only be thankful to providence and those in authority at the time that there were enough left—the few—to hold the fort in the crucial struggle, the Battle of Britain.

What had happened? What was wrong? The position was really quite simple. Once air power had become a real factor in war, as it now had, nothing (whether military, naval or economic) could carry on effectively on land or sea without air superiority. Unless and until command in the air was established, the army and navy were virtually paralyzed. Were the battle for command of air over England to be lost, the whole economic life would be in danger of collapse. In those days the R.A.F. was superior in quality of aircrew and aircraft, but lacked the numbers needed to deal with the overwhelming numbers of the Luftwaffe. Too, there were no secure bases in Norway, France, Greece, or Crete.

People may think this old stuff—Ancient history: We are concerned with the future, not the past; what about "push button warfare"?

1727

THIS PAGE IS UNCLASSIFIED

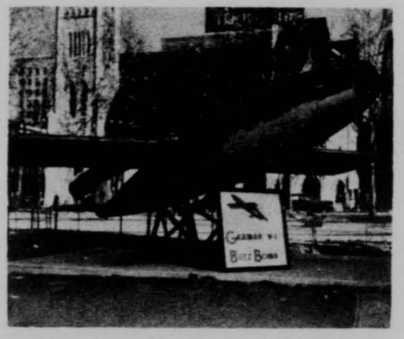
That may come, in some form or another, in the future. But not now or in the immediate future. The principle which was proved again and again in the last war is true now and will remain true for years; and that is, that in war, nothing on the surface of land or sea can operate effectively unless and until the situation in the air is under firm control. This is sometimes expressed by saying that the air battle must first be won. That is rather an over simplification. The air battle is not a matter of hours like a naval battle or of days like a land battle it is a continual fight which continues so long as any enemy bombers can operate. It is often thought that the Battle of Britain took place in August and September of 1940. One phase of it did—the daylight phase over the country—but it continued, first at night over England and then gradually, as first Bomber Command at night and later the American bombers by day, step by step, forced the fight across the Channel, across the Rhine. Finally, it was being fought out over the heart of Germany. There are people who think that air defense is simply a matter of fighters and antiaircraft guns. There is no more dangerous fallacy. One might as well say that because we sometimes call boxing the noble art of self defense that all that a boxer need do is to cover up In the later part of 1944 the Nazis had nearly a million people directly involved in operating their air defense organization—guns, searchlights, radar, and control. They were producing more fighters than the total combined production of Britain and the United States who had to meet worldwide commitments. Yet Allied air superiority over the whole of Germany daily became more and more complete, and systematically the whole war effort of Germany was being paralyzed. No, the Bomber



Against the buzz bomb, the bomber (by bombing the source) was the only effective weapon. We have no better weapon today.

Command attack on Peenemunde which wrecked the V-bomb development and set it back for many months, the attacks on the V-1 sites in North France which delayed the V-1 attack by three or four months, the attacks on transportation in North Europe and West Germany which utterly disorganized the supply of V weapons and enormously reduced the scale of the attacks—these were as much a part of the Battle of Britain as the fighter battles which weaved in the sky over London in September 1940. Moreover, has the fighter or the gun which can deal with the rocket yet been conceived? The bombers dealt with them—and, thus far, alone can do so.

To return to Admiral Mahan's statement, he spoke of being "strong enough to gain the time to turn the spirit and capacity of the subjects into the new activities that war called for." That was all very well in the old days, as when Shakespeare so beautifully described England as

1728

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

"this little world, this precious stone set in the silver sea which serves it in the office of a wall, or as a moat defensive to a house." That moat gave time—time to turn the spirit and capacity of the nation to war fitness. That moat still has its value, but against air attack it means little. The purely passive defense afforded by the Channel covered by the Navy will no more give the time which is needed than did the Maginot Line manned by the French Army in 1940. Yet time must be had. Since no democracy will be an aggressor, it will always be relatively unprepared and must somehow gain time at the outset of a war.

In this connection, however, as in most others, time costs money and, as the admiral so surely remarked, "free peoples object to paying for large military establishments." Moreover, unfortunately, in these days when modern equipment becomes more and more expensive, it becomes more and more difficult to provide forces which will be "strong enough to gain the time." In point of fact, if great care and discrimination are not used it is quite conceivable that a country might spend so much on its "military establishments" as to sap its economic health and so render its military defense quite valueless. Said Lord Tedder: "I do not myself believe that any single democratic country—even the United States—can or will pay for forces which by themselves will suffice to gain the time."

No one will contest the statement that the most immediate and the most dangerous threat would come from the air, and the trouble is that that threat can develop a great intensity so rapidly. The time factor is vital. The inevitable relative unpreparedness of democratic nations has in the past often proved to be an irresistible temptation to an aggressor; and the trouble is that potentialities of a sudden blow from the air are now so great that that temptation may well be even greater than it has been in the past. On the other hand there is ample evidence for the whole world to see that long wars do not pay either victor or vanquished. In other words, while the possibilities of a short blitzkrieg are probably more tempting to an aggressor than ever before, the prospects of a long war are most unappetizing. If, therefore, the free peoples can ensure that they are strong enough to gain time and make it clear to the world that they can defend themselves effectively during the opening phase of a war, the risk of any would-be aggressor trying a blitzkrieg will be greatly reduced. Hence the association of nations now being formed under the Atlantic Pact. By thus combining their efforts the free peoples aim to provide forces which will meet the admiral's requirement, each nation providing for the common pool forces appropriate to its special position and its capabilities. In the past one of the prices of democracy has been a military unpreparedness which only too often has had tragic results. The pooling of resources and collective defense now being organized should provide a combined strength to deter aggression in place of the separate weakness which in the past has invited aggression.

There is just one point on which to comment regarding the Allied Air Forces. It has been suggested a number of times recently that in view of the fact that while the United States has long range bombers and the R.A.F. at present has none, it should be arranged that the R.A.F. concentrate on air defense and a

1729

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

tactical air force, leaving the role of strategic bombing to the American Air Force. "I believe that those who make proposals of this sort have the completely erroneous idea that an air defense force is composed entirely of fighters, and a tactical air force of fighters and fighter bombers. I must plead guilty to having been largely responsible for coining the phrases 'strategic' bombing and 'tactical' bombing," the Air Marshal stated. At that time, in 1943, those titles were valuable in defining two somewhat different roles, but it is feared that recently they have come to be misunderstood and dangerously misused. Because we have called forces which are assigned to the role of strategic bombing "strategic air forces" and those assigned to the tactical role "tactical air forces" it has come to be thought in some quarters that they comprise quite different types of aircraft, different forces.

Actually of course "strategic" is a relative term. What is "strategic" to an army divisional commander is "tactical" to an air force commander and what is "strategic" to an air force commander is probably completely outside the ken of an army commander. People who talk of strategic air forces would say that in the late war Bomber Command and the Eighth Air Force as previously pointed out, played a vital and direct part in the air defense of U.K.: Bomber Command and the Eighth Air Force not only carried out a number of attacks in very close support of the armies but also, for many weeks carried out operations which paralyzed the movement and supply of German forces trying to reach Normandy—"strategic" work from the Army point of view, but "tactical" from the Air Force point of view. These mistaken attempts to draw hard and fast distinctions between strategic and tactical are not merely unsound but actually dangerous. If applied in this way such distinctions would destroy that flexibility which is one of the chief characteristics of air forces, the quality which makes it possible to concentrate air power in a manner quite unattainable by any other force. Nothing could be more dangerous than to weaken that power of concentration. This is particularly true as regards air defense.

Speaking of the air battle, it has been pointed out how inevitable it is that the air battle must come first, and the critical nature of that battle needs no emphasis. The deduction from that is clear the initial job of the R.A.F. as a whole will be air defense. Bomber, fighter/bomber, and fighter, each in accordance with its own particular powers and limitations, will be directed towards the single aim of gaining air superiority, and pushing the air battle away from British skies. The fighter, the fighter/bomber, and the bomber are complementary. An air force without a punch is no force and the punch is the bomber. The noble art of self-defense would mean little if the boxer had no punch. Moreover, let us not forget that it is the bomber that pushes the air battle back from our skies. The less one's own people and one's own land and sea forces see of the air war, the better that war is proceeding. In this last war the air situation was not safe until the air war had moved away from our skies and the Battle of Britain had become the Battle of Berlin. In any possible future war, more than ever would it be vital that the air battle be pushed far from our own skies.

THE BOOK SHELF

RECOMMENDED READING FOR YOUR OFF DUTY HOURS

TITLE: War and Peace Aims of the United Nations
EDITOR: Louise W. Holborn
PUBLISHER: World Peace Foundation, Boston

The first volume under this title was issued in 1943. It was a collection of documents and speeches showing the Allied efforts to define the nature of World War II and the order of postwar society. The present volume now carries the documentation on through the San Francisco Conference and the defeat of the Axis powers in 1945. Most of the documentation is from United States, British, British Dominions, Russian, and United Nations sources. Fifty-two pages pertain to the American republics.

TITLE: A Short History of the Middle East
AUTHOR: George E. Kirk
PUBLISHER: Public Affairs Press, Washington, D. C.

In the modern conception, and as treated in this history, the Middle East comprises the Arabian Peninsula and the Arabic-speaking lands on its northern border; the Arabic-speaking lands of Northeast Africa (Egypt, Anglo-Egyptian Sudan, Cyrenaica, and Tripolitania); Asia Minor; and Iran. The first six chapters of the book bring the history of the area up to World War II. The succeeding chapters deal with the war and postwar years, current economic and social conditions, Russia and the Middle East, and the Western Powers and the Middle East.

TITLE: Strategic Intelligence
AUTHOR: Sherman Kent
PUBLISHER: Princeton University Press, Princeton, N. J.

As considered by this author, intelligence is the knowledge which "our highly placed civilians and military men must have to safeguard the national welfare." At the same time, strategic intelligence is seen as an extension of the search for useful knowledge. The "extensions" which the author visualizes in strategic intelligence are: that the knowledge sought is vital for national survival; that it involves long-range speculation by experts; that its investigations assume a clandestine nature; and that it is a large-scale job, performed by groups and involving a division of labor. The author divides his book into three major parts. First, he considers intelligence as a kind of knowledge. Second, he looks at intelligence as a type of organization which produces knowledge; in this section, he takes up the organizational and administrative problems of central and departmental intelligence. Third, he examines intelligence as the activity pursued by an intelligence organization, covering what intelligence work involves and the problems peculiar to it.

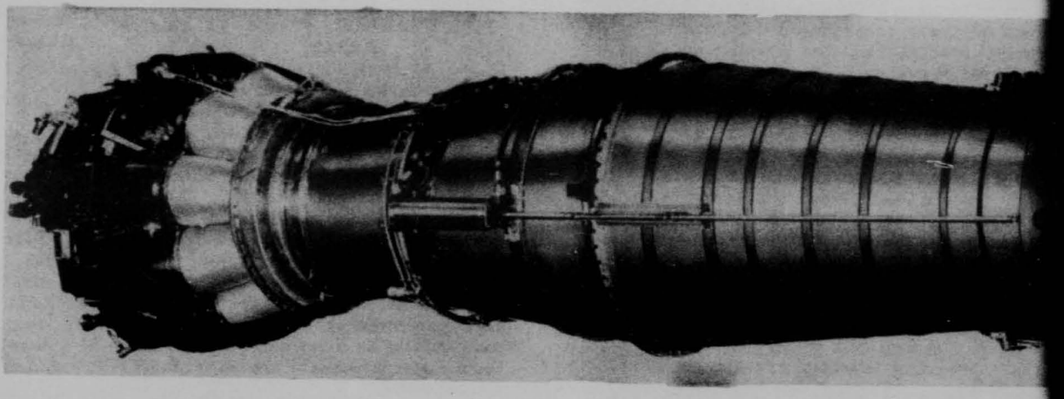
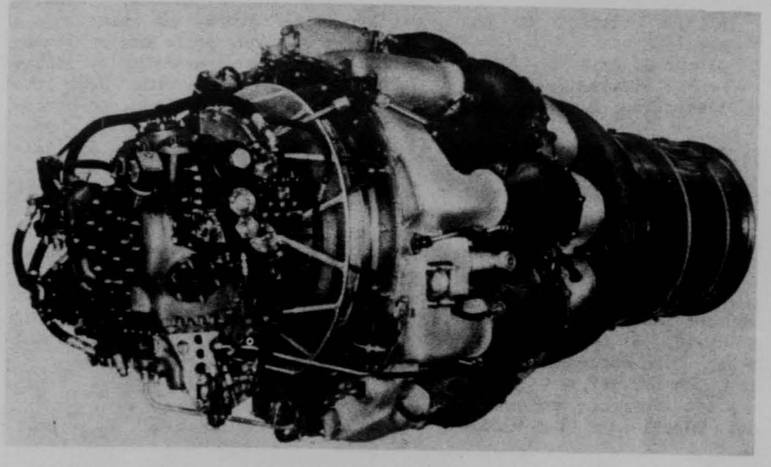
F-93

TODAY'S MOST POWERFUL U.S. JET ENGINE

The most powerful jet engine now operating in the U.S. is Pratt and Whitney's J-48 Turbo-Wasp, developed in collaboration with Rolls-Royce. Developed under the auspices of the Navy, the J-48 is being used in both the Navy's Grumman Panther (F9F-5) and the Air Force's F-93A. With a basic dry rating of 6250 pounds static thrust at sea level, this jet engine provides each plane with approximately 11,000 horsepower.





The J-48 is a centrifugal flow turbojet using a single stage compressor with double faced impeller and double air entry. It will operate on kerosene, gasoline, or special jet fuel. Overall diameter is 50", length 8' 10 3/4", weight less than 2000 lbs. At fighter operating speed, the engine delivers the equivalent of five hp per pound of engine in contrast to one hp per pound in the most powerful piston engines.

Formulation of
UNITED STATES FOREIGN POLICY

Our Armed Forces are important instruments of our foreign policy. Thus the American officer should know something of the principles, processes, and policies which guide our foreign relations. It is with that thought in mind that this article is presented.

HOW HAVE OUR TRADITIONAL POLICIES CHANGED?

Foreign affairs and the foreign policy of the United States are now of paramount concern to every citizen of the United States. The era has passed when this country could count upon self-sufficiency and a remote location to cushion it from the woes and wars of other continents.

Today we are neither remote nor self-sufficient, in the sense that we once were. Transmitted by the many modern communications media, ideas and ideologies cross international boundaries much more freely and more quickly than they did heretofore. Similarly, our technological development has made us dependent on imports for critical raw materials such as manganese for making steel, and upon exports to foreign markets to keep our economy sound. In the military field, modern science has produced weapons which have nullified the cushion of distance once provided by the Arctic wastes and the Atlantic and Pacific oceans.

Thus our traditional policies of isolationism and strict neutrality, outdated by the realities of the modern world, have been abandoned. In their stead we have chosen a collective approach to problems of security and welfare. This new principle of international cooperation is one of great consequence. It has greatly complicated the shaping of our foreign policy. Nowadays, the views of every country concerned must be considered in order to secure the cooperation essential to any effective action. In adopting a basic policy of international cooperation, the United States, because of its strength, has assumed a new and unprecedented position of responsibility and leadership.

THE OFFICERS'S DUAL INTEREST IN FOREIGN POLICY

The pressing foreign relations problem today is that of security. Our involvement in two world wars in this century (and indeed in every major European conflict since 1789) provides ominous indications supporting Mr. Roosevelt's conclusion that, in the world of tomorrow, "peace is indivisible."

The business of our Armed Forces is the security of the United States. They are the cutting edge of foreign policy in war—which is the violent form of policy implementation. They are a supporting arm of foreign policy in peace—providing an element of that strong national posture essential in giving substance to the views and voice of the United States. On this last point Mr. Truman has said:

"If we can make it sufficiently

1734

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

clear, in advance, that any armed attack affecting our national security would be met with overwhelming force, the armed attack might never occur."

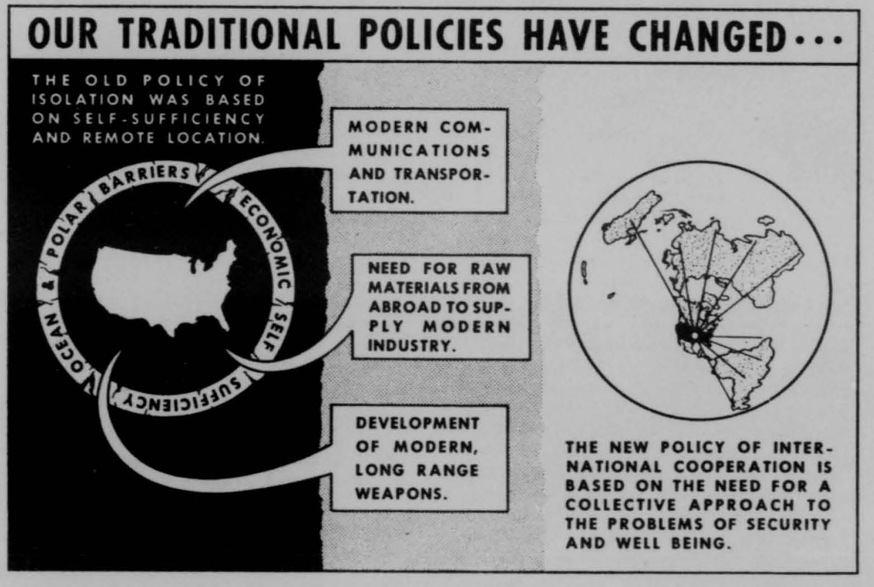
Furthermore, the armed forces act as the hewers of wood and drawers of water for the civilian agencies charged with policy-making. The occupation of Austria, Germany, and Japan; the Berlin airlift; the military missions in Greece and Turkey—all these are examples of how our armed forces implement our foreign policy.

The officer of the armed services has a dual interest in acquiring some knowledge of the ways in which foreign policy is formulated. First he has an interest, as a citizen, in one of the most important tasks of our people and their government today. Second, as an officer he has a close personal interest in those determinations which may make the differences between peace and war and which certainly decide the nature and location of a great deal of his service.

FOREIGN POLICY IS DEVELOPED BY COMPLEX PROCESSES

Most of us have considerable knowledge of the process of formulating internal policy in the United States. This is the legislative process of making laws and, in the field of detailed policy formulation, the administrative process of carrying them out by various means, from presidential executive orders to minutely detailed policy determinations such as those sometimes found in Army regulations.

The process of foreign policy formulation is more obscure. Until re-



THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

cently the United States has not required a great mass of foreign policies. Although we did become involved in foreign armed conflicts, we were comparatively aloof and detached from international matters in the policy making sense. Now, with a more integrated world, it becomes necessary that we maintain views and positions on almost every issue and subject discussed among nations. Our representatives enter dozens of meetings every week with officials of other countries. Our participation in the United Nations has already meant that our representatives have had to propound a United States view in thousands of committee meetings. Participation in these meetings is not confined to State Department officials. Army officials, uniformed and civilian, have also presented United States policy in the occupation areas since the close of hostilities. Obviously there now exists an everpresent and everchanging need for policy guidance to be provided for our representatives on the "contact-line" of international affairs.

Another reason for the obscurity concerning formulation of foreign policy is the impossibility of reducing it to any simple cut-and-dried formula. A chief reason for this is that a foreign policy must be not only acceptable to the President, the Congress, and the American people, but also realistic as to conditions outside the United States. Hence foreign countries and their policies inevitably have an enormous influence on the formulation of our foreign policies. The problem is far more difficult than passing a law or issuing an order in the nation's internal affairs. Instead, many courses of action in foreign affairs may have to be worked out by conference and compromise with other nations. The policies of foreign governments may force our government to formulate policies which, of its own free will, it would never choose. The aggressive and expansionist policies of Germany and Japan in the 1930's caused the United States to evolve such policies as the Neutrality Acts, and finally to enter that ultimate in foreign policy—war. The foreign policy of Soviet Russia today obviously activates a considerable portion of our foreign policy as do the foreign policies of the western European nations cooperating with the United States in Germany, in the European Recovery Program, the Atlantic Pact, and the United Nations. The Berlin airlift was necessitated by the Soviet policy of blockading Berlin; the Greek-Turkish aid program and the Truman Doctrine were developed within a few weeks to meet the situation created by Britain's decision that she could no longer afford to continue assistance to Greece and Turkey on the scale previously provided.

OUR POLICIES CHANGE, BUT OUR OBJECTIVES DO NOT

America's foreign policy objectives of security and well-being have remained unchanged since 1778, when Benjamin Franklin took this nation's first major foreign policy step. In that year, Franklin arranged with France a military alliance to last "forever." Our country shortly reversed this initial trend and adopted "no entangling alliances" as a fundamental policy. This policy was indorsed by Washington in his Farewell Address (1796), in which he pointed out that "Europe has a set of primary interests which to us have none or a very remote relation," and that "our detached and distant situation invites us to pursue a different course from Europe..." In 1949, we are no longer "detached and distant" from Europe or any other place and find ourselves neck-deep in world

1736

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

responsibilities. Incidentally Washington urged his country to maintain a "respectable defensive posture," a policy never heeded in peacetime prior to World War II.

Other fundamental policies in our history, in addition to "no entangling alliances" include: freedom of trade on the seas during wars between other nations; the Monroe Doctrine which states that we opposed any further colonization or interferences by European nations in this hemisphere; the Open Door Policy which implemented the United States view that parts of China should not be taken over by foreign nations and that every nation should have an equal chance in trade with China; and the Pan-American policy. Obviously even such long-range and general policies may go out of date and require major changes, but the objectives of security and well-being remain unchanged.

FUNDAMENTAL POLICIES ARE SUPPORTED BY MANY DETAILED POLICIES

The fundamental policies and most important supporting policies are usually broad general statements; e.g., "no entangling alliances," the Monroe Doctrine, the support of a world order (UN), the policy of helping free nations in Europe to help themselves toward recovery (Marshall Plan). In the early history of the United States these broad general statements were often sufficient. For instance, the Monroe Doctrine was little more than rhetoric for 40 years. Then France supported Maximilian in Mexico and the United States had to become specific. In today's fast-moving international situation any generally stated policy usually requires that specific and frequent action be taken on it.

A whole family of minor policies

and implementing actions usually must be produced to define and support each major policy. For instance, the general policy in the Cairo Declaration (1943) contains a statement that "in due course Korea shall be free and independent." This statement did not decide whether the United States should put occupation forces into Korea; it did not decide what sort of government General Hodge should set up when he arrived there with the XXIV Corps; and it did not decide what his relations ought to be with Soviet forces.

Turning to even more minor policies, the Cairo Declaration gave General Hodge little guidance as to what to do when the Soviet forces shut off the electric power for the capital city of Korea. It gave even less guidance to a lieutenant commanding a platoon on the 38-degree parallel when he first met the problems of a lot of people without homes or food trying to move from North to South Korea. That would

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

have been a very minor policy matter to policymakers in Washington. It would certainly be a major matter to the lieutenant. The formulation of policy can be compared to the growth of a grove of trees in which the trunks are the fundamental policies.

There are branches, twigs, and leaves on eacy policy tree representing subordinate and detailed policies. Like twigs and leaves, some of these minor policies are coming into being every day, some are growing, some are dying. Once in a while a fundamental policy dies. For example, the "no entangling alliance policy" was uprooted by the new fundamental policies of support of the United Nations and the Atlantic Pact.

The Pan-American policy, once primarily an expression of good will, has grown during a century to include a military agreement (Rio Pact). It includes such minor branches as appointing United States military missions to Latin-American countries, and sending Latin-Americans as cadets and midshipmen to West Point and Annapolis. The major policy of the Marshall Plan is, in a few words, the helping of European nations to help themselves toward recovery. This major policy has resulted in the appropriation of billions by Congress and the setting up of a complicated administrative organization—the Economic Cooperation Administration.

It is obvious that policies may conflict in their implementation even as the branches of trees in a forest crash against each other in a storm. There are then presented the most difficult problems of policy formulation. Perhaps a compromise solution is indicated. Perhaps reference to the objectives of security and well-being will often be clarifying.

THE PEOPLE—THROUGH THE PRESIDENT AND CONGRESS—SHAPE OUR POLICY

The American people determine foreign policy in the long run through approval or disapproval of the President and Congress, expressed at the voting polls. They also have a tremendous day-to-day effect through their expression of views in the press, in public opinion polls, and through pressure upon government policy-formulating agencies by private citizens and organized citizen's groups. The policy-formulating agencies are staffed by persons elected, appointed, or in the profession of government service. They are bound to be influenced by their backgrounds and particularly by their education.

The neutrality legislation of the 1930's is an example of policy greatly influenced by public pressure. Even when initially there is no developed public view on a proposed policy, the long-term public reaction may be of great importance. If a policy fails of public support it will probably be unsuccessful in the long run. This is particularly true if the implementation of the policy requires continual provision of taxpayers' dollars—as does the European Recovery Program. War is the most costly of all detailed policies and affects all citizens. Hence it requires an overwhelming public will in order to be effective. A 51% support is not enough for such costly policies. This is one of the main reasons why broad public knowledge in the field of international affairs is now of such great importance. The taxpayer tends to view coolly any costly policy—at least until he understands its necessity.

The President is the single individual primarily responsible for the

1738

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

foreign policy of the United States. The Constitution provides that he shall have power to make treaties, provided that two-thirds of the senators present concur. He may appoint ambassadors, ministers, and consuls with the consent of the Senate. He is empowered to receive the representatives of other nations. He recommends to Congress the legislation and appropriations required to carry out foreign policy. As Commander in Chief of the Armed Forces he directs their activities in support of foreign policy.

THE STATE DEPARTMENT

Primary responsibility is delegated to the State Department by the President for formulation and supervision of foreign policy. It carries the load for the President.

The State Department is organized so that its staff branches are in daily contact with more than 60 United States diplomatic representatives for foreign countries and international agencies. The most important of the latter is the United Nations. There must be a continual flow of policy guidance to these representatives. The other departments of the Government, in their contacts with foreign nations, also require continual policy guidance from the State Department. The Armed Forces, particularly the Army in occupation matters, and the Economic Cooperation Administration are probably the State Department's best customers, but the Department of Commerce, the U.S. Treasury, and other agencies also need advice.

THERE IS NO AUTOMATIC POLICY-MAKING MACHINE

The State Department does not formulate policy in a vacuum.

It does not have a policy-making contraption with which it turns out answers by pressing a button. Foreign policy cannot be reduced to fixed mathematical formulae and filed away on index cards. It is a living evolutionary force defined in direction and method but often not in detail.

The mechanism for policy formulation includes an elaborate system of informal liaison between the State Department and other Government agencies, and informal conferences with the President and leaders of Congress as well as formal written communications. The National Security Council, headed by the President, is charged with making determinations on foreign policy matters involving security. Its membership includes the Secretary of Defense and the Secretaries of the Army, the Navy, and the Air Force, as well as the Secretary of State.

CONGRESS PLAYS AN INCREASING ROLE

The Congress is taking an ever-increasing part in formulation of foreign policy.

Policies require means to make them effective. Often these means are not available unless Congress provides the authorizing legislation and the appropriations. For instance, the Marshall Plan would have had little meaning unless Congress had voted the billions to give it effectiveness. There is a committee in the Senate (Foreign Relations) dealing with foreign policy matters. The appropriations committees, particularly that of the House, also can materially affect foreign policy.

It is apparent that a nonpartisan foreign policy is now very important.

RESTRICTED

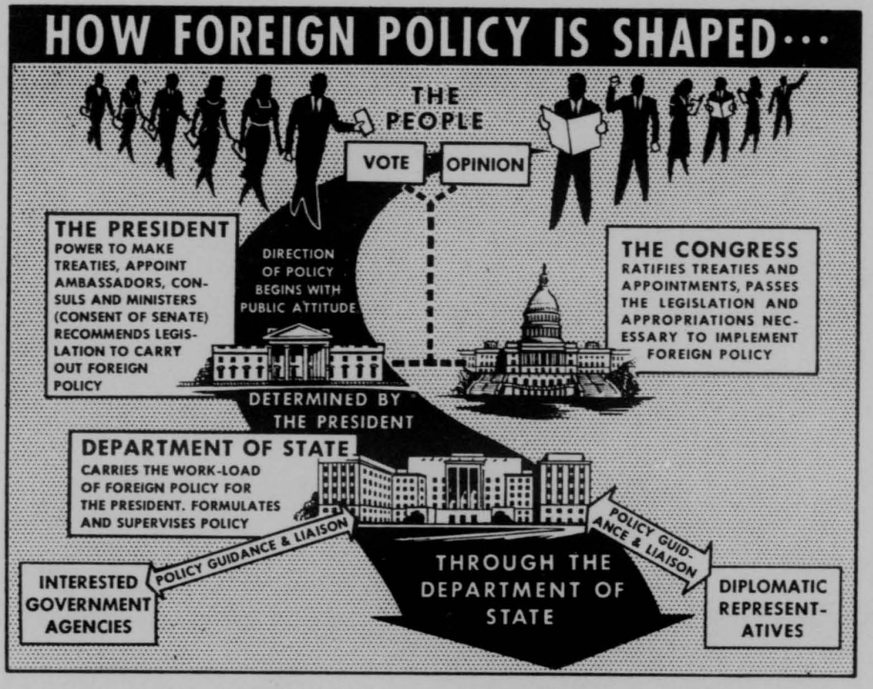
1739

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED



Foreign countries know that in the United States no political party remains in power permanently. Hence if a foreign policy were partisan—that is an issue between the parties—it would lose some or much of its strength. This situation makes formulation of policy more complicated since a course of action which both parties will support is highly desirable and sometimes necessary to success.

The size and the components of United States Armed Forces should logically be consistent with the international situation and the United States policies for dealing with it. Hence the State Department and armed services often find themselves closely associated in explaining, to Congress and the public, policies pertaining to United States security including the Armed Forces budget. For instance, General Bradley's Army Day speech in 1949 concerned, at the request of the State Department, many aspects of the Atlantic Pact which were not purely military. This was a recognition that military factors are so interwoven with other factors in foreign affairs than an attempt to separate them into compartments makes no sense. More than ever before in its peacetime history the United States is now attempting

1740

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

to relate its military security arrangements to foreign policy and the foreign situation, and vice versa.

FORMULATION OF POLICY CAN BE DIVIDED INTO FOUR STEPS

It sometimes helps to divide a complicated problem into parts even though the subdivisions are somewhat arbitrary. Four steps (not necessarily in proper sequence) in policy-making are:

1. Recognition of the need for a policy or a change of policy on a specific problem.

This is not always easy. Many people may argue that no new policy or change in policy is required. They may even argue that no problem exists affecting the United States. There was a great deal of such argument between the date Hitler came to power and Pearl Harbor.

For years after Hitler gained control of Germany the United States continued its policies of isolation and "no entangling alliances." It supported these policies by detailed actions such as the Neutrality Acts forbidding United States ships to carry goods to a country at war, and the "cash and carry" act requiring that a belligerent pay cash for any goods bought in the United States. But, starting definitely as early as President Roosevelt's speech in 1940 calling Italy's attack on France a "stab in the back," the United States began to reverse its age-old policy.

Within a few weeks thereafter the President of the United States and the Prime Minister of Canada agreed to set up a Permanent Joint Board of Defense. In 1941 came "lend lease" to the countries fighting the Axis. In 1945 the United States joined the United Nations and also contributed a great proportion of the resources for UNRRA. In early 1947 the United States recognized that words needed to be backed by acts if the words were to be effective in preventing Greece and Turkey from being forced to adopt measures contrary to the wishes of those countries. Hence the Greek-Turkish aid program. In 1947 the United States signed the Rio Pact previously mentioned, binding the United States and all Latin-American nations on the basis that an attack on one is an attack against all. In 1948 came the Marshall Plan and in 1949 the Atlantic Pact emerged, which, if ratified, will complete the change from the fundamental policy of isolationism of 1939. The United States has now been committed to policies of collective security and of aiding friendly countries willing to help themselves. The objective of these policies is security. Furthermore, the sequence of policy steps described above indicates the true nature of policy formulation. Policy is not born overnight. Often it evolves with only direction and method being clearly apparent.

2. The development of the policy among the responsible and affected agencies of the government.

This process may be viewed as another step in policy-making-recognition of the need for a policy. There may be major disagreement as to what the policy should be. For instance, there is now general recognition of a need for some definite policy concerning China. But there now also exists a difference of opinion as to what should be done about it. The State Department has not favored increased economic and military aid to Nationalist China, yet various bills to the contrary have been introduced in Congress by individual congressmen.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

The development of the policy of the European Recovery Program (Marshall Plan) is probably the most complete program of planned policy development ever undertaken in the United States. Following careful studies made by the State Department in collaboration with other interested governmental departments, Secretary Marshall put forth the general idea in a speech in June of 1947. He said:

"...before the United States Government can proceed much further in its efforts to alleviate the situation and help start the European world on its way to recovery there must be some agreement among the countries of Europe as to the requirements of the situation and the part these countries themselves will take...The initiative must come from Europe. The role of this country should be friendly aid in the drafting of a European program and of later support of such a program as far as it may be practical for us to do so."

Secretary Marshall's brief general statement immediately touched off tremendous activity. The western European nations met to consult among themselves and draw a plan. There were consultations between diplomats of the United States and those of Western European nations, both individually and as a group. Several expert committees studied the problem in the United States and made detailed proposals thereon.

A bill sponsored by the State Department was introduced in Congress. The contents of this bill, as it became law, constituted detailed policy formulation. Congress held hearings at which government officials and private citizens expressed their views. Throughout the United States there was wide public discussion on the proposal. Finally, 11 months after Secretary Marshall's speech, Congress passed the Economic Cooperation Act of 1948 and the policy initiated nearly a year before was completely formulated—in this case by a law.

3. Enunciation of the policy.

The more important policies normally are stated initially and in general terms by the President as in the case of the Truman Doctrine, or by the Secretary of State as in the case of the Marshall Plan. But policies may be promulgated in a great variety of ways. They may appear in speeches by responsible Government officials, in press releases, in statements by the senior United States representatives in the occupied areas, or in diplomatic notes.

Policies sometimes are not formally enunciated at all but rather become apparent through a consistent pattern of detailed actions. For instance, a program of strict and formal reciprocity with another nation might be first indicated by limiting the visitors to the United States from that nation to the same number as the United States citizens permitted to enter the other country concerned.

4. Implementation of the policy.

In some instances a policy may be completely formulated and enunciated without necessity for any implementing action. The Monroe Doctrine did not require any positive actions for years after its enunciation.

Today policies are usually ineffective or only partially effective unless something concrete, and often costly, is done about them. Implementation often requires passage of laws by Congress (which in themselves

1742

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

formulate details of the policy as in the case of the Marshall Plan) and provision of appropriations by Congress.

Congress, after approving the legislation for the Marshall Plan then went on to provide the funds to support it. An organization to administer the law and the funds was required. Hence the European Cooperation Administration, headed by Paul G. Hoffman, was organized with a large office in Paris and missions in each of the 18 countries (including Trieste, Western Germany, and Austria) participating in the program. The day-to-day operations of the ECA required continual detailed policy formulation. Typical questions were: "Should there be any limitation on trade to Iron Curtain countries of items particularly useful for armaments?" and "Should the ECA pay any attention to the Netherlands failure to adhere to the wishes of the United Nations concerning the disturbances in Indonesia?"

Many agencies of the Government other than the State Department are engaged in implementing and supporting foreign policy. These include the armed services, the ECA, the Department of Commerce in connection with foreign trade, the United

THIS PAGE IS UNCLASSIFIED

States Treasury in connection with loans and monetary matters. Each requires detailed policy guidance which is worked out on a day-to-day basis by the State Department in consultation with the other agencies which are affected and hence can provide expert advice.

It is obvious that a policy may be changed by the detailed laws passed by Congress. It also may be changed or even stalemated by the reaction of foreign countries. For instance, the ECA, as initially enunciated by Secretary Marshall, conceived economic cooperation among all the countries of Europe. The refusal of the Soviet Union and countries behind the Iron Curtain to participate in the plan changed it materially. As another example the original United States policy of treating Germany as an economic whole has been completely frustrated by lack of agreement between the USSR and the United States, Britain, and France. A new policy had to be devised which has now resulted in steps to set up a west German provisional government.

The North Atlantic Treaty in its present form resulted from conversations which began in Washington in the summer of 1948 among the representatives of the five Brussels Pact Signatories, the United States, and Canada. It stems from policies included in the Constitution of the United States, the Monroe Doctrine, the Inter-American Treaty of Reciprocal Assistance, the Fulbright and Connally Resolutions, and the Charter of the United Nations, to mention only the more important ones. It may be truly stated, however, that Senate Resolution No. 239 (The Vandenberg Resolution) approved in June 1948, provided the immediate impetus to the development of a North Atlantic Treaty. This resolution provides for: "Association of the United States, by constitutional process, with such regional and other collective arrangements as are based on continuous and effective self-help and mutual aid, and as affect its national security." In taking this action, the Senate leaders responsible for this bill no doubt consulted with the State Department and the National Military Establishment. Ten months later, based on this formal declaration of the United States Senate, the United States formalized the policy quoted above by becoming a signatory member of the North Atlantic Treaty.

THREE IMPORTANT ASPECTS OF POLICY-MAKING

1. A policy should be logically within United States capabilities to carry it out.

2. The Government agencies charged with implementing a policy, and with providing the means, usually need to be consulted on any policy. On security matters the State Department would either need an "armed forces general staff" on its payroll or alternately would need to consult the armed services. In practice the National Military Establishment is consulted and makes recommendations through informal contacts and through the National Security Council.

3. There is a four-cornered check on the formulation of important foreign policies. The corners are occupied by:

a. The President and State Department.

b. The United States public.

c. The Government agencies whose responsibilities are affected by the proposed policy.

1744

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

d. Congress, which provides the means.

This four-cornered situation requires integration and consultation among all concerned. For instance, this need was recognized by Secretary of State James F. Byrnes when he took with him to conferences on the Italian and Balkan peace treaties the senior Democratic and Republican senators on the Senate Foreign Relations Committee. There usually must be a substantial meeting of the minds of the people in the four corners before a policy will work with certainty. An in addition it must be considered from the standpoint of the reaction of affected foreign countries.

SUMMARY

Policy formulation has become steadily easier in some respects as the United States has settled on those basic policies which we feel we wish to follow or are forced to follow in the post-war years. Some of these basic policies now seem clearly to be: (1) support of the UN, (2) preparedness in a troubled world, (3) support of like-minded peoples by such concrete programs as the ERP and Atlantic Pact, and (4) resistance to communism. These basic policies are pillars supporting the objectives of security and well-being now and in the future. Now that the basic policies are developed and generally accepted by the United States people, it is easier to formulate minor supporting policies.

Nevertheless, the formulation of major foreign policy is a continuous and very complicated matter. It is affected by foreign nations and international agencies as well as by the wishes of the United States public and United States government. Policy formulation involves development of basic policies, and of minor policies which are plans and programs supporting each basic policy. All should stand the test question as to whether they further the objectives of our foreign policy.

The State Department has the primary responsibility for formulation of foreign policy or—to put it another way—for making recommendations to the President on foreign policy. The National Security Council has a primary responsibility to make such recommendations on security matters. Many other Government departments and agencies are now deeply and vitally concerned. Usually policy cannot be effected long unless accepted by the United States public, and by Congress which makes the laws and provides means and money. Congress can formulate policy through legislation, providing the President does not veto the legislation.

One of the most important responsibilities of an officer of the armed forces, both as a servant of the United States and as a citizen, is the comprehension of international affairs and of the detailed effect of our different foreign policies on the objectives of security and well-being of the United States. In the long run, the achievement of these objectives, and hence the survival of the United States, depends on public understanding and support in these matters, and on the understanding and wisdom of Government officers in carrying out policies in peace, cold war, and—if it comes—hot war.

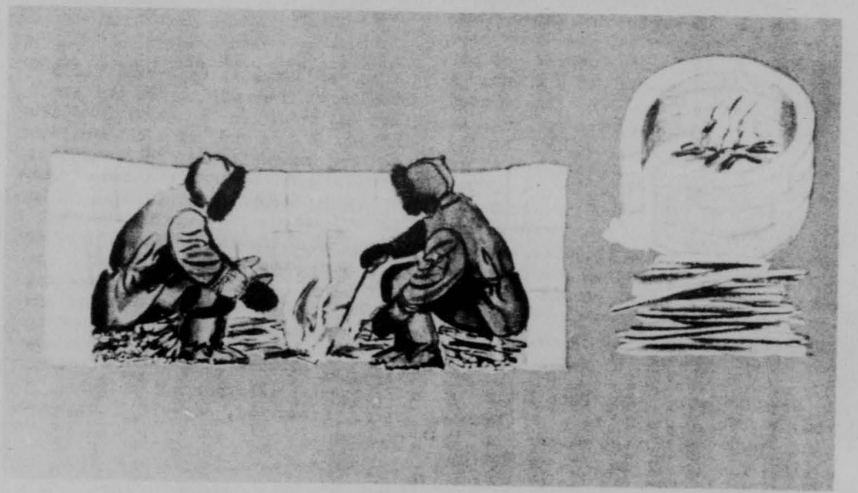
THIS IS THE NINTH OF A SERIES OF ARTICLES ON ARCTIC INDOCTRINATION

Chapter 18--Land Survival (Continued)

FIRE

In survival, there is no question at all as to the value of a large cheerful fire. Aside from its warmth, it is a great asset from a morale standpoint and an aid to rescuers as well. However, many people have sacrificed so much just to have a large fire that they have defeated some of its purposes. So, instead of starting a raging inferno as soon as you hit the ground, stop for a minute and figure out what you want it for. Then design a fire to meet your needs. A B-29 crew picked up last winter, for example, had a strong fire going when found, but had completely neglected to build any sort of shelter, or even to erect a windbreak. Naturally, these men were cold and uncomfortable. If they had put as much effort into building a shelter as they had into building a blazing fire in the wind, they would have discovered that a single candle in the shelter would have netted them much more comfort than ten logs burning in the wind. The wrong kind of a fire--one that doesn't meet your needs--can be more detrimental than helpful.



A Windbreak is Essential.

RESTRICTED

STARTING THE FIRE

Making a proper fire begins a while before you light a match. It starts with protecting yourself and the fire-to-be from wind. In wooded areas, the standing timber or brush usually makes a good enough natural shelter; but in open timber or low brush country erect some kind of barrier, if the wind is blowing, to break that wind, using materials and methods of construction similar to those you used in building your sleeping shelter.

A row of snow blocks, the shelter of a pressure ridge, or a scooped-out side of a snow drift will work well on the ice pack. A circular wall of brush, cut and stuck in the snow or ground, will work well in willow country. A ring of evergreen boughs is fine in timber. Make this wall about four feet high and, except for an entrance way, circle your fire area with the wall in windy weather. The extra warmth you will get from even a small fire with a wind break will more than repay you for your efforts in constructing the wall.

The next step in fire-making is gathering necessary materials to start and sustain a fire. These materials can be divided into two classes--fire starting and fire sustaining. The airplane will help you out with the first type, if not both. There are gasoline, oil, rubber, cloth, dry wood, paper, celluloid, and many other man-made products which make better kindling than whittled chips of trees.

Good kindling includes anything that burns easily, especially lightweight materials that ignite directly from a match and furnish heat enough to fire the larger pieces of wood, coal, or fat that constitute the principal fuel. Tufts of dry grass, birch bark, sedges, pine needles, the pulpy interibrs of many plants in the marshland, and the dry lichen that covers the twigs of black spruce and tamarack meet these requirements.

Cross-Section of Fire.

If you have animal fat (blubber) available, you can improve the igniting qualities of any of these types of kindling considerably by laying the fat between the kindling and squeezing. This forces the oil out of the fat and causes it to be absorbed.

Your fire is something that must grow from a match to burning logs; so use your kindling at the base of logs or other heavy fuel. Place some material on the ground and lay a few smaller sticks over it. Then distribute more kindling toward the center of those small sticks and continue building up the pile until it's about a foot high. On the center of this pile, lay the ends of four or five logs, letting the logs themselves stretch out from the center.

If you must build a fire on the snow, lay a base for it of logs, cowling, or other materials, to prevent the fire from melting a hole in the snow, falling into it, and going

1747

THIS PAGE IS UNCLASSIFIED

Starting Fire with Cartridge.

out. On high land, when the forest litter is dry, make a clearing for your fire; otherwise you may start a fire that will be hard to put out. In any case, always put your fire out completely before leaving a camp site.

In lighting a fire, strike the match and hold it so that any breeze will blow the flame into the fuel--not out of it. Handle any other flame-producing device similarly. If you're short of matches and have any paper or oil-soaked cloth, use one match to light the paper or cloth and use the paper or cloth to light the kindling of the fire. When you strike this first match, you'll really be thankful you've taken the time to build the windbreak around the fire area; and as you see the flames leap up through the tinder and small sticks to the larger sticks and finally consume the ends of the logs, you'll appreciate the reflected heat and lack of wind as you cook and dry clothes around this fire.

Starting a fire without a match is difficult under the most ideal circumstances and is really tough under low temperature, high wind conditions. Start worrying about this problem before take-off and provide yourself with an ample supply of matches in waterproof containers on your person. Don't depend on the next fellow; bring your own.

However, if you're stuck with a pocketful of wet matches (or have no matches at all) the flint and steel in your emergency kit will prove extremely valuable. This flint and steel will produce a spark, but only a small one, which you must build into a fire. In warmer weather, you can get sparks from a battery instead of the flint, but, at low temperatures, the battery will not produce a spark sufficient for fire-starting.

A spark will do you no good at all if you strike it in the wind in an attempt to light a soggy piece of wood. Plan your fire-starting carefully, therefore, and use your most volatile kindling material. Gasoline serves this purpose very well. Oil that is not congealed can also prove helpful.

Where game is scarce and ammunition is plentiful, it may be wise to remove the gunpowder from a cartridge or shotgun shell and put this at the base of your fire, using the flint spark to ignite it. If you are without flint, or if it is too cold to obtain sufficient sparks from a battery, your next best bet as a fire starter is a magnifying glass or any bent glass or plexiglass which may be utilized as a magnifying glass. However, even where it is visible, the Arctic sun is weak through the winter months. It will take much patience to hold the magnifying glass in a position that will focus a spot on gunpowder long enough to get results. And if you don't protect your kindling against the slightest draft when using the sun's rays as a fire starter, even patience won't help you.

You can also use gunpowder and

1748

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

cartridges to start a fire without the aid of the sun or a spark. Build a properly sheltered pile of kindling and wood and put the powder from a shell or shot at the base of the stack. Then hold a powderless and bulletless shell or cartridge in a pair of pliers close to the powder at your base of your fire and strike the outside of the shell primer with a sharp metal object. Another alternate, if you have a side arm, is to dump the gunpowder of several shells at the base of the fire in the usual manner, replace the shot or bullet from a shell with a piece of paper or cloth to hold the powder in position, and load this cartridge into the chamber. Then aim the gun at the powder at the base of the fire, holding the end of the muzzle at least an inch away from the powder, and pull the trigger.

If you have a tin can gasoline stove (described later), try removing the bullet or shot from a cartridge or shell. Then even if you have a long-barrelled gun, hold the gun barrel inside the tin can stove (but not under the sand or gasoline), and fire the piece into the stove.

A pyrotechnic pistol fired into the base of a well built pile of kindling, sticks, gasoline, or oil, is another way to get a fire started.

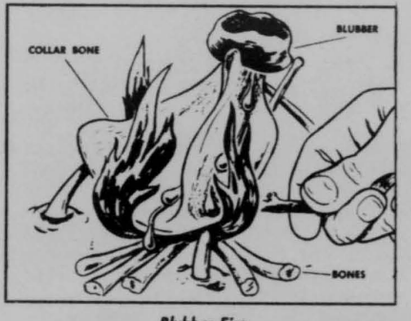
FUEL

Fuel is available in many parts of the Far North. In some places there are outcroppings of coal at the surface of the ground and sometimes lumps of coal are washed up on the beaches. This coal is commonly of the soft variety which produces a black smoke and an odor like asphalt.

In the tundra you will find some clumps of low growing willows and birches which can be split up into fine pieces and burned green. Birch is quite oily and if split fine will burn even when wet. In addition to standing timber there are some limited sources of dead wood. Sometimes you can find driftwood in the slack waters of river mouths and along the seashore where it has been cast up by storms. Driftwood is a great traveler and can be found on almost every shore of Alaska.

Most sub-polar lands are timbered. Hence, fuel in these regions is usually wood. The driest wood is in dead standing trees. Frozen green timber appears dry but is relatively heavy and has a hard ringing sound when struck with an ax. Frozen dead wood, on the other hand, has a dead dry rattling sound when struck. In living trees the branches above snow level are the driest. Places from which the bark has fallen are drier than those covered with bark or lichens.

Make every effort to keep a fire going at all times, even if it's a small one that must be built up as needed. If you are down in an area where there's plenty of wood and you have a crew with you, it's a good idea to spend the efforts of one



Blubber Fire.

1749

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

person in gathering wood to keep a central fire burning. Under these conditions it's more successful to take turns sleeping than to pile your fire up with logs and all sleep at once. However, if you are alone, put a couple of logs on the fire and sleep for short periods of time, but keep a little fire going if at all possible. It will serve as a good signal and will also save your precious supply of matches.

Remember, though, no matter how plentiful wood is, it still costs you energy to drag it to the fire area. Don't throw more logs on the fire than you need at any one time. Lay them around the inside of your windbreak and sit on a few of them. Try to gather them through the light of the day and bring them as close to your fire area as possible so that you won't have to stumble through the darkness looking for wood when night comes.

GASOLINE STOVES

While you'll find an abundance of driftwood along most of the Alaskan coastline and throughout the northern Canadian shores, and while most of the inland areas of the polar region provide standing and fallen timber for fuel, there are still the great frozen sea areas which are barren so far as wood is concerned. The lack of wood does not mean that you cannot have a fire if you stay with your plane for the same type of material which makes kindling can also sustain fires.

The simplest and best fuel from an airplane is gasoline. But if you plan on burning gasoline, remember that you must use some other material as a wick—you can't just light a pot full of gasoline. You can make wicks of any material that will absorb gasoline. Parachute webbing, for example, makes a good wick. Roll it into a ball and place it in the bottom of any type of receptacle or open-top can with part of this wick sticking out above the gasoline. Another good way of burning gasoline is in a tin can stove. Just punch holes in the side of the tin can, cut the top of the can at intervals, and bend the sections down, as shown in the illustration.

Fill the bottom of the can with two or three inches of sand, then pour gasoline into the bottom of the can so that the level of gasoline does not rise above that of the sand. To use this gasoline stove, simply light it and leave it burning until all the gasoline is gone, then refill it. This kind of stove beats the wick type in that the sand never burns out, while a wick will be consumed.

Reading about a tin can stove, which is a really fine little device for cooking and heating, is not going to help you a bit if you are down on the ice pack with just gasoline and tin cans. There are certainly no sandy beaches there. However, if you plan your emergency equipment properly, you'll find room somewhere in your airplane for a few empty tin cans and a couple of pounds of sand, because this simple little stove will work for a long period of time. It does not tip over rapidly, and can therefore be used in small interiors. It has no mechanical parts to get out of order, and requires no cleaning. In addition, it will burn any type of aircraft fuel.

FIRES OF ANIMAL FATS

If you are in any danger of running short of food, don't use as fuel anything that can be eaten. You get more heat value from food that you eat (raw, if necessary) than from food that you burn. Similarly,

1750

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

clothing that you wear on your back is the source of greater continued warmth than the same clothing used as fuel. However, if you have plenty to eat you may use animal fat as fuel. Eskimos burn seal blubber with seal bones as the wick. They make a little pyramidal pile of them. They then saturate a small rag with oil from a small piece of blubber, light the rag, place it inside the bone pile, and lay the blubber carefully on top of the pile. The heat rends the oil from the piece of blubber and the oil drips onto the now-heated bones and ignites.

You can make a better blubber stove from a tin can about the size of a one-pound coffee can with the cover removed. Punch it full of holes--small holes not over one-fourth inch in diameter are best. Punch the sides and the bottom. Then build the wick from seal bones, a piece of canvas, dry tundra moss, or a piece of sealskin with the hair-side up. Impregnate the wick with the oil, light it, and place the perforated coffee can over the flame. Lay the blubber on top of the can. The oil dripping from the blubber into the heated air inside the can will burn far hotter than it does when the blubber is placed directly on the wick without the can. The smell is somewhat akin to that which rises from the Chicago stockyards on a hot July day, but you can be sure that if you are ever reduced by necessity to burning blubber, the cheery flame will certainly neutralize the odor.

GUNS AND AMMUNITION

Take very good care of your guns and ammunition. They may be your only means of securing food. Even though you haven't fired a shot, clean the inside of the barrel of your rifle daily by drawing a piece of dry cloth through it several times. To do this, attach the weight in your fishing kit to a short section of the line and attach a piece of cloth to the other end of the line. Then drop the weight through the barrel and pull the cloth through.

In rough country, handle your gun carefully to protect the front sight from being jarred out of alignment through striking on rocks or against brush.

A shotgun works fairly well even with dirty barrels and no sights at all--but at least keep the breech mechanism clean and dry. In very cold weather, don't oil the gun. Lubricate with graphite, if available. If oil gums up the firing pin, even the best gun may fail to function at 30 below. To keep the gun from "sweating," don't bring it into the warmth.

If you have an over-and-under gun, be particularly careful with the "thumb selector" by means of which you can select either the rifle (selector in up position) or the shotgun (selector in down position). This mechanism comes loose easily, and if it falls out or gets stuck, only one barrel of the gun will fire. If you're out of ammunition for that particular barrel, the gun will be useless.

Keep your ammunition clean and dry. Before using cartridges from a freshly opened box, rub the grease off them with cloth, leaves, or tree bark and save the material you rub with for fire-making. In rainy weather, carry paper shells in an inside pocket. If you have to swim a stream with your clothes on, throw your ammunition across, then cross over yourself.

NEW ADMINISTRATIVE UNITS IN YUGOSLAVIA

A new administrative system for Yugoslavia was ordered by the Praesidium of the National Assembly of the Federative Peoples Republic of Yugoslavia on March 25, 1949. The action was subsequently confirmed by the National Assembly during the three-day session of May 26-28. The six Peoples Republics which make up the Federative Peoples Republic of Yugoslavia were directed to establish smaller administrative units, called oblasts, within their borders. Each newly created oblast was then to be responsible directly to the central government at Belgrade (Beograd), not to the parent Republic.

In conformity with the decree of the Praesidium twenty-one oblasts have been created. Five have been formed within the Peoples Republic of Serbia (Srbija), in addition to the previously functioning Autonomous Province of the Vojvodina and Autonomous Oblast of Kosovo-Metohija; six in the Peoples Republic of Croatia (Hrvatska); four in the Peoples Republic of Bosnia and Herzegovina (Bosna i Hercegovina); and three each in the Peoples Republics of Slovenia (Slovenija) and Macedonia (Makedonija). Because of its small area and population, the Peoples Republic of Montenegro (Crna Gora) is not subdivided.

The following are the new oblasts:

Banja Luka	Bjelovar	Kragujevac
Beograd	Gorica	Ljubljana
Bitolj	Karlovac	Maribor
Mostar	Sarajevo	TitovoUzice
Nis	Skoplje	Tuzla
Osijek	Split	Zagreb
Rijeka	Stip	Zajecar

The revised map, #11322 included in this article, locates the oblasts within the Republics. The cities of Ljubljana, Zagreb, Sarajevo, Beograd, and Skoplje are not included within oblasts, but are administered independently.

The new organization resembles the system that prevailed from 1921 to 1929. At that time, Yugoslavia was divided into 33 oblasts, which were the largest administrative units in the country. Under the new organization, there are but 21 oblasts. The difference in number is chiefly because the Vojvodina and Kosmet were not separate administrative units during the earlier period, but were divided among a number of oblasts. In other areas, the oblasts of the two periods correspond closely in size and number. Then as now, Slovenia (without Istria) was divided into two oblasts and Macedonia into three, but the boundaries differed slightly in detail. Large segments of the old boundaries, however, correspond closely to those established in 1949, particularly where the oblast boundaries are also boundaries of the Republics.

In 1929 the thirty-three oblasts were replaced by nine banovinas and the prefecture of Beograd. By the change the new Beograd administration hoped to eliminate sectional consciousness and separatism and to remedy the inefficiency of the oblast system. The Banovina was designed to be a large economic unit with considerable independence. The plan was never wholly carried out because of continuing direction from the central government. The old

historical province names of Macedonia, Slovenia, and Montenegro were abolished in favor of Vardarska, Dravska, and Setska—names with no historical associations. Banovina borders were deliberately drawn across former administrative units. The organization of the Federative Peoples Republic of Yugoslavia in 1946 was based on the administrative traditions which the Banovina system ignored. The Peoples Republics created by the Constitution of 1946 correspond closely either to former independent states or to provinces having a long historical association with the Austro-Hungarian and Ottoman Empires. For example, the line which today marked the northern frontier of the Peoples Republic of Bosnia and Hercegovina was the division between the two empires from 1739 to 1878. The line which is the southeastern Slovenian border was the southern limit of the Austrian provinces of Carniola and Styria. Montenegro was a political entity for centuries. The creation of the Peoples Republics recognized the strong sectional feelings in Yugoslavia, and the Republics were granted a measure of self-government.

The Constitution of 1946, which created the administrative framework of the Peoples Republics, authorized the future establishment of various minor civil divisions. Physically, the oblasts established in the spring of 1949 are organized in accordance with the constitutional provision. Their administration, however, marks a radical change from the procedure outlined by the Constitution. The Constitution specifically directs all federal ministries concerned with internal affairs (including Finance, Commerce, Agriculture, and Forests) to carry on their business through the corresponding ministries of the Peoples Republics. The federal ministries are permitted to conduct directly enterprises of nationwide importance only. The Constitution also specifies that the working groups of any minor civil division are to be subordinate first to the administration of that division and then to the appropriate ministry of the Peoples Republic in which the division is located. In short, the Constitution channels through the Republic all contact of the central government with local officials and of local officials with the central government. The executive committees of the newly created oblasts, however, are responsible directly to the central government and so bypass the Republic.

It is possible to trace a recurring problem in the evolution of the Yugoslav administrative system. In prewar Yugoslavia, a many-unit centrally responsible system proved unwieldly. Subsequently, the Banovina system whereby a few units exercised wide local autonomy was not acceptable to the authoritarian monarchy. In postwar Yugoslavia the initial administrative setup consisted of the six Peoples Republics which were charged with carrying out in detail the broadly outlined plans of the central government. Apparently the Tito government found that this system was not compatible with the purposes of the regime. In March 1949 the Tito Government decided to adopt a many-unit system once more.

The reason for the reorganization was suggested in the press which announced that oblasts will relieve the central government of minor administration, and be responsible for production and trade. If the oblasts can effectively direct both production and trade, the state will have tightened its control on the national economy.

AIR FORCE LETTER)
NO. 205-25)

DEPARTMENT OF THE AIR FORCE
WASHINGTON, 30 MARCH 1949

SECURITY

Disclosure of Classified Information to Reserve Forces Personnel

(Effective until 30 September 1950 unless sooner rescinded or superseded.)

	Paragraph
Purpose	1
Scope	2
Policy	3
Investigation and Clearance	4
Residents of Foreign Countries and Foreign Nationals	5
Requirements	6

1. Purpose. To provide uniformity, this Letter outlines the policy of the Air Force with respect to the dissemination of classified military information to Reserve Forces personnel.

2. Scope. This Letter applies to the Air Force Reserve and the Air National Guard, and in addition, its provisions will be followed in connection with activities concerning the Air Reserve Officers' Training Corps and the Senior Division of the Civil Air Patrol. This Letter does not apply, however, to personnel on extended active duty.

3. Policy. In compliance with the provisions of AFR 205-1 regarding security of military information, Reserve Forces personnel may be entrusted with classified information as follows:

a. RESTRICTED information may be disseminated for official military purposes to any Reserve Forces personnel.

b. Except as authorized in c below, information classified no higher than CONFIDENTIAL may be disclosed to Reserve Forces personnel not on active duty who are actively participating in official training activities, provided that possession of the information is essential to the training course or program.

c. SECRET information may be disclosed to Reserve Forces personnel on active duty for training purposes and personnel not on active duty who have a mobilization assignment, provided that possession of the information is necessary in the performance of official assigned duties.

d. TOP SECRET material will not be used for training purposes in connection with Reserve Forces training programs. As authorized by paragraph 7, AFR 205-1, 14 March 1949, however, individuals serving on short periods of active duty whose assignments require it may be given access to the TOP SECRET information essential for the performance of their assigned duties.

e. Documents containing information classified higher than RESTRICTED will not be disseminated for retention by individuals. Such documents will be stored in military files only.

f. Reserve Forces personnel not on active duty who receive classified information will be informed that the information affects the National defense of the United States within the meaning of the Espionage Laws and that its revelation or transmission to an unauthorized person is prohibited.

g. Upon termination of active duty training, personnel will be briefed on the necessity for maintaining security of their professional knowledge while on inactive status.

4. Investigation and Clearance. Commanders concerned are responsible for requesting personnel security investigations and clearing personnel referred to in this Letter whenever required or necessary in accordance with separate Regulations.

5. Residents of Foreign Countries and Foreign Nationals. The provisions of AFL 182-4 and 8f, AFR 205-1, 14 March 1949, will be observed regarding dissemination of military information to persons residing in foreign countries, or to foreign nationals as defined in paragraph 2i, AFR 205-1.

6. Requirements. Although it is the desire of the Air Force to make available to Reserve Forces personnel such classified information as is required for training purposes within established training programs and courses, it is of primary concern that no breach of security will result from this policy. Commanders concerned will review continuously all classified material required by or of direct value to Reserve Forces activities, and whenever appropriate, will initiate down-grading action thereon in accordance with paragraph 27, AFR 205-1, 14 March 1949.

BY ORDER OF THE SECRETARY OF THE AIR FORCE:

*This Letter supersedes AFL 205-25 (formerly 46-7), 31 March 1948.
This Letter has been coordinated with and approved by the Chief, National Guard Bureau, as being applicable to the Air National Guard.

AIR INTELLIGENCE **Review**

This "Review" is published for three reasons:
1. To provide timely data regarding new techniques, practices and general information whereby intelligence personnel can maintain proficiency.
2. To provide material which will afford all personnel an appreciation of the intelligence role.
3. To provide a medium whereby all intelligence personnel and activities may exchange viewpoints, problems and solutions.

Two types of material are solicited for publication:
1. Stories and pictures relating to the intelligence activities being conducted within an organization.
2. Original articles of a noncontrovessial but informative nature.

Material submitted must include sources utilized and the authors name, rank and present military affiliation. Mail stories to: The Editor, "Air Intelligence Review," ConAC, Mitchel Air Force Base, New York.

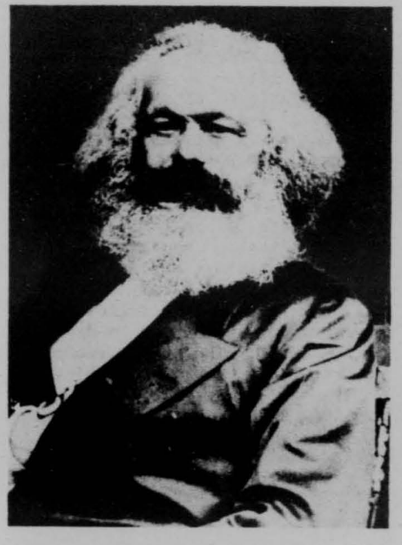
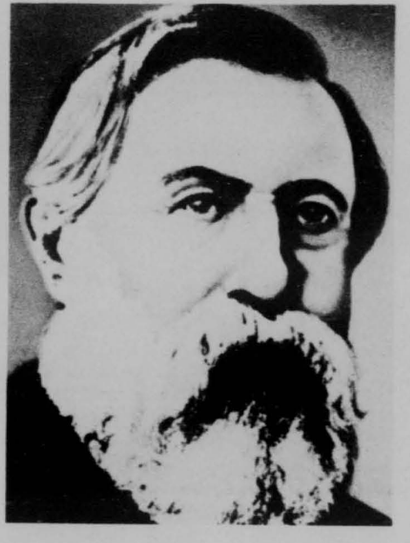
COMMUNISM IN THEORY AND PRACTICE

An Adaptation of an Article by Colonel Edward Barber

THE RED FLAME BURNS MORE FIERCELY AS COMMUNISTS CONTINUE TO USE PLAN DRAWN UP IN 1848 BY KARL MARX AND FRIEDRICH ENGELS



KARL MARX (1818-83). The hirsute, frustrated German philosopher who combined with Engels to write the Communist Manifesto.



FRIEDRICH ENGELS (1820-95). The dilettante son of a wealthy manufacturer, Engels was obsessed with Communism.

"A specter is haunting Europe." This announcement was made 100 years ago by the Communist League in the Manifesto written by Karl Marx and Friedrich Engels. That specter--the specter of Communism--still haunts Europe. Indeed, it now haunts the entire world. Today, we know that the ensuing 100 years, though they have not brought the fulfillment of Communist prognostications, have brought a time when Communism cannot be disregarded.

We in the United States cannot turn our backs to Communist aims as we have in the past. If we and the Communists are working at cross-purposes in the same world, it is well to examine where and how our purposes

MANIFESTO

OF THE

COMMUNIST PARTY.

BY

KARL MARX and FREDERICK ENGELS.

AUTHORIZED ENGLISH TRANSLATION,
EDITED AND ANNOTATED BY FREDERICK ENGELS.

SECOND EDITION.

NEW YORK:
Issued by the National Executive Committee of the S-
1890.

U.S. EDITION. This is the 1898 edition produced, like succeeding editions, by the Socialist Labor Party. First imported English version appeared here in 1872.

cross theirs. When these purposes meet and cross, we should look to see whether it is theirs or ours which is frustrated. If it is ours, we must decide what is to be done.

Obviously, the first step in the analysis of this problem should be to determine clearly just what our purposes are. Then we must proceed to a judgement of what the aims of the Communists are. However, to stay within the scope of this article, it will be necessary to proceed at once to an examination of Communism, assuming for the moment that we have a clear understanding of our own resolves as a nation.

There is ample evidence in officially documented form to afford a thorough study of Communist practices, but these practices defy analysis unless one has a lucid comprehension of the Communist theory.

1848: MARX, ENGELS, AND THE MANIFESTO

Foremost of the fundamental documents on Communism is the Manifesto of the Communist Party, by Karl Marx and Friedrich Engels, published in Germany in 1848. It was compounded as the platform of the "Communist League," a secret society prior to 1848, which is believed to have originated as a workingmen's association.

The Manifesto begins with the statement that "The history of all hitherto existing society is the history of class struggles." This sets the tone of what follows, as a theorem in mathematics is followed by its proof. The casual reader of the Manifesto would be inclined to

JEAN JACQUES ROUSSEAU (1712-78). This French writer exerted unwitting influence on the Manifesto authors.

pass lightly on, and eventually conclude that a pretty strong case had been built up to support the opening statement. However, any mature, intelligent reader with an inquiring mind would stop in the very beginning and ask these questions:

1. Is this statement true and based on factual material?

2. Is my knowledge of history sufficient to accept or reject this statement?

3. Why was this statement made in 1848 by Marx and Engels?

4. Can a cause-effect relationship be established to explain in part what led to such a conclusion?

Answers to these questions inevitably lead to a better understanding of the Manifesto, as well as to an exposure of its inherent contradictions and its fallacies in logical and moral aspects.

GEORGE HEGEL (1770-1831). A German philosopher whose Hegelianisms affected Marx and Engels.

MANIFESTO
OF THE
COMMUNIST PARTY.

BY KARL MARX AND FREDERICK ENGELS.

A specter is haunting Europe—the specter of Communism. All the powers of old Europe have entered into a holy alliance to exorcise this specter; Pope and Czar, Metternich and Guizot, French radicals and German police spies.

Where is the party in opposition that has not been decried as Communistic by its opponents in power? Where the opposition that has not hurled back the branding reproach of Communism, against the more advanced opposition parties, as well as against its reactionary adversaries?

Two things result from this fact.

I. Communism is already acknowledged by all European powers to be in itself a power.

II. It is high time that Communists should openly, in the face of the whole world, publish their views, their aims, their tendencies, and meet this nursery tale of the Specter of Communism with a Manifesto of the party itself.

SPECTER'S HERALD. First page of the 1898 edition. The book ended "Proletarians have nothing to lose but chains! Working men of all countries, unite."

Karl Marx was born in 1818, Friedrich Engels in 1820. For 100 years before their birth, the world had been witnessing some very significant changes in its political and social life. The Industrial Age had begun in Great Britain--James Watt invented the steam engine in 1769. The American Revolution had taken place. The French Revolution had begun with the capture of the Bastille on 14 July 1789, marking the end of the era of feudalism, and inaugurating a long, bloody, chaotic period in European history.

Napoleon had had his abortive fling and had been banished for the second time. Education had begun to move out of the monasteries which had

RESTRICTED

THIS PAGE IS UNCLASSIFIED

long held a monopoly, but was still open only to a select few who could afford it. Printing, although begun in Germany early in the 15th Century, was still in its infancy, requiring laborious hand methods.

MARX, ENGELS GOT THEIR IDEAS FROM ROUSSEAU, HEGEL

Unquestionably,the Eighteenth Century was a turbulent,dynamic period. It was fraught with uncertainties and broken traditions. It was a period that encouraged confused thinking. In this century lived Jean Jacques Rousseau (1712-78), the Frenchman whose works will be remembered mainly for inspiring the Romantic era in French literature.

Rousseau's mature life was that of a vagabond ne'er-do-well, happily flitting from one mistress to another, never seeming able to earn his own way, and occasionally giving vent in his writings to his restlessness of spirit. His journeys into the field of philosophy are remembered chiefly for their eloquence of presentation rather than their logic and reasoning. However,his "Du Contrat Social" formed much of the basis for the Declaration of the Rights of Man and of the Citizen, which was drafted by the irate French citizenry after the fall of the Bastille.

Rousseau advanced the theory that man was perfect by nature, and whatever imperfections existed were due to the economic system.

In this era also lived George Wilhelm Hegel (1770-1831), born in Stuttgart, Germany, of well-to-do parents. Hegel's entire life was that of a scholar of cloistered, academic existence. Exceptionally well-educated and majoring in theology, he achieved great fame as a philosopher. His logic was the first to rival the logic of Aristotle, who was the apostle of the theory of demonstrative reasoning. Hegel's philosophy, known as "Idealism," interprets all material existence as the manifestation of an ideal.

The doctrine of materialism is antagonistic to all religious systems. It rejects the belief in a future life, it advocates fullest use of opportunities of the present life without regard to the possibility of any other, and argues that the ultimate reality in the universe is matter.

Rousseau and Hegel strongly influenced Marx and Engels, who were educated in Germany when Hegelianism was at its peak. In Hegelian dialectics they found a motivating force for the previous philosophies of materialism, to which Rousseau had made contributions.

THE LIVES AND TIMES OF MARX AND ENGELS

Marx and Engels were exceptionally well educated for their times. Marx' father was a respectable Jewish lawyer, and Engel's father was a wealthy manufacturer. After receiving his degree as doctor of philosophy at the age of 23, Marx seems to have been unable to adjust himself to the life of the times. The evidence indicates he became a frustrated intellectual, unable to make his own way, dependent on his friends for financial assistance. As is often the case, it would appear that his failure as an individual caused him to reject individualism; that his loss of faith in himself as a man caused him to pin his faith on some remote mass of men, possibly as a substitute for his discarded God.

Unlike Marx, Engels appears to have been wealthy enough throughout

RESTRICTED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

his life to indulge his fancies and test his philosophies. The income which permitted this indulgence was derived from a system which he did his utmost to destroy.

When the Manifesto was published, Marx was immediately exiled from Germany as a traitor to the government. He took refuge in England, where he stayed until his death in 1883. Engels was somewhat more fortunate. He escaped the wrath of the government since he was managing one of his father's mills in England at the time.

It is certainly significant that both of these men were given asylum in a country whose philosophy of government granted individual freedom of expression that could not be found elsewhere in Europe at that time.

Thus we see that the Manifesto was not solely the product of Marx and Engels. It was a product of the turbulent times of the eighteenth and nineteenth centuries: of Rousseau, a ne'er-do-well; Hegel, a cloistered scholar;Marx, a frustrated intellectual; and Engels, a wealthy dilettante.

In the Manifesto we may see the influence of confused, unobjective thinking resulting from (1) a turbulent historical environment, (2) a rejection of Christian concepts, and (3) rejection of the idea of the dignity of man as an individual. With this understanding, then, it is not surprising to discover that the Manifesto is a harsh, shrill diatribe against the existing economic system aimed at proving its opening statement that "The history of all hitherto existing society is the history of class struggles."

Also, it is not startling to discover that the central theme of the Manifesto is revolution--the overthrow of the existing order by violence and the raising of the working class to the position of ruling class.

HOW TO CONDUCT A REVOLUTION

The actual statement of concrete demands in the Manifesto occupies less than 3 percent of the 15,000-word text. These demands are quoted herewith verbatim:

"We have seen above that the first step in the revolution by the working class is to raise the proletariat to the position of ruling class, to win the battle of democracy.

"The proletariat will use its political supremacy to wrest, by degrees, all capital from the bourgeois, to centralize all instruments of production in the hands of the State, i.e., of the proletariat organized as the ruling class; and to increase the total of productive forces as rapidly as possible.

"Of course, in the beginning, this cannot be effected except by means of despotic inroads on the rights of property, and on the conditions of bourgeois production: by means of measures, therefore, which appear economically insufficient and untenable, but which, in the course of the movement, outstrip themselves, necessitate further inroads upon the old social order, and are unavoidable as a means of entirely revolutionizing the mode of production.

"These measures will of course be different in different countries.

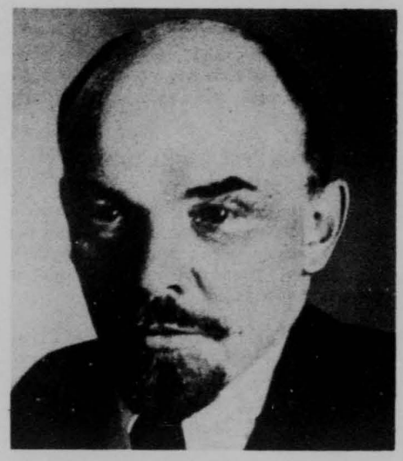
"Nevertheless in the most advanced countries the following will be pretty generally applicable:

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED



NICOLAY LENIN (1870-1924). The No. 1 man in the Red Revolution and first president of the U.S.S.R., this iron disciplinarian worked himself to death.

1. Abolition of property in land and application of all rents of land to public purposes.

2. A heavy progressive or graduated income tax.

3. Abolition of all right of inheritance.

4. Confiscation of the property of all emigrants and rebels.

5. Centralization of credit in the hands of the State, by means of a national bank with State capital and an exclusive monopoly.

6. Centralization of the means of a communication and transport in the hands of the State.

7. Extension of factories and instruments of production owned by the State; the bringing into cultivation of waste lands; and the improvement of the soil generally, in accordance with a common plan.

8. Equal liability of all to labor. Establishment of industrial armies, especially for agriculture.

9. Combination of agriculture with manufacturing industries; gradual abolition of the distinction between town and country, by a more equitable distribution of population over the country.

10. Free education for all children in public schools. Abolition of children's factory labor in its present form. Combination of education with industrial production, etc., etc."

It should be noted that many of these demands have long since been satisfied in nations outside the Soviet sphere, and without the influence of Communistic pressure. This leaves the principal remaining purpose of Communism as the violent and revolutionary elevation of the working class to that of ruling class.

MANIFESTO BECAME THE BIBLE FOR SOCIALISTS, COMMUNISTS

After the Manifesto was published in Germany in 1848,it was translated into many languages, and in time became the bible for Socialist and Communist movements throughout the world. The First International (1866-74) accepted Marx' program and prosecuted it vigorously, but met with more defeats than victories. It was the memory of those defeats that influenced the Second International (1882-1930) to pursue the more moderate course of seeking to gain its ends through constitutional rather than revolutionary means.

The revolutionary concepts of Marxism were revived by Nicolay Lenin, Leon Trotsky, and Josef Stalin. It was Lenin who introduced iron discipline within the Communist Party--discipline which demands blind loyalty and obedience. It was he who brought to the fore the differences between the Bolsheviks (majority) and the Mensheviks (minority), with the subsequent elimination of the Mensheviks.

Communism's development in Russia during the past 30 years is better known than Communism's early beginnings. Therefore at this point it is best to have a look at Communism in practice, keeping in mind the Communist theory that:

1. The history of all hitherto existing society is the theory of class struggles;

2. The immediate goal is world revolution by violent means to place the working class in the position of the ruling class.

Here it ought to be pointed out in letters 10 feet high that in the few instances in history where revolution has prevailed, seldom has the working class been elevated to the position of ruling class. More often, power has been seized by a group of shrewd, clever opportunists who represented themselves as "workers" and used power for their own advantage.

THIRTY YEARS OF THE SAME TACTICS IN THE UNITED STATES OF AMERICA

The pattern of Communist activity in the United States is so clear-cut that it has all the aspects of a shrewdly conceived and centrally directed campaign, which, of course, it is!

We look upon Communist activity as a threat which has only lately arrived in our midst. Actually, Communists have been boring away with gusto for a long time.

Some amazing revelations are contained in the Report of the Joint Legislative Committee Investigating Seditious Activities, filed on 24 April 1920 in the Senate of the State of New York. This report refers to the period during and immediately following World War I. We were concerned then over the lack of national unity displayed during the war, and were somewhat more fearful of the spread of Socialism than of Communism.

The 1920 report dwelt at length on Socialist activities and tactics. Nevertheless, if we were to go through

LEON TROTSKY (1877-1940). The top-flight organizer who believed in immediate revolution, fled Russia, found asylum in Mexico, was murdered there.

THIS PAGE IS UNCLASSIFIED

the report, and alter "Socialism" and "Socialist Party" to "Communism" and "Communist Party" we would find the report giving a reasonably accurate picture of conditions in the United States in 1949. Of course, we would have to add a brief account of the "boring-from-within" tactics, developed since 1920, used in institutions of public information and communication.

THE RED FLAME BURNS MORE FIERCELY

The main difference between 1920 and 1950 is that today we are up against a militant minority whose immediate goal is to seize power, by force if necessary. Thus, it would gain a position from which it can dictate the complete destruction of our way of life.

The Marxian doctrine announced in the Manifesto has exerted an enormous influence on the Socialist and Communist movements throughout the world. Many organizations have come into prominence as advocates of this doctrine. Most of these groups have masqueraded as political parties, Socialists, Communists, anarchists, syndicalists,laborites,etc.,throughout the world.

All these organizations have the same objective--overthrow of what they are pleased to call the "Capitalistic System." Each group differs only in the means and methods it advocates to accomplish its aims. Strongest of all are the Communists--mainly because of their complete control and domination of the USSR. They are the principal threat to the peoples of the Western Hemisphere.

Patterns of Communist aggression have become clearly discernable through the years. The primary targets have always been the labor unions of a nation. By infiltration methods, Communists gain membership in unions,and then proceed to undermine the workers' confidence in their leaders. Under the guise of improving economic conditions for the workers, they endeavor to maneuver themselves into control positions of the unions. Next, they make increasingly exorbitant demands of employers. They threaten strikes and civic disorder to the point of creating conditions that make impossible the conduct of business on a free-enterprise basis. Then the State is supposed to step in and take control.

Next targets of equal importance have been institutions of education and information, then the police and security forces, and finally, the government itself.

Since gaining complete control of the USSR,the Communists have exerted economic, political, and military pressure on other nations in which "boring-from-within" tactics have not achieved the desired results.

By threats of military force,either actual or implied, Communists in the USSR seek to cause other nations to maintain security forces so large as to be a severe strain and drain upon economy and national morale. In some cases, Communists support covertly armed rebellions to further their objectives.

In pursuing their aims, Communists openly espouse whatever causes seem popular with the masses at the moment,capitalizing wherever appropriate upon whatever flagrant differences may exist between rich and poor. They seek to gain positions of power and control which eventually lead to dictatorship and complete suppression of opposition. Basically, the issue can be drawn between Communism and those forms of society which are founded upon the dignity

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

of man as an individual; between revolution and evolution; between dictatorial leaders of an authoritarian police state and the leaders of peoples under a doctrine of freedom of choice;between atheism and religion.

Unquestionably, our purposes as a people and as a nation are in conflict with those of Communism. It is of little moment to dwell on the rightness or wrongness of a theory of philosophy when we are confronted with the urgent necessity of dealing with Communism in a practical way. It is no exaggeration to say that this problem is so momentous that we shall need to call upon all the powers of wisdom, logic, reasoning and clear objective thinking to arrive at a solution--for our future course as a nation, even our survival as a nation, hangs in the balance.

Air Intel Digest Feb 50 Uncl

JOSEF STALIN (1879-). Born Joséf Vissarionovich Vzhugashvili, Uncle Joe grew up with Communism, became a Bolshevik, saw the Czar of Russia fall, saw himself become more powerful than any Czar.

COMMUNIST OBJECTIVES

1. Hatred of God and of all religion (a real Communist has to be an atheist).
2. Destruction of private property and inheritance.
3. Absolute social and racial equality (excepting Commissars, officers and specialists, etc.); promotion of class hatred.
4. Revolutionary propaganda to stir up Communist and radical activities in order to cause strikes, riots, sabotage, bloodshed and civil war.
5. Destruction of all forms of representative or democratic governments, including civil liberties such as freedom of speech, of the press and of the radio.
6. The ultimate and final objective is by means of world revolution to establish the dictatorship of the so-called proletariat under the Red flag into one world union of Soviet Socialist Republics with the capital at Moscow.

NORTH TO EVERYWHERE

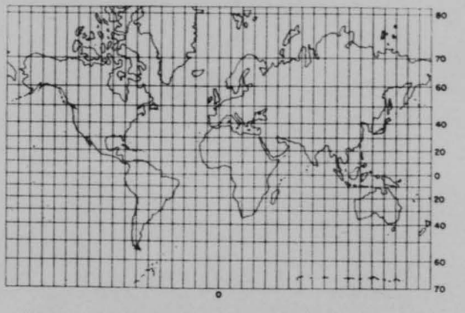
From an Original Article by Lt. Col. William R. Prince,
Instructor, Command and General Staff School

Forty years have elapsed since the Wright brothers made their historic flight at Kittyhawk. In those days, distances were great and the world was 25,000 miles around. To a farmer in Kansas, China was on the other side of the world and therefore must be 12,000 miles away.

Since that historic moment when the simple flying machine of the Wright brothers barely lifted itself above the sand dunes of the North Carolina coastline, developments have been such as to necessitate a complete re-orientation in our concept of world geography. We have been thinking so long in terms of east and west crossings of oceans and continents by ships, roads, and rail that it would take some time to accept what we have learned in the past few years--that the world is round in all directions.

Before long-range, pressurized stratoliners made their appearance, our idea of travel was as though the world were flat. The distance from Washington, D. C. to Moscow was 6,000 miles, from New York City to Tokyo 7,500 miles. Roads, railroads, and sea routes encircling the globe followed generally along parallels of latitude, or around its girth. They could not penetrate and cross over the formidable, frozen top and bottom sides of the world. The poles of the earth were the preserves of a handful of intrepid adventurers.

MERCATOR PROJECTION



MERCATOR PROJECTION. It is constructed by projecting the meridians and parallels onto the surface of a cylinder tangent to the earth at the equator.

The world was treated as a cylinder, the ends of which represented the north and south poles. We split this cylinder up one side, opened it out, and laid it flat. For millions of persons, this type of projection onto a flat surface is probably the most common geographic representation of the world. It has led to at least three widespread misconceptions.

One of these misconceptions pertains to distances. The distance between Washington and Tokyo laid off on a Mercator chart is about 7,500 miles, but if a string is stretched between these two points on a globe

RESTRICTED

1771

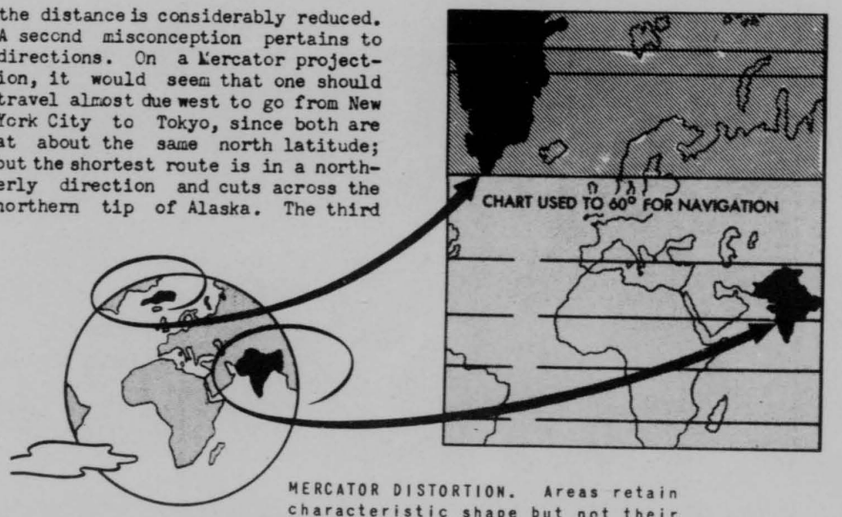
THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

the distance is considerably reduced. A second misconception pertains to directions. On a Mercator projection, it would seem that one should travel almost due west to go from New York City to Tokyo, since both are at about the same north latitude; but the shortest route is in a northerly direction and cuts across the northern tip of Alaska. The third



MERCATOR DISTORTION. Areas retain characteristic shape but not their proportionate size.

and probably greatest misconception pertains to distortion in size which occurs when we make a cylindrical projection of a sphere. On the Mercator projection, Greenland appears to be three times the size of Australia. Actually, it is but a third as large. A Mercator projection neglects the poles of the earth because the latitude of each pole, on such a projection, would equal infinity.

AIR AGE CHANGES

With the advent of the Air Age, the already recognized principle that a great circle is the shortest path between two points on the globe came into the realm of wide practical application. Air routes between two such points in opposite hemispheres, while seldom passing over the North Pole, nevertheless cut circles that fall well within the Arctic regions.

Why is the Antarctic excluded? Why should the same conditions not hold for the south polar regions as well? An inspection of a world globe will help supply the answer.

Approximately 70 percent of all the land area of the world lies north of the equator. Of the 30 percent in the southern hemisphere, a third is the vast, isolated, largely unexplored and uninhabited Antarctic Continent, and therefore only 20 percent of the inhabited land area of the world is south of the equator. Those land masses within the northern hemisphere include all of North America, Europe, Asia, two-thirds of Africa, and one-sixth of South America. Sixty percent of all the water area of the world is south of the equator. Figuratively speaking, then, the north half of the world is land and the south half is water.

The population distribution is even more radical and further accen-

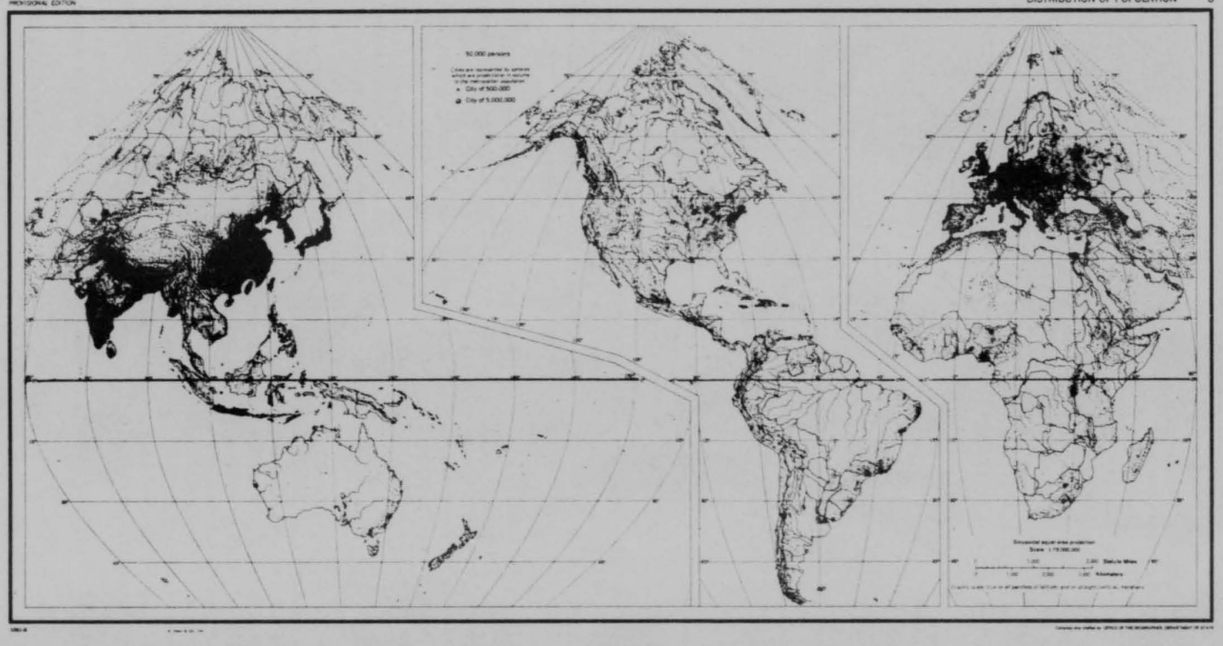
1772

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED



The blacked in areas illustrate that 90% of the world population is north of the equator. Note also that the vastly greater land mass (70%) is also in the northern hemisphere. Sixty percent of the water is south of the equator and 30% of the southern hemisphere is the largely unexplored and uninhabited Antarctica

RESTRICTED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

tuates this half land, half water concept. Ninety percent of the world's peoples are gathered within the northern hemisphere. Of the cities in which they live, 90 percent of all those having a population of 100,000 or over are north of the equator. By air, the capitals of all the great powers are closer to the Arctic Circle than they are to the equator. Mexico City and Chungking are both well within the northern hemisphere.

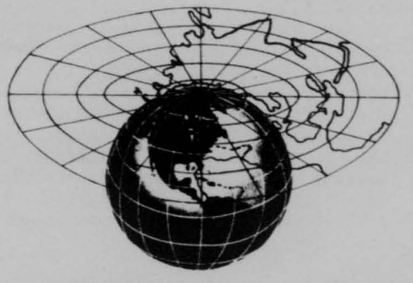
A climatological factor also favors the Arctic over the Antarctic. In general, the weather and climatic conditions over the Arctic are much less severe than those experienced on the Antarctic Continent.

These are the reasons why the aerial highways between the new and the old world will cut across the Arctic. Greeley's famous advice may well be revised to a modern phrase: "Go north, young man, go north!"

POLAR PROJECTION

Considering the world from an infinite distance directly above the geographic North Pole, we see that the pole is approximately at the center of the land masses of the world. A projection of the world, centered on the geographic North Pole, will supplant, in time, the more common Mercator chart as the familiar geographic face of the earth. The fulllimplication of a polar-centered world is not yet wholly appreciated. It will not be until commercial air transportation is fully developed.

The first thing that strikes one as he looks at a polar-centered map is that he is looking down into the center of an elongated body of water almost completely surrounded by land.



POLAR PROJECTION. Centered on the geographic North Pole, this type projection will in time supplant the mercator chart.

It has much the same general aspect as the Mediterranean Sea. Could this be the Arctic Ocean? It does look like an ocean on a Mercator map. Viewed in true proportion, as on a globe, it has more the appearance of a sea--the Mediterranean of the north, in the middle of all the land masses of the world and separating Eurasia from North America.

Little known yesterday, this sea is becoming a most important body of water. It is the only natural body of water which physically separates the two great land masses, Eurasia-Africa, and North America-South America--this by only the 50-mile width of Bering Strait. How many people realize that one may travel from the southern tip of South America to the southern tip of Africa, pass through five continents, and hardly see water?

THE ARCTIC OCEAN

Since the Arctic Ocean is destined to grow in importance in world strategy, travel, and trade, it would be of interest to explore it briefly.

The surface covers an area of

1774

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

about 5,500,000 square miles. This is five times the area of the Mediterranean Sea and one-twelfth the area of the Pacific Ocean. Its expanse is entirely contained within the Arctic Circle and its perimeter is 80 percent bordered by land. If the Arctic Ocean is considered to include all of the waters within the Arctic Circle, its length is close to 3,000 miles and its narrowest width is 1,200 miles.

The Arctic Ocean is neither an area of extremely low temperatures (minimum of -55F) nor of violent storms (55 miles an hour winds are rare). This degree of mildness, compared with the severity of the weather in the sub-Arctic, the Antarctic, and even in the North Temperate Zone, is due to the great body of water whose surface temperature is never lower than about 28F, since salt water will freeze below that temperature. The pack ice on top of this great mass of heated liquid acts as a great stove lid through which the heat underneath must come. As a consequence, the Polar Basin is much warmer than the surrounding sub-Arctic regions.

The main basin of the Arctic Ocean is quite deep. A sounding of 9,000 feet without bottom was taken by Robert E. Peary at the North Pole in 1909. The deepest soundings were recorded by George H. Wilkins in 1927, over 17,000 feet, 550 miles northwest of Point Barrow, Alaska.

PACK ICE

The principal characteristic of the Arctic Ocean is the pack ice which, even towards the end of summer, covers two-thirds of the surface. It has been variously described or imagined as a solid, homogeneous mass or cap, firmly and squarely implanted on the northern "top" of the earth. There is no vast expanse of solid ice or an ice cap as such, even at the North Pole. Admiral Richard E. Byrd gives the following description of the ice at the North Pole as he saw it during his historic flight on 9 May 1926:

"It did not look different from other miles of ice over which we had just passed. There was the same stretch of brilliant white marked by ridges, hummocks, and a few leads /open channels in the ice/ recently frozen, showing green against white. From pressure ridges, I knew that the ice there was in constant motion. The ice was composed of large cakes, of fields whose edges, except at the leads, jammed up against each other and were pressed so tightly by wind and ocean currents that ice and snow was forced up to varying heights, depending upon the pressure exerted. Cakes were glistening white with hummocks. Here and there on most of them, and on some drifts caused by strong winds, I knew the surface was more uneven than it looked from the plane. Floes were of many shapes and sizes, and pressure ridges ran willy-nilly, apparently without rhyme or reason."

When the large floes break up during the summer, they remain separate until autumn. As winter approaches, low temperatures begin to cement the floes together. Then, under the stress of wind, currents, collision with adjacent floes, and differential stress, leads form, exposing open water. In the winter, the open water in the leads freezes rapidly, cementing separate floes together and forming smooth, even surfaces. This process, together with the sluggish motion of the floes, makes it possible to travel over the ice with comparative safety during the winter, afoot or by sled. It was across such ice that Peary made his

1775

trip to the North Pole in 1909 from the north end of Ellesmere Island, a distance of 450 miles.

There has been much speculation as to the thickness of the pack ice. Estimations anywhere from 20 to 200 feet may be gained from reading some articles. The 20-foot ice is an exception, and 200-foot ice is never there except where ice is piled up against beaches and is jumbled up in great masses. The latter, however, is not to be pictured as characteristic of the entire sea. There is more substantial evidence of the average thickness of the pack ice of two famous drifts reported by ships: the Norwegian ship Fram (1893-1896), captained by Dr. Fridtjof Nansen; and a Soviet ice-breaker Sedov (1937-1940). Data compiled by the personnel of these two ships during the drifts indicates that in the 40-year period intervening between the two drifts the thickness of the pack ice had decreased by about 3 feet. The Fram recorded the normal ice depth as 10 feet, whereas the Sedov recorded a depth of 7 feet.

The ice of the Arctic Ocean is of two kinds: that type already described, which is constantly moving and has a natural drift in a clockwise direction toward an outflow between Greenland and Spitsbergen; and fast ice which is immobile and solidly anchored to the coasts. In the summer, the pack ice averages from 5 to 15 miles off shore and much of the fast ice disappears. Thus a relatively open water passage (shore lead) is provided for ships. However, due to the vagaries of the drifting ice floes, it is seldom that such passages can be navigated without the assistance of aerial ice reconnaissance and ice-breakers.

During the winter, the pack ice and the fast ice generally come together. Where the motion of the pack ice is rapid, as after a heavy gale when its speed may be 2 or more miles an hour, there is severe grinding of the pack along the edge of the land ice. The rending and crashing of the floes at such times is deafening.

TWO TYPES OF ICE. This illustrates the solid or "shore" ice, and the broken, moving, "drift" ice.

ARCTIC HISTORY

Although man has probably lived in the Arctic for as long as 500,000 years, our recorded knowledge of life there dates from relatively recent times. Pytheas, a Greek astronomer and philosopher, made the initial contribution in the fourth century B.C., when, after sailing 6 days north

MOTION OF DRIFT. The arrows show how the floes move clockwise to the outflow.

from Scotland, he found an island called Thule (Iceland). Proceeding north an additional day, he encountered much ice "through which the ship could not sail and which would not support man." Pytheas' brother philosophers gave him scant satisfaction in his contentions. They held to the then current belief that the frigid zone where Pytheas had claimed to have been would not support life. After Pytheas, there is little information on the Arctic until the colonization of Iceland by the Norsemen in the ninth century A.D. In 983, using Iceland as a base, Eric the Red colonized Greenland, and 17 years later, during a voyage from Norway to Greenland, he apparently missed sighting the island and is presumed to have made a landing on the coast of Labrador.

Following this discovery of America, there is another gap of several hundred years in the history of further Arctic exploration. It was not until 1576, with the first of three expeditions conducted by Sir Martin Frobisher, that Europeans again took an interest in the Arctic. Gradually, the value of the fur trade in the north and the desire to navigate a northwest passage to the

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Orient increased the number of expeditions and added to the knowledge of the Arctic. The great goal of being the first to reach the geographic North Pole resulted in a keen international competition and placed much emphasis on Arctic travel and exploration. The whaling industry brought many people to the Arctic, where numbers of them settled permanently after the industry declined. With the advent of the airplane, exploration and colonization of the Arctic lands received further impetus. A Russian, Lieutenant Nagurski, first successfully flew an airplane within the Arctic regions in 1916. Admiral Byrd made his famous flight over the North Pole 10 years later. Since that time, the USSR, Canada, and the United States have been in the forefront in carrying out many experimental and enterprising flights in, around, and across the Arctic. With the development of multi-engined, high-speed aircraft, Arctic flight is becoming commonplace.

FLYING CONDITIONS

It is a mistaken idea that flying conditions grow progressively worse the farther north one moves from the equator. Conditions do increase in severity from the equator until latitudes where annual mean temperatures around the freezing point are reached. In such localities are found dense fog, heavy, sticky snow, and freezing rain, all of which interfere with visibility and the aerodynamics of a plane. This area occurs within the North Temperate Zone and conditions result from constant variations in temperature. North of this zone and within the Arctic, however, flying conditions through the whole year are less difficult.

The stratosphere is above all weather, and therefore stratospheric flight over the Arctic will be similar to that over the equator, with one exception. The floor of the stratosphere decreases in altitude as one progresses north or south from the equator and continues to decrease until over the poles. Thus, while the stratosphere in northern North America may be entered at 20,000 feet, over the geographic North Pole it may be gained at 15,000 feet.

Besides our growing awareness of the short cuts offered by air travel across the Arctic, we are learning that the high-altitude flying weather in this region is equal to or better than that of any other locality in the world. Before full use can be made of these dual advantages of distance and weather, advance operation bases, strings of radar and loran stations across the Arctic, and weather stations are needed for flight control and for safety.

The comparative safety of air travel over the Arctic Ocean, in contrast to other great bodies of water, is high-lighted by Vilhjalmur Stefansson in his discussion of the fate of an attempted transpolar flight by Russian aviator Levanevsky in 1937. Stefansson wrote:

"Levanevsky was assumed to have made a forced landing on the polar sea. Therefore, we consider the various oceans, how they compare for the safety of forced landings. Most flyers who have come down on liquid seas far from land and beyond sight of a vessel have been lost. All have been lost who made forced descents beyond the sight of rescuers in a gale.

"Before the Levanevsky flight, there had been perhaps a dozen forced landings on the frozen sea. Some

1779

THIS PAGE IS UNCLASSIFIED

EMERGENCY LANDINGS. Smooth surfaces of off shore ice packs provide emergency landing fields.

were in good weather, some in falling snow, some in blizzards, and one in a combination of a gale and the darkness of night. All these had been safe descents--nc lives had been lost and there had been only minor injuries to planes. The flyers were always saved in one of three ways: they made repairs and flew again; they were rescued, by plane or ship; or they abandoned their plane and walked ashore.

"Take specifically for the North Atlantic the entire period from its first crossing by the United States Navy airplanes in 1919 to the beginning of survey flights by Pan American Airways and Imperial Airways in 1937. During this period, atleast 19 ocean descents were made in all weather from calm to gale. Nine planes were lost. The people saved were mostly those who had specially good luck, as coming down in fairly good weather either within sight of a ship or after being able to communicate to a nearby ship through radio an approximate position of their descent.

"During the same period, more than 90,000 miles were flown over the polar sea. There were at least 56 voluntary and forced descents in all weathers from calm to gale (not all Soviet figures are available). No lives were lost from any of these descents."

The importance of the Arctic to air travel is obvious. Less obvious is the importance of the polar sea as a navigable body of water.

SUBMARINES

The problems involved in traversing the Arctic Ocean beneath the polar ice pack with a submarine are serious but not insurmountable. The first experiment of this type,made in 1931 by George H. (Sir Hubert) Wilkins in an attempt to reach the North Pole, ended in failure. The submarine Nautilus, formerly the USS O-12, was obsolete; despite extensive alterations and modifications designed to cope with expected conditions, she was no match for the ice. Time, 14 September 1931, describes the plight of the Nautilus at the conclusion of her venture in these words:

"They rammed their ice-borer, which was to give them escape if they were gripped under the ice, against an ice chunk and smashed it. Ice crushed the runners atop the Nautilus, which were to enable her to slide against the underside of ice fields. She sprang two leaks,

RESTRICTED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

became miserably dank within. The propeller edges became saw-toothed and bent, grinding against small ice."

The position of the Nautilus at the conclusion of this experiment was north of Spitsbergen and about 400 miles from the North Pole. Despite her severe mauling, she had submerged and navigated beneath the Arctic ice pack.

The modern submarine, with high submerged speed and capabilities of long submersion and great diving depth (nearly 1,000 feet in the experimental dive made by the French with one of the type XXI German submarines) could cross the Arctic Ocean at its narrowest width in less than 48 hours.

A new and more sensitive sonar gear would keep such a submarine constantly aware of its position in relation to the ice ceiling and ice tongues extending down into its path. Such gear would also locate areas of open water in the ice pack, into which a submarine could surface. Submarines in the Arctic in peacetime would be useful as weather stations, radar picket vessels, and loran and aircraft beacon stations. Their strategic importance in war is obvious.

The fact that the shortest airline and water distances between the major land masses of the northern hemisphere are across the Arctic is alone sufficient to give strategic importance to the area in future global war. Strategically, Alaska, Greenland, and the Islands of the Canadian Archipelago are the first line of North American continental defense. Development of these areas in peacetime will enhance their value in war.

DEVELOPMENT

Great changes are taking place in the general methods of Arctic exploration and development. Side by side with private enterprise, governments have already begun to open up and exploit the northern lands which belong to them. The search for uranium, oil, and iron ore, as well as for natural waterways along the northern shores of North America and Asia, are speeding this work. These vast areas, woefully lacking in overland travel facilities, have been knitted more closely together by air services which connect their remote communities. The Arctic is destined to play a leading role in the coming age of long range aviation. Most of the great commercial air routes of the world will have to cross the Arctic at one place or another. Air travel will lead to modern airports with all facilities for the comfort and convenience of the traveller. Eventually, the heretofore forbidding polar ice will serve the needs of civilization, by providing emergency landing fields and by supporting portable directional finding stations and light beacons which will chart unerring courses over the Arctic Ocean.

The ultimate passage to the Orient is aerial. The short cut from New York to Tokyo is via Hudson Bay, the Barren Lands of the Northwest Territories, and Alaska. The shortest distance from Chicago to Calcutta is straight north. In short, travel tomorrow will be North to Everywhere!

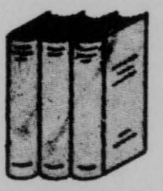
THE BOOK SHELF



RECOMMENDED READING FOR YOUR OFF DUTY HOURS

TITLE: Rumania Under The Soviet Yoke

AUTHOR: Reuben H. Harkham

PUBLISHER: Meador Publishing Company, Boston

This book, by a journalist with many years experience in the Balkans, describes what happened to Rumania when it was taken over by a communist minority. There is a review of the background of the Rumanian nation and people and a detailed account of the tangled events in the country during World War II. The major portion of the book, however, deals with events around March 1945, when the Rumanian government was handed over to four communists. Only 5 years before, the communist party had numbered only 1,000 in a country of 20 million inhabitants. The book records the religious persecution suppression of minorities, subjugation of Rumanian nationality, and terror that had been Rumania's experience through 1948.

TITLE: The United States in World Affairs, 1947-1948

AUTHOR: John C. Campbell

PUBLISHER: Harper & Brothers, N.Y.

Recent world events as they have affected the United States form the substance of this volume. The second of two volumes prepared by the Council on Foreign Relations since the end of World War II, the present book covers the period from the spring of 1947 to the spring of 1948. Here the reader will find much on the widening breach with Russia and the crisis that has developed in the United Nations. Among other subjects, the author covers the Truman Doctrine and the Marshall Plan, Germany, Japan and Korea, and Asia. One chapter deals with inter-American affairs.

TITLE: Western Union. A study of the Trend Toward European Unity.

AUTHOR: Andrew and Frances Boyd

PUBLISHER: Public Affairs Press, Washington, D. C.

In view of the many recent steps that have tended to draw the nations of Western Europe closer together, this book is quite timely. The two British authors give a survey of the condition in which Europe finds itself after World War II, and they sketch the various early attempts to unify Europe. One chapter deals with recent developments such as the Marshall Plan, economic union, defense measures, and the various influences of the United Nations on Europe. The book covers events into 1948, and it thus stops short of the creation of the Council of Europe on 28 January 1949.

SECURITY QUIZ

SAFEGUARD MILITARY INFORMATION

Paragraph 4b, AFR 205-1, squarely places on the individual the responsibility for safeguarding classified military information. Thus it is not a case of letting the other fellow worry about it, but a case of each of us being security conscious at all times. The overworked adage still hold true--"a cha in is only as strong as its weakest link."

What is your strength in this chain? Here is a test of your knowledge of security matters. References shown after each question apply to paragraphs in AFR 205-1. Are the statements true or false? Jot your answers on a piece of scratch paper so as not to spoil the test for the next man.

After you have taken the test check your answers on page 44, taking two points for each correct answer. Are you a good security risk?

1. Security is the protected condition of classified matter which prevents unauthorized persons from obtaining information of direct or indirect military value. (Par. 2-r.)
2. Military information is ALL information under the control and jurisdiction of the Department of the Air Force or of primary interest to it. (Par. 2-l.)
3. In transacting official business, any type of restricted message may be read verbatim over the telephone to a person authorized to receive such information. (Par. 6-b.)
4. Downgrading is the lowering of classification of classified matter, including canceling the classification when appropriate. (Par. 2-h.)
5. The discussion of classified military information, either public or private, with or in the presence or hearing of any person not authorized to have knowledge thereof, is strictly forbidden. (Par. 6-a(1).)
6. When classified military information is discussed with persons who are subject to military law or employed within the National Military Establishment, they will be informed of its classification. (Par. 6-a(3).)
7. Top Secret, Secret, and Confidential information will not be discussed over the telephone. (Par. 6-b.)
8. When the notation "Paraphrase not required" appears on a restricted message, information included in the message may be discussed over the telephone. (Par. 6-b.)
9. Matter may be classified Top Secret or Secret only by specially designated persons. (Par. 5.)
10. Service magazines, journals, and newspapers will not contain classified military information. (Par. 6-e.
11. Classified information may be included in personal correspondence. (Par. 6-c.)
12. Classified documents which have been rescinded or superseded will be afforded the protection required for their category until destroyed. (Par. 6-h.)
13. Officers are entitled solely by virtue of their grade to knowledge or possession of classified matter. (Par. 7.)
14. Classified matter will be reproduced only when necessary to satisfy military or other official governmental requirements. (Par. 11.)
15. Upon change of duty assignment or separation from the Military Service, each individual will return to the source from which received or to his commanding officer or otherwise properly account for or transfer all Top Secret, Secret, and Confidential documents and all Restricted registered documents issued to him. (Par. 12-a.)
16. Top Secret and Registered matter may be stored in steel file cabinets secured by a steel bar provided the padlock is of a three-combination dial type. (Par. 13-a.)
17. Material classified Restricted and not registered will be stored in a secure manner as determined by the commanding officer of the installation where stored. (Par. 13-c.)
18. Safe combinations and combination padlocks used to lock containers holding Top Secret, Secret, Confidential, and registered Restricted material will be changed at intervals not exceeding six (6) months. (Par. 13-e.)

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

19. All persons holding or otherwise having custody of classified matter will make a daily inspection to insure that such material is properly stored. (Par. 13-g.)

20. The storage space containing registered cryptomaterial will be kept locked with the full combination when not under the direct supervision of cleared personnel. (Par. 13-b(3).)

21. TOP SECRET, SECRET, and ALL Registered Documents, when destruction is authorized or directed, will be burned by the custodian in same manner as required for nonregistered Restricted documents. (Par. 14.)

22. Carbon sheets, stencils, and stenographic notes containing classified matter, will be given the same classification and safeguarded in the same manner as the material produced from them when awaiting action to be destroyed. (Par. 14-f.)

23. Any person who may have knowledge of the loss or subjection to compromise of classified matter will promptly report such facts to his immediate superior. (Par. 15.)

24. Information and material, the unauthorized disclosure of which would endanger National Security, cause injury to the interest or prestige of the Nation, will be classified as Top Secret. (Par. 20.)

25. Information and material, the security of which is paramount and the unauthorized disclosure of which would cause grave damage to the Nation, will be classified as Secret. (Par. 21.)

26. Information and material, the unauthorized disclosure of which would be prejudicial to the interests or prestige of the Nation, will be classified as Confidential. (Par. 22.)

27. Information and material, the unauthorized disclosure of which would be of advantage to a foreign nation or would cause unwarranted injury to an individual, will be classified as Restricted. (Par. 23.)

28. Each document or other item, including extracts from classified documents except messages, will be graded according to its own content and not necessarily according to its relationship to another document or item. (Par. 25.)

29. The grading of a file or group of physically connected documents will be that of the highest classified document therein. (Par. 25-c.)

30. Only the authority making the original classification or the authority that has succeeded or assumed the functions of the original authority which no longer exists or higher authority in the same chain of command, may cancel the classification of a document or article of materiel. (Par. 27.)

31. Previously cryptographed messages may be downgraded to Restricted without paraphrasing by the proper authority when the subject matter permits. (Par. 27-c(3).)

32. It is the responsibility of all authorities to review continuously all classified matter of current interest in their possession, and to downgrade, or initiate action to downgrade, as soon as conditions permit. (Par. 27-c(1).)

33. Classified books or pamphlets, the pages of which are permanently and securely fastened together, need not be plainly and conspicuously marked or stamped Top Secret, Secret, Confidential, or Restricted at the top and bottom of each page. (Par. 28-a(1).)

34. Classified correspondence not permanently and securely fastened together will be marked or stamped, not typed, with the appropriate classification at the top and bottom of each page. (Par. 28-a(2).)

35. All Top Secret and Secret matter will show the authority for the classification, the initials of the classifying officer, and the date the classification is affixed. (Par. 28-c.)

36. Downgraded documents will be marked or stamped with the new appropriate classification in the same manner as originally classified documents. (Par. 28-d.)

37. When a document has been downgraded, bulk files or supplies thereof need not be marked immediately with the new classification. (Par. 28-d(3).)

38. Commanders of headquarters who initiate, receive, or process Top Secret material will establish and maintain a system for the control and secure handling of such material within their headquarters. (Par. 29-a.)

39. Top Secret Control officers will open the inner envelope of Top Secret correspondence before delivery to an individual addressed by name. (Par. 29-b(7).)

40. It is mandatory that transmission and custody of Top Secret matter, except within a headquarters, be covered by a receipt system. (Par. 29-b(4).)

41. Commanders will maintain a list of all persons within a headquarters who have access to a Top Secret document or to whom Top Secret information is disclosed. (Par. 29-b(1).)

42. In emergencies, Top Secret matter will be transmitted by mail channels. (Par. 29-b(8).)

43. Top Secret correspondence may be transmitted by registered mail within the continental limits of the United States. (Par. 29-b(8).)

44. Accompanied State Department diplomatic pouch will be used exclusively for transmission of Top Secret matter through or within a neutral country. (Par. 29-d(2)(b).)

45. Within a headquarters, transmission between major headquarters offices of Secret material will in all cases be covered by a receipt system. (Par. 30-a.)

46. Only the addressee or his duly designated representative will open inner covers or envelopes marked Secret. (Par. 30-b(2)(a).)

47. Secret matter will be prepared in the same manner for transmission as all Top Secret matter. (Par. 30-b(3).)

48. Nonregistered Confidential matter will be handled and transmitted in the same manner as prescribed for Restricted matter. (Par. 31-a.)

49. Confidential Registered matter will be handled and transmitted in the same manner as prescribed for Top Secret matter. (Par. 31-d.)

50. Restricted Registered matter will be handled and transmitted in the same manner as prescribed for Secret matter. (Par. 32-c.)

Sentinels of

UNITED STATES FOREIGN POLICY

An Adaptation of an Article by
Major John D. Reid

The coming of age of Air Power and its resultant importance to our national security dictate that the United States Air Force continually review its basic planning and precepts in the light of changing domestic and international situations. The Air Force must periodically inventory its ideas and ideals, discarding those which have withered and become useless. It must understand its major responsibilities for the national welfare. It must adopt and pursue definite and proclaimed policies which relate to its peacetime role.

On the surface this problem has an easy solution: the Air Force must attain and maintain a state of readiness for war. This is a bona fide mission, yet the simplicity of its statement may obscure an equally important responsibility of the nation's air arm--that U.S. Air Power will exert a marked influence on the attainment of a stable and durable world peace.

Actually the Air Force has already underwritten, perhaps unwittingly, its aspirations to participate in the forging of world peace. "Air Power is Peace Power" is prominently displayed on recruiting posters. It is broadcast on the radio and spread in the press. As a public relations slogan to stimulate enlistments, this claim is undoubtedly intended to serve a purpose. But the thought occurs that we may have coined a phrase which portends events of far deeper significance. "Air Power is Peace Power" can conceivably be a belief, rather than a short-range recruiting slogan. There are definite indications that U.S. Air Power is destined to bulwark our peace aims and to buttress our foreign policy in search of world peace. The successful application of Air Power to the Berlin crisis shows that U.S. foreign policy even now has a new bodyguard.

In all likelihood this proposed association of Air Power and foreign policy needs little clarification

RESTRICTED

THIS PAGE IS UNCLASSIFIED

for the student of world power politics. On the other hand there is little evidence of any widespread belief that the Air Force is more than an inert force in the absence of war. Basically this stems from a lack of what constitutes p e ace. Certainly the complacency of the amity-loving nations in the interval between the two World Wars did not achieve a true peace. Nor can the tremulous aftermath of World War II be appraised as a tranquil era. This nation is commencing to realize that the absence of a shooting war, in itself, does not presage c on cord. Postwar events have demonstrate d that peace is every bit as dynamic as war.

U.S. foreign policy is our official long-range plan for international relations. It is basically oriented toward the goal of peace. In an address at Washington in 1938, Cordell Hull, then Secretary of State, proclaimed that "The primary objectives of our foreign policy are the maintenance of the peace of our country, and the promotion of the economic, the social, and the moral welfare of our people." Events since then have proved that no proclamation of foreign policy will stand a reasonable chance of fulfillment unless backed by sufficient national power to give authority to the assertions of that policy. We cannot therefore lightly dismiss the U.S. power position in peace calculations, nor by the same token can the Air Force ignore its responsibilities in support of that position. Ex-Justice Roberts is reported to have said that the law of nations "is the law of tooth and claw." This is not a dainty summation of international politics,but in the absence of aggressive peace measures it has always proved tragically exact. We must, therefore, understand the urgency of wedding our foreign policy to a power guardian. General Marshall's final report to the Secretary of War phrased this thought as follows: "We must, if we are to realize the hope we may now dare have for lasting peace, enforce our will for peace with strength." But if U.S. Air Power is required to support U. S. foreign policy in a crusade for peace, the formalized concept of the Air Force mission as that of maintaining combat readiness must be closely examined to insure direct support of the peace campaigns.

In pursuance of this concept of important corollary of the over-all problems presents itself. This problem concerns the proper deployment of U.S. Air Power. As a force for the attainment of peace the Air Force must consider its dispositions from a standpoint other than that of operational deployment. Thus the important issue of strategic air bases arises. The duality of Air Force responsibility,in other words, requires a study of the political deployment of the nation's Air Power.

The prospect of acquiring and

1786

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

maintaining strategic air bases cannot have widespread appeal, either to the nation's taxpayers or the airmen who must man them. Major Alexander P. de Seversky, in his treatment of victory achieved through the application of Air Power, scoffs at air bases as a future requirement, maintaining that future increases in aircraft range will make them unnecessary. It takes little imagination to visualize that elimination of these bases would relieve the Air Force of grueling logistics and security measures for their continued use. Indeed one can elaborate and, with the mathematical devices of the aircraft designers, prove that the globe-circling aircraft of the future is nearing reality. If, however, the concept of Air Power as a dynamic peace power is valid, the political value of strategically located bases and their effect on foreign policy cannot be ignored. Enthusiasts of long-range aircraft who foresee that Air Power can be applied from national confines cannot be entirely refuted, nor is that the primary purpose of this article. Rather, laying aside the operational capabilities of bases in war, we shall limit the discussion to assessment of the value of strategic air bases to the successful accomplishment of U. S. foreign policy aims.

Any treatment of strategic air bases evokes immediate speculations on possible locations. The embroilment of power instruments in geopolitical actions is expressed by Nicholas J. Spykman in "America's Strategy in World Politics:" "Power is effective in inverse ratio to the distance from its source." His statement may be modified to the effect that useful power must also be in proximity to the sovereignty or area against which it is applied. At any rate, we must carefully weigh the prospects of enhancing or diminishing the power/source ratio by the acquisition of foreign bases.

Admittedly any plan on the part of the United States to lease, buy, or otherwise acquire strategic air bases is fraught with both domestic and worldwide implications. Yet the political advantages which these bases might present to a firm, well-defined national foreign policy deserves careful scrutiny. To forecast these advantages, a brief insight into a historical precedent may be of value.

In the period which followed the Napoleonic Wars, Great Britain embarked on a remarkable program of overseas expansion. This program seems to have been impelled by three forces. The first was a desire for national economic betterment; the second, a formula for maritime dominance which could guarantee the success of her economic enterprises; and the third, an astute foreign policy closely attuned to the limitations and capabilities of sea power. To represent this program as foreordained or preplanned in all its details is to indulge in fantasy. On the contrary the formula which ultimately spelled British world prominence was a combination of sagacity and good fortune. Nevertheless Britain's ascendency in the economic, naval, and diplomatic fields deserves close attention for the value which may be derived in prophesying a course of action for the United States. In particular a valuable lesson can be gleaned from certain matters pertaining to the alliance of British foreign policy and naval bases.

Long before formal treatises appeared on the subject, the British had sensed the importance of geopolitics and were obtaining strategic vantage points about the world upon which to pivot or concentrate their superior naval power. Dr. George T.

1787

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Renner, author of "Geography in the Air Age," stresses the importance to the world a century and more ago of "ocean-basin geography," this in a time when maritime power connoted a secure power position for a nation possessing strong naval forces. The concept of ocean-basin geography inspired Britain to obtain local control of vital areas which served as stoppers or bottlenecks on the high seas. At the peak of her power Great Britain controlled Singapore, Capetown, Hong Kong, Gibraltar--in fact, all the major bottlenecks except the Panama Canal. These focal points, when converted into naval bases, guaranteed economic development of the adjacent areas and reminded neighboring governments that British policies could be ignored only at the risk of forceful measures.

There are certain aspects of this period of Britain's history which should be noted. In the first place she strove to improve her relative power position through the employment of a firm foreign policy. In addition she utilized a display of naval bases, not only for their potential value to her fleet but also as visible reminders, in the absence of that fleet, that her proclamations were to be reckoned with. For those who may resent such power moves, another statement by Mr. Spykman is apropos: "In a world of international anarchy, foreign policy must aim above all at the improvement or at least the preservation of the relative power position of the state."

Finally, and this is most important, it must be noted that the British strategy of bottleneck bases belies the impression that her ultimate aim was a world balance of power. She subscribed to a balance of power only as it pertained to the affairs of continental Europe. This was occasioned by an awkward geo-political situation. In effect Great Britain could not in the nature of things pit her sea power directly against the resurgent land armies of Europe. Britain's worldwide aim was a "margin of power." Spykman notes that a nation must attain a balance of power which affords freedom of action. In a sense this was true of the British policy, since she enjoyed a freedom of action resulting from the delicate power balance in Europe which willed her a margin of power elsewhere in the world. In short the realistic British foreign policy, while cognizant of the balance-of-power policy as unsuitable to real world stability, was forced by the physical dispositions of Europe's power states to make the best of a bad geographical bargain, to be content with forces in precarious balance on the Continent; and to promote a preponderance in the other world areas.

It is fully realized that this historic era of British foreign policy backed by strategic naval deployment, while remarkably foresighted, was not created in the hope of attaining world peace. Britain was primarily concerned with her economic development. Nevertheless her role as a world stabilizer is profoundly significant, if we are to plan for the proper utilization of our Air Power in support of a rejuvenated and statesman like U.S. foreign policy. Historians have termed the era of Great Britain's world leadership "the Pax Britannica." The stability of those times is a goal more likely to be wished for than achieved in the near future, but it is a worthy aim for our country, which has succeeded to the position of leadership previously held by Great Britain.

This historic example of astute foreign policy, coupled with a display of power at scattered vantage

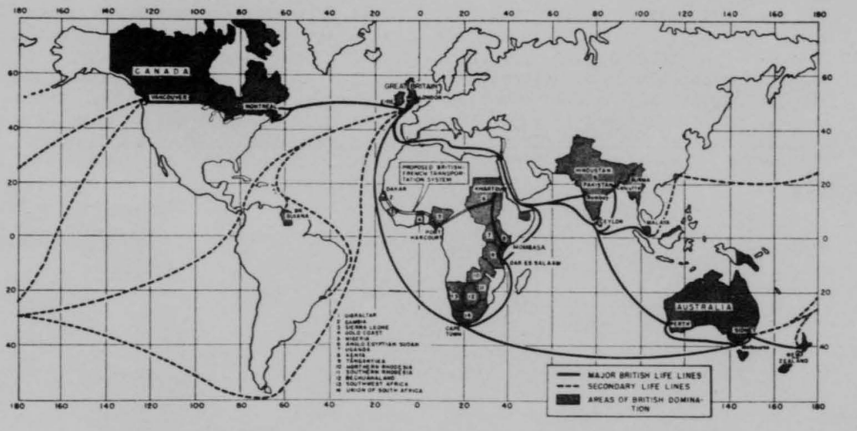
THE BRITISH COMMONWEALTH - EMPIRE



points, has set a recognizable pattern for the United States. In certain respects our moral position in promoting a similar alliance of air bases and foreign policy is undoubtedly more secure. For example, the United States could not reasonably be accused of the economic ruthlessness of which British expansion was accused. In place of economic betterment our position adheres to the basic aim of preventing wars which may become so destructive as to render it impossible to distinguish the victors from the vanquished in every aspect save perhaps the official proclamation of surrender. The basis of our foreign policy is a desire for world peace. The deployment of our Air Power is important for its influence in the attainment of that desire.

The sound geopolitics of British naval bases in the dominant period of sea power logically brings forth the question of the geopolitical implications of strategic air bases. It can be reasoned that any answer to this question must be predicated on at least the rudiments of geopolitics in the air age. A point of departure, then, is the kinship of Air Power and geopolitics.

One of the earliest proponents of geopolitics, Sir Halford MacKinder, compiled a memorable thesis to forecast the tribulations which would confront the British Empire in the twentieth century. MacKinder foresaw that nineteenth century maritime power could be topped by land power, which would become more mobile as railroads and modern transportation developed. He held that the key to world dominance would some day be lodged in eastern Europe and that enlargement of the eastern European power position could lead to control of the land mass of Europe, Asia, and Africa--the "Heartland." Events have never completely confirmed his beliefs, but it is certain that his theories influenced German political thought and military planning prior to the last war. Although the Nazi strikes into Africa and eastern Europe were only transient, it was increasingly clear in the dark hours

1789

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

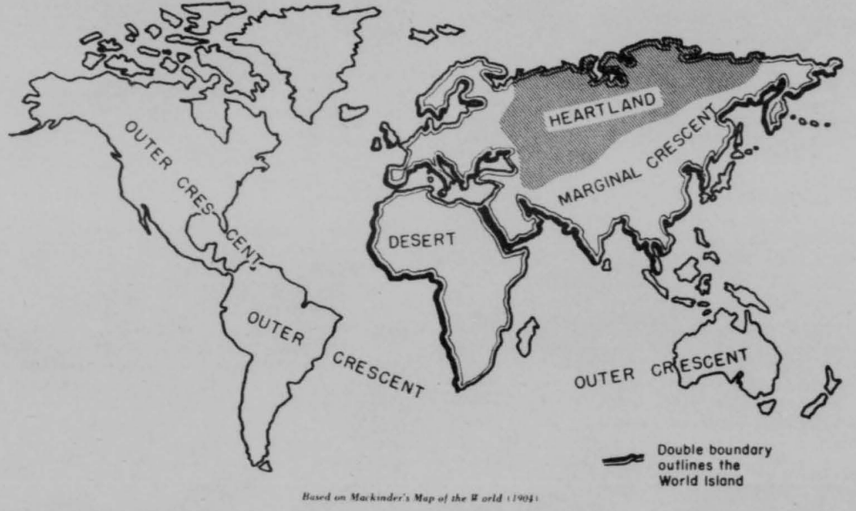
THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

of those conflicts that consolidation and exploitation of the positions then held would inevitably reduce the Western Hemisphere, Australia, and other isolated land areas to impotent segments of the earth's surface.

MacKinder, however, did not include Air Power in his calculations; indeed, current geopolitical thinking has thus far tended to skirt the air factor. The Reverend Edmund A. Walsh, a prominent geopolitician, asserts that Air Power modified but does not cancel out the heartland theory. This position is taken by another authority, Burnet Hershey, who declares that, "Russia, (the present dominator of the heartland) from every point of view, has the strongest air position in the world today." His remarks were not specifically propounded in consideration either of military strategy or foreign policy matters, since they dealt primarily with the commercial aspects of international aviation. Nevertheless the eastern European area lies strategically athwart air routes almost as prominently as it dominates large land areas and sensitive land routes.

Bearing in mind, therefore, that the United States is not geographically the most favored nation for the application of Air Power and recalling that Britain's strategy against the European land mass featured an encirclement with world bases upon which to pivot or concentrate her mobile naval strength, it becomes clear that a similar strategy for the U.S. may be geopolitically desirable if not absolutely necessary. We must assess the wisdom of undermining our less favorable aerogeographical position by a withdrawal to the bases within the national and territorial boundaries, since thereafter, we should have to rely upon publicizing technological advances in aircraft range and performance to compensate for less effective deployment. This course of action, it appears, would relegate our Air Power to the status of a war



Based on Mackinder's Map of the World (1904)

weapon. It would display that we did not intend to use this important instrument of power in direct support of peace by the prevention, rather than the winning of any possible future war.

A deployment of Air Power for geo-political advantages, it must be recognized, is in itself only the means to an end. It would be foolhardy to deploy in such wanton fashion as to leave a nation's air arm without cohesion and warmaking capability. The problem, as stated previously, is to deploy in such a manner as to lend political stamina to peace aims of our foreign policy. This need not entail dangerous dispersion. On the contrary, if hostilities should occur, it is conceivable that at least some of the bases held would be tenable and of operational value.

The role of foreign policy is not difficult to understand. Foreign policy expresses the collective will and desires of the nation in matters pertaining to other nations. Mr. Joseph Jones, Associate Editor of Fortune and former State Department officer, has declared that foreign affairs "are American affairs in which we admit that foreign countries have a legitimate interest; and they are affairs of foreign countries in which we claim to have a legitimate interest." A familiar promulgation of U.S. foreign policy is the Monroe Doctrine, the capstone of U.S. foreign affairs for almost a century. Its phraseology tacitly admitted that other nations had a legitimate interest in American affairs by virtue of their New World colonies. Conversely the Monroe Doctrine recognized the legitimate interests of the United States in forbidding further New World colonization.

Serious accusations have been leveled against modern U.S. foreign policy. Walter Lippmann holds that our Twentieth Century foreign policy has largely been insolvent. Many claim that all too frequently it has been compounded of wordly principles and simple expediency, facts which have befuddled not only the U.S. public but also foreign statesmen seeking to align the destinies of their nations with those of this country.

Granting the absence of a clearcut, long-range foreign policy for the future, it is, however, indisputable that this nation's current actions bear ample testimony to at least an unwritten policy of rehabilitating the shattered portions of the globe and of contributing a large portion of our energies toward a durable and honorable peace. The Marshall Plan and our intense participation in the United Nations Organization attest to our desire to stabilize the world. This nation no longer withdraws from

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

world politics whenever the course of events does not measure up to the hoped-for results.

Much in the same manner as deliberate and forthright actions have preceded major foreign policy statements, we have acquired strategic air bases prior to any major documented policies on the subject. The war was the occasion for the air bases we now hold, and these were acquired for operational reasons. Many, however, we have been reluctant to relinquish. Bases in Iceland and Greenland are good examples. A Joint Chiefs of Staff report of 1948 called attention to the northern approaches to the U.S. as critical and suggested that we retain a firm grasp on these two vantage points overlooking our Arctic and Atlantic frontiers. The British have suggested the manning of bases. Viscount Addison, government leader in the House of Commons, stated that the Atlantic Pact might provide "in the near future,a joint working arrangement, particularly affecting air power which could be deployed and developed rapidly in defense of peace." His colleague, Sir Samuel Hoare, four-time British Secretary for Air, urged the organization of necessary bases without delay. It appears that regardless of formal intent we are holding present bases for their value to the peace.

The question may arise as to public support of a strategic air base plan. This nation has previously been divided on the subject of any overseas deployment of its military power in time of peace. Steadfast in the practice of military action only as a means of repelling a nation already on the march, this nation has clung to the belief that it should confine its military power within its national boundaries. That concept appears to be dying fast. Indeed it is questionable if it has ever been more than a sedative to even its stoutest proclaimers. Hanson Baldwin writes in his book "Price of Power:"

"...the basis of our whole past strategy has been to fight our wars overseas, and the basis of our diplomacy (as applied to strategy) sometimes has been, always should have been, and henceforth must be, to insure the United States positions (bases) in readiness overseas from which our military power could be applied to the enemy, and allies-in-being, so that we would not fight a war alone..."

If U.S. foreign policy is,however, to be aggressive for peace, it is constrained to utilize every means to accomplish the task. It follows that strategic air bases, acquired in pursuance of that mandate, need be regarded not solely as launching sites for U.S. Air Power if a shooting war commences but also as active, forthright weapons for peace. In a discussion of the problem of bases as it pertains to Britain, RAF Group Captain J. G. Davis defined a solution: "Our own aim should be, therefore, to deploy our air forces as to prevent war by the threat of action, rather than to follow our traditional tardy policy of replying to blows already struck." The threat of action by strategically deployed U.S. Air Power is a potentially great force for peace. Its value to our foreign policy cannot be ignored.

More tangible recognition of the

1792

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

value of relating the mission of Air Power to diplomatic ends might be expressed in numerous ways. Adequate liaison between the Air Force and the Department of State will be increasingly necessary. Expanded instruction in foreign policy in the Air Force service schools would aid immeasurably in identifying and clarifying the possible bearing of Air Power upon international affairs. We can envision standard tours of duty with the State Department for selected Air Force officers. This proposition may violate military traditions of aloofness from political affairs, but it is to be noted that our government has recently entrusted officers of the Department of Defense with diplomatic positions of grave responsibility and sensitivity. The trend has been established by the pressure of international events, and the Air Force, as the prime mover of national peace power, cannot ignore its responsibilities to statesmanship.

Concentration of the Air Force within domestic borders would ignore the effects which more widespread deployment can produce in the political thinking of aggressor nations or nations which may waver between powerful sovereignties. We are not assured of a favorable geopolitical situation as far as our domestic air space is concerned. It is necessary, therefore, not only to exploit our present technological superiority in preparation for war, but also to improve our geopolitical situation for peace. If U.S. Air Power is deployed advantageously to conform to the geographical dictates of the globe and in direct and recognized support of our foreign policy, it can be said that we have correctly applied geopolitics to the air age. The Pax Britannica, which resulted from an application of this principle to an earlier age, will be succeeded by a stable world free from the constant treat of war.

Finally the continuous interplay of foreign policy and strategically deployed Air Power must not be deprecated by the trustees of either element. Neither the makers of foreign policy nor Air Force planners can afford to proceed unilaterally toward desired ends. Group Captain Davis, in his treatment of the problem as it affects the British Empire, notes that "the defense of the British Empire and Commonwealth is, as it always has been, as much a political and diplomatic matter as a military." The truth of this assertion applied to the United States must not be denied. The Air Force must regard diplomacy as a partner of defense and a strategic ally in the peace offensive. Our Government, conversely,must utilize the mobility and the capabilities of deployment of the Air Force for attainment of its stated international objectives.

Walter Lippman has called U.S. foreign policy the "Shield of the Republic." A shield is a parrying weapon; in this sense our foreign policy may be thought of as an international safeguard by means of diplomatic maneuver. A shield i s generally supplemented by a thrusting weapon, and in this respect our national power--land, sea, air, and industrial--must be integrated as that thrusting weapon for use in the diplomatic arena. U.S. Air Power, strategically deployed, can spearhead our composite of national power. It can ensure that U. S. foreign policy is recognized and respected throughout the world. In this manner the Air Force can logically substantiate its claim that "Air Power Is Peace Power."

Two New Stars,

IN THE JET SKIES

FLIGHT TEST. Here the Comet soars over Hertfordshire, England, in one of its test flights.

The world's first passenger liner basically designed for jet power, the British de Havilland "Comet" became airborne on 29 July 1949, to be followed less than a month later by the maiden flight of Canada's jet-propelled transport, the C-102 "Jetliner."

THE "COMET"

Four de Havilland Ghost III engines provide power for the Comet. These engines each produce 5,000 pounds static thrust for take-off, at 10,250 rpm. This long-range, high-speed aircraft is a 36-seater, with a payload capacity of 11,000 pounds. Cruising speed is estimated to be about 435 knots at 40,000 feet. The Comet's wing span is 115 feet, its length 93 feet. The wing is swept back at an angle of 20° on the quarter chord line.

The prototype Comet has split flaps fitted over the inboard section of the wing and plain flaps at the outboard portion. For deceleration, air brakes are also incorporated into the wing; this device also provides a method of altitude regulation during stacking and holding operations.

The Comet's engines are located between the main spars in the wing root. At the point of the undersurface of the wing where the engines protrude, hinged panels are fitted which open to give mechanics full access to the power plant. Panels are also fitted on the top side of the wing for further servicing. Steel fireproof bulkheads separate the engines, and individual

THIS PAGE IS UNCLASSIFIED

FINAL ONCE OVER. Technicians and spectators crowd the ramp where the Comet waits for its first hop.

fire extinguishing systems are provided for each section.

Provisions for de-icing equipment have been made for the air-intake, leading edges of the wing, and the horizontal and vertical stabilizers. To provide insulation, the windshields are laminated. In addition, hot air for de-misting is supplied internally in the windshield.

The main struts of the prototype Comet's tricycle landing gear are fitted with a single wheel; the nose assembly has twin wheels. Two separate hydraulic power systems are used to retract and lower the landing gear with a hand pump provided for emergency lowering. The nose wheel can be steered from the cockpit by a handwheel located next to the pilot. Twin disc wheel brakes are hydraulically operated with a duplicated operating system.

A maximum differential pressure of 8.25 pounds per square inch in the cabin pressurization system gives a maximum cabin altitude of 8,000 feet when the aircraft is flying at 40,000 feet. Compressors of each of the four main engines provide fresh air for the cabin. This fresh air supply, before entering the fuselage, goes through coolers and,when necessary, through a refrigerator. Temperature control on the coolers is automatic. However, the refrigerator can be switched in and out manually. Cabin heat is supplied by air compressed in the main engines. Humidifiers are also provided for the cabin.

The de Havilland Company recently announced that the Canadian Pacific Airlines has ordered two Comets.

THE "JETLINER"

The C-102, or "Jetliner," is Canada's bid in the jet transport field. A.V. Roe, Canada, Limited--"AVRO"--is the manufacturer. The Jetliner, powered by four Rolls-Royce "Derwent 5" turbojets, is estimated to have a maximum cruising speed of 370 knots at 30,000 feet.

POLAR GUIDE

This is the tenth of a series of articles on Arctic Indoctrination

Chapter 18--Land Survival (continued)

FOOD

You can satisfy both your hunger and the basic requirements of a healthful diet over a prolonged period--but it takes planning, ingenuity and effort. Emergency rations from plane and kits, plus possible snacks from your pockets and flight bag, are immediate sources of survival food. It is possible, of course, that a rescue plane will find you in a few days and drop additional rations. However, you can't count on "manna from heaven," and you'll be wiser to assume that your supplies must last several weeks. Stretch them. Be scientific about it. Make a list of the food on hand,and plan your meals so that available rations will cover a two-week minimum. Then set a daily quota for each man. Every few days take inventory and adjust allowances according to the remaining stock. Be sure to place your food in caches to protect it from rain,ground moisture, and animals. Whenever it is possible to watch it, however, leave some of it out and shoot the animals that come to steal it. A small food investment of this sort may net you a much larger food supply in return.

No matter how large your supply of emergency rations, however, you will need to supplement your rations with food secured by hunting and fishing. Leave a man in camp at all times ready to signal when a plane comes over, while the rest of the group splits up and searches for food. One can be detailed as fisherman; others as hunters--to be in the field as much of the time as practicable. At first, travel only short distances from your camp. Later, as you learn to know your neighborhood, increase the distance and search out the potentialities around you. There might be a trapper's trail half a mile away. When you go on a hunting trip, be careful to blaze a trail back to camp; in open country, set up piles of rocks or wands. If you are caught in a sudden blizzard and become confused, hole up in the snow and wait out the storm. Trying to continue may result in your being permanently lost.

HUNTING

Since your food supply depends to a great extent on your prowess as a hunter, it is well to develop your ability to hunt and your knowledge of animal habits before you are forced to depend upon that knowledge and ability to provide you with food. Therefore, whenever you get the opportunity,study first-hand the characteristics and traits of Arctic animals. You will find hunting, fishing, camping, skiing, and snowshoeing about your base one of the best ways of getting back to nature and finding out what it is doing in the polar regions these days.

You will discover that, with a few exceptions, three types of hunting are available to you, whether you are ten miles from your base or on the coastline north of the Arctic Circle. These three types are big game, small game, and flying game hunting. Learn the traits and feeding habits, the tracks, and the den

1797

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

or nest-making characteristics of the animals in your locale. You may need this information.

BIG GAME

Most carnivorous big animals are much better hunters than the average man. In fact, hunting, killing, and eating other animals is their main occupation. Nature has provided them with senses and equipment to do a good job of hunting, and since they devote their lives to it, you will find this type of animal shrewd and difficult to take with the firearms normally provided in survival kits. In fact, it's not at all strange for a man, while hunting, to come across bear tracks, which,if followed, will circle about and join his own tracks. The reason for this is simple. The bear is also hunting, and the man with the rifle becomes the hunted as well as the hunter. However, there's one thing in your favor--that the bear will track and study the actions of this strange prey for quite a while before becoming aggressive. Like all hunting animals, he follows the rule of knowing his prey and attacking at the most opportune time.

Take a tip from these animals, especially when hunting big game. Try to place yourself in the best position in relation to the game before shooting. Approach animals quietly and upwind if you expect to get close enough to use your .22-caliber rifle. Stay behind all the cover you can find and approach as close as possible to your dinner-to-be before leveling off at a vital zone and squeezing the trigger. Take your time. That animal may have been feeding right where he is for the last hour or so. In fact, he may never have been more than ten miles away from the spot on which he is standing. Just don't scare him, and you will usually have ample time to approach, take a steady aim, and squeeze off a single shot which will do the trick.

This method of big game hunting requires patience and lots of it. The foremost urge on the part of a man who is hunting for food is to shoot at the first big animal he sees, whether it's running, walking, out of range, or almost concealed by heavy brush. The odds are great against killing with a .22 rifle under these conditions. These shots will not only waste precious ammunition, but will also alert all animals in the vicinity.

You can kill big game with the .22 caliber survival rifle, but you must get well within range and place your shot in a vital spot. Pumping four or five wild shots into the body of an animal is not the way to do it. One shot which severs the spinal column, cuts an artery of the heart, or penetrates the brain is the best. With a powerful, high-velocity, big-game rifle it is possible to hit big game in a great variety of places which will prove crippling enough to allow you to approach for a second killing shot. But the .22 rifle will not break hip joints or shoulder blades, nor will it usually fracture skulls or disembowel the animal. Your first shot must kill; if it doesn't,it will probably be the last shot you'll get at that animal.

In big game hunting it is wise to consider defensive as well as offensive tactics. In the event a wounded animal charges and your only weapon is the .22-caliber rifle .410-gauge shotgun combination, try to get in a good shot with the .22 caliber barrel first. If this fails, wait until the last possible moment before firing the .410 barrel. This shotgun blast, if fired in the face

1798

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

of an animal at point blank range, will stop or blind him. You can have confidence in its doing this at eight to ten feet; but if you fire it while the animal is twenty to thirty feet away,the shotgun pellets will merely penetrate his skin and further infuriate him. Above all, in this type of action you must discipline yourself to wait until you know what your shot will accomplish instead of firing your shot to find out.

SMALL GAME

Since the .22 rifle can be used to cripple as well as kill small game, the target area when shooting small game covers a large percentage of the body. A bullet which breaks the shoulder blades of a fox is almost as effective as one which kills the animal instantly. A rabbit hit in the hind quarter with the charge of a .410 shotgun is not going to go very far. For these reasons you can take more liberties in shooting small game than big game. You don't have to come as close to your small game. Using the .410 shotgun barrel of your survival piece, you can get a good percentage of running small game.

Since most small animals build themselves shelters (or use natural shelters) and tend to stay in a locality for a considerable length of time, you can survey the entire area around you when snow is on the ground and determine from the tracks in the snow where most of the small game is to be found. Using these tracks, you can find the animals' dens or discover their paths to water holes, and you can sit in a sheltered spot and get good shots at the animals as they enter or leave their dens or as they run along the beaten path to the water hole. You can also capitalize on the old adage that curiosity killed the cat by sitting quietly around your fire area in the darkness watching for the eyes of small animals to appear. Another trick you can use is to place a decoy or bait in view of your shelter and sit there until the animals approach. You can use the entrails of the last animal you got as bait, or the skin of the last animal, stuffed with snow, as a decoy.

FLYING GAME

While here in the States it is not considered sportsmanlike to shoot quail or pheasant on the ground, make a practice, under survival conditions, of approaching birds on the ground or of attracting birds to the ground in your vicinity instead of trying to shoot them in the air. If you spot birds on the ground but out of range, carefully keep some cover between yourself and the birds until you are within range. And if you have good cover and kill a bird with your first shot,stay under cover for a while to see whether the other birds will come back and land in the same area. Frequently, they will take off and circle, then come in and land right where they were when you first saw them. However, if you run out in the open to retrieve the first bird you shot, it's very likely that the rest will not return to that area.

As in small animal hunting, it's often easier to attract the birds to the hunter than to tramp over four or five miles of snow looking for birds. You can determine what kind of food the birds are eating from watching the birds in your area or from the gullet of a bird you have killed. Try to get some of this food, scatter it out on the ground or snow in front of you, and establish yourself in a sheltered position to await the birds.

PROGRESS REPORT ON GERMANY

Adapted from a speech by John J. McCloy,
U.S. High Commissioner for Germany

JOHN J. McCLOY. The U.S. High Commissioner of Germany arrives in Berlin to assume his duties.

The people of the United States have a heavy stake in our policy in Germany, where, over the past 10 years, they have expended an enormous amount of human and material treasure. For that reason, it is important that they should be constantly and fully informed of the state of their investment in Germany and of the progress of their policy.

CURRENT DEVELOPMENTS

In analyzing what is going on in Germany we must remember that current developments are only superficially the result of what has been happening in the last 6 months. They are the outgrowth of what has and has not been done in Germany since 1945. More importantly, they result from causes and conditions that are deep-rooted in the German character and in German and European history.

With this in mind, consider for a moment what we have undertaken to accomplish since 1945 in Germany. It is not only to undo the 12-year rule of Hitler, a rule which probably represented the most profound indoctrination effort ever inflicted on a country. We have been, and we are trying to encourage the Germans to do some things perhaps even more difficult--the removal, for example, of those instincts of the German people and their leaders toward authoritarianism and aggression which mark a much longer period of German history than Hitler's twelve years.

FORCES AND ATTITUDES AT WORK

Now, what are the good and bad in the German picture--how much progress have we made toward our goal? Let us start with the darker side of the picture:

NATIONALISM

1. There is nationalism in Ger-

1800

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

NUREMBERG. The Palace of Justice (left) was the scene of many war trials At right, German civilians listen intently during the Democratic denazification trials.

many. There is a nationalist fringe on the extreme right which is more active than it has been. There is a Communist fringe that plays the Soviet game, and there is the persistent tendency of both these fringes to work together.

DENAZIFICATION

2. There are persons in important, though not top, governmental jobs who held similar positions under the Nazi regime. A number of undesirable persons have found their way back into leading positions in the business life of the country. This does not include thousands of former Nazis who were school teachers, mail carriers, tax officials, etc., under the Weimar Republic who became party members under Hitler and are now back at the old stand. These people have gone through a denazification process which may well leave much to be desired--and they have been reinstated after paying their penalties or after having been acquitted. The denazification process predated my assumption of office in Germany, and I do not feel called upon to defend it. But I do feel that our denazification program was by far the most sweeping attempt made in Germany to deal with this difficult problem. I believe the time has come to permit these so-called little Nazis to demonstrate their loyalty to the new Germany and judge them on that basis rather than on their past weaknesses and misdeeds. They cannot and should not be excluded forever from normal life in the community. Obviously this does not refer to major Nazi offenders who are still paying and should continue to pay for their unspeakable crimes.

TRADITIONALISM

3. Traditionalism still largely influences German thinking. There is a considerable resistance to reform, ranging from passive opposition in some cases to outright obstruction. There is, for example, in many quarters reluctance to adopt civil service reforms and resistance to major school reforms.

INERTIA

4. A majority of Germans are gripped by political and social inertia. Many Germans continue to divorce themselves from the interest and responsibility necessary to the functioning of democratic government. There is an exasperating willingness to leave responsibility and direction to others. German political leaders are prone to take advantage of this apathy.

POSITIVE FORCES

Such are the various nationalist

1801

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

and traditionalist forces and attitudes in Germany. I have deliberately placed the negative forces first in my account. I firmly believe, however, that positive forces are at work which are stronger than the negative. Here are my reasons:

FREE-ELECTED GOVERNMENT

1. In Western Germany, there is today a free-elected Government and parliament. This government is new; it has much to learn--how could it be otherwise after the Hitler years? But, whether its trend is a little left of center or a little right of center, it is headed in a democratic direction.

REPRESENTATION

2. This German parliament is made up,in large part, of representatives who resisted Hitler, men who were in concentration camps, men associated with the Weimar Republic which Hitler liquidated, labor representatives,and other liberal-minded citizens.

PRO-DEMOCRATIC LEADERS

3. In the Laender, which correspond roughly to our states, the officials for the most part,were originally selected by American Military Government for positions of authority because of their anti-Nazi and pro-democratic records. These leaders have since been confirmed in free elections by the German people.

VIGOR OF PRESS

4. Another cause for considerable satisfaction is the growing vigor of the German press. Though there are weaknesses in it, the press which we helped start after Hitler's collapse has demonstrated an instinct to catch political abuses, to expose them, and to help develop public opinion. It has demonstrated a growing sense of public responsibility.

LIBERAL LEGISLATION

5. The Laender Parliaments have passed an impressive total of liberal and progressive pieces of legislation that show a strong and voluntary tendency to draw away from Hitlerian concepts.

There are other factors. Despite their apathy, the German people prefer representative government as opposed to dictatorship of either the Nazi or Communist type. A vast majority of Germans are deeply opposed to militarism and war. The German people want no more military adventures.Moreover, in economic matters, the Germans indicate that they prefer a liberalized economy over a planned system.

The Germans in general are receptive to plans for consolidating Europe, and they are willing to give up elements of real sovereignty to achieve this end. Today, the idea of Western European consolidation represents to the average German, and particularly to the youth, the best hope for the future.

GERMAN YOUTH ADMINISTRATION. This program, set up by the Americans, is playing an important role in teaching young people the Democratic way of life.

THIS PAGE IS UNCLASSIFIED

There are in Germany many individuals and many small groups of people who are working faithfully and intelligently to break authoritarian habits. They include editors and teachers, politicians and trade union leaders, students and youth leaders. They have the idealism and energy, the goal and the hope.

INFLAMMATORY ELEMENTS

Let me now strike a balance. There are evil and nationalist embers in Germany, and embers are always dangerous. They are particularly dangerous when inflammatory material is nearby. Such material exists, if nowhere else, in the vast number of German refugees from the East, in the unemployed, and in the homeless youth. There have been nationalist incidents, and there will be new incidents and situations that will be both deplorable and alarming. But no one could contend, as the Socialist Mayor Reuter put it to me the other day in Berlin, that all the evils of Hitler's 12-year rule can be removed in 5.

In other words, there is danger, but if there were no danger in Germany we would not be there. Germany constitutes danger within itself and even more fearful danger if allied with, or subordinated to, the interests of the Soviet Union. And, as I have said, the Communists and Rightist extremists in Germany seem prepared to get together with the totalitarianism of the Soviet, should a good opportunity present itself.

GERMAN AGGRESSIVENESS

In this connection let me state the following:

There has been talk that we have given up power too soon and that we do not have the means to cope with a serious revival of German aggressive attitudes. I understand this apprehension. Naturally, we are not without information about extremists

FRITZ REUTER. The Lord Mayor of Berlin, recognized by the U.S. Forces, addresses a demonstration in the German Capital.

trends. Furthermore, we have ample powers to deal with any dangerous nationalist revival. Our powers are both positive and negative; positive in the specific authority to intervene if a serious threat to our objectives develops; and negative in our right to deny concessions from the existing status if liberal tendencies do not develop. If necessary, I would not hesitate to apply these remedies, swiftly and firmly.

But I contend that some of the alarming incidents you may read about are not representative of present German conditions or of German attitudes as a whole. Every day, there are many unreported evidences of courage, of determination, of the will to prevail over the past. In them, there is great potential for good, and I feel that these elements and forces will prevail, if they continue to have our encouragement and support.

CHIEF OBJECTIVES OF OUR GERMAN POLICY

In conclusion, here is what I view as the things of chief importance in connection with our German policy:

It is our Government's policy to seek a unification of all occupation zones of Germany on a democratic and federal basis, and we shall assist all efforts of the Federal Republic of Germany toward that end. We will, likewise, do everything in our power to prevent a unification of Germany under Soviet or Communist domination.

We must continue to be alert and uncompromising on true security issues.

We must continue to insist on the equitable treatment of Hitler's victims and their heirs.

We must help the Germans solve as rapidly as possible the critical social and economic problems of Germany--serious problems which the rise in production figures tends to conceal. We must encourage the establishment of a free economy. At the same time, we must take measures to prohibit Germany from joining any international cartel.

We should maintain, as far as lies within our power, a unified policy with respect to Germany among the three occupying powers of the West--Britain, France, and the United States.

We should bend every effort to encourage Germany to take, if need be, the first steps to bring about a true partnership of Western Europe and induce the other Western European powers to accept this principle for themselves and for Germany. I feel convinced that this concept of Western European unity and partnership is the desire and will of the common people of Europe, and it should not be denied them.

We should continue to press and encourage the German governments and people to adopt liberal, progressive measures throughout Germany, whether or not these measures are within our powers to dictate.

We must encourage and stimulate every effort to give the youth of Germany justified hope in the future. Here, I think, is our greatest challenge and hope. We Americans are peculiarly fitted to help the Germans toward the goal of democratization. It is my intention and that of my staff in Germany to reinvigorate our whole program in this field. We shall use all our power and resources--and they are large--to help the schools and universities, the trade unions and churches, the press and radio; in other words, all those institutions which are the bulwarks of freedom. Here, we Americans in Germany are taking, as we should, the lead. And in the year ahead, it is my hope that we shall make real progress in this field.

I know there will be setbacks, and you must be prepared for them. But I have tried to give you the reasons why I have hope that the Germany of tomorrow will not be the Germany of yesterday.

We face a hard task in Germany. But if we remain firm and united against any backsliding, if we continue at the same time to encourage the best Germans, we have good reason for hope. Within Germany itself, I firmly believe, there exist spiritual resources from which can emerge a peaceful, democratic state, prepared to take its place as a true member of the Western world.

COVER PHOTOS

The Navy's first turboprop patrol plane, the XP5Y-1, designed and built by Consolidated Vultee, has completed her successful maiden taxi run. It is expected to take to the air after additional taxi tests.

The XP5Y-1's Allison T-40 engines, swinging contra-rotating propellers, develop a total of 22,000 shaft horsepower. A speed of 345 knots is expected.

The rakishly designed plane features a high length-beam ratio hull which reduces flight drag while improving water landing characteristics. The sleek lines result from extensive hydrodynamic research.

Radar equipment is carried in the plastic nose section while the bulge at the tip of the vertical fin houses the antenna. Located on either side of the bow are the radar-operated remote turret installations.

The plane carries powerful armament including cannon, rocket projectiles, and medium-range guided missiles. The craft will actually be a Navy cruiser with wings.

Turbine-propeller planes have never been flight-tested in the U.S. to any appreciable extent and it is expected that flights of this new plane will provide considerable engineering data. Aircraft engineers expect that these turbine propeller engines will provide the transitional step from piston engines to long-range pure jets.

WORDS OF WISDOM

"The Second World War proved that modern wars are fought on the industrial production lines as much as they are in the theaters of combat action. Even the largest aviation research and development program is of little value to national security unless it is supported by an aircraft industry capable of meeting the tremendous demands for air weapons that active hostilities rapidly impose. The attack on Pearl Harbor in 1941 thrust the United States into conflict with powerful nations equipped to wage total war at a time when there existed only the skeleton of an American defense industry. We were able to achieve victory under these circumstances only because of the time and distance that separated us from our enemies."

—General Spaatz

AIR INTELLIGENCE **Review**

This "Review" is published for three reasons:
1. To provide timely data regarding new techniques, practices and general information whereby intelligence personnel can maintain proficiency.
2. To provide material which will afford all personnel an appreciation of the intelligence role.
3. To provide a medium whereby all intelligence personnel and activities may exchange viewpoints, problems and solutions.

Two types of material are solicited for publication:
1. Stories and pictures relating to the intelligence activities being conducted within an organization.
2. Original articles of a noncontroversial but informative nature.

Material submitted must include sources utilized and the authors name, rank and present military affiliation. Mail stories to: The Editor, "Air Intelligence Review," ConAC, Mitchel Air Force Base, New York.

EO 11652

INDIA AND PAKISTAN. Trouble over Kashmir keeps these two countries on the verge of open hostilities.

There is trouble brewing in the Asian countries surrounding Communist China. To realize what is happening among the 700 million people who live east of Afghanistan and outside China, it is necessary to examine surveys made by Americans in a dozen countries, thousands of miles apart.

In Indo-China, Burma, Korea, and Malaya, it is clear that combat is taking place, even though one does not see the actual fighting. Jeep loads of soldiers escort officials. Road blocks, barbed wire barricades, and other accoutrements of war are apparent.

Elsewhere in the area military action, or the prospect of it, is holding up economic recovery. Countries such as Pakistan, India, and Indonesia are spending sizable sums on arms and soldiers. Between Pakistan and India the atmosphere is really tense. India has a tremendous population, hungry for food and lacking sufficient farmland. Pakistan has a half million tons of food spoiling in warehouses because of its trade war with India. Incidents between Moslems and Hindus in East Bengal are magnified into crises. Should actual hostilities break out between India and Pakistan, a major conflagration would develop with Afghanistan and Communist China probably joining the fray.

There are, however, some bright spots in the picture. Some countries (chiefly Korea, Indo-China, Thailand, Pakistan, and the Philippines) have food surpluses. Others have commodities for export as the minerals, jute, and cotton in Malaya, Indonesia, and Pakistan.

In the terms of the progress of democracy, there are fresh and encouraging signs in Japan. Democratic leaders in many new governments show good will, good intentions, and enthusiasm. The British have set up good local governments in Malaya, especially at Singapore; and, despite

some remnants of Colonialism, the British rule in Hong Kong is helpful to the democratic cause. India and Pakistan each have a good supply of trained personnel while Thailand has developed capable people of its own.

Even in Indo-China things are a bit brighter than they have been painted. Bao Dai, the Annamite Emperor brought back by the French, really drove a hard bargain with them. Bao himself is a surprise to many Americans whom he had originally impressed as a playboy. Actually, he is a competent man intelligently conversant with his country's economic and political problems. He is an ardent Annamite nationalist determined to make his country an independent unit within the French Union, like a country within the British Commonwealth. Further, he has gathered around him good men who are gaining much support from people who were formerly fence straddlers.

On the minus side, however, one cannot escape the fact that the governments in many of these countries are pretty weak. Some of them are not living up to the idea of democracy. Others simply lack the trained personnel to do a good job. The world can't expect to see real democracy in many of these countries for a long time.

Many of these countries have traditional tendencies toward dictatorship that break out when the leaders come up against revolts and run into trouble with their neighbors. The Indian Government, for example, uses pretty high-handed methods to subdue its local Communists.

In many places, what one finds are native officials, with little or no training, up against situations that would baffle even trained personnel. Korea faces the threat of inflation, with the Communists of Northern Korea putting constant pressure on the Southern half of the country. Pakistan is in serious economic and financial difficulties.

The introduction of native personnel into business management is difficult. American oilmen in Indonesia, for example, want to put Indonesians into management, but it's hard to find trained or able men. This is true in Burma as well.

Band-wagon psychology is going to have a lot to do with the way things go in Asia. Many Asians are not swayed so much by ideologies as by their idea of which side in a given conflict is going to win. Communists everywhere are trying to give the impression that their ship is riding an irresistible wave of the future. They are warning the Asians to get aboard before it's too late.

The Siamese are an example. They are confident that they can preserve their country by their wits. You get the impression that the Siamese are more like the willow than the oak. They bend with the prevailing winds. They bent to the Japanese and then to us. Thailand probably wouldn't stand long if Indo-China and Burma went to the Communists. Americans, however, are popular in Thailand, and most Siamese appear to be betting on the U.S. side. The country is rich and produces more than a million tons of rice for export. It has land laws similar to the old homestead laws of the U.S. Midwest and there is no tenant-landowner problem. But despite this, Thailand can't be considered much of a bulwark against Communism.

Chinese communities in many of the countries of Southeast Asia are a real source of danger for democracy.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

There are about three million Chinese in Thailand, two million in Indonesia, and there are large Chinese communities in Malaya, Burma, the Philippines, and other countries. These Chinese centers are fertile ground for the Chinese Communists. The Communists use the Nazi technique of reprisals against families living in China and pressure through business contacts. Such methods are paying off for Moscow and for Peiping.

Many of these Chinese are wealthy and influential. They are businessmen, bankers, newspaper publishers, and the like. In Thailand, the majority of the dock workers are Chinese and could tie up most of the shipping in the ports. Even the wealthy Chinese feel pretty hopeless about Communism; they are inclined to look to China no matter who is running things there. Some of the biggest Chinese-owned newspapers have switched to the Communists. Wealthy Chinese are buying Chinese Communist "victory bonds," too. In Singapore, the British officials announced that it was contrary to exchange regulations to buy such bonds, and the rich Chinese were delighted to have an excuse not to buy. But such communities are fertile ground for Chinese Communists.

There is a lot of bad feeling between natives and the Chinese communities, some of it traditional, some new. In Malaya, where Chinese guerrillas led by Communists are active, this antagonism is very strong. In Thailand, the Chinese are about the only Communists in the country. Hostility toward the Chinese is deep rooted in Indonesia. Even in the Philippines there are Chinese Communists helping the Huk rebels, although the Huks were active before the Communists came into the picture.

The attitude toward China--Communist China--in most of the neighboring countries is one of fear. Traditional fears are fanned by the Chinese Communists. Peiping radio, for example is telling Indo-Chinese that their country was once a part of the Chinese Empire and that the French are treating Chinese badly. Naturally there is a real fight between the French and Ho Chi Minh's Communist-led forces for the border between Indo-China and Communist China.

The Burmese are worried about actual invasion. There is a disputed area along the Burmese border where the Chinese Communists might move in. The Burmese also are worried about the Peiping announcement that Tibet will be invaded if the Tibetans don't knuckle under to the Chinese Communists. Long ago, Burma used to send gifts to the Chinese Emperor. The British, when they came in, thought this was a form of tribute and continued the gifts as such, placing Burma, like Tibet, in the position of a Chinese dependency. So, when Peiping talks about "liberating" Tibet, Burma fears it may be next.

Most Southeast Asians, when they think of Communism these days, think of Communist China, not Russia. The attitude toward the West and the U.S. in particular is fairly good in most places. Everywhere, however, people are perplexed because Britain has recognized Communist China while the U.S. has not. They think this indicates some sort of split between the U.S. and Britain.

There is, of course, in many places a hang-over from the colonial period when native nationalists concentrated on European powers as the "Enemy

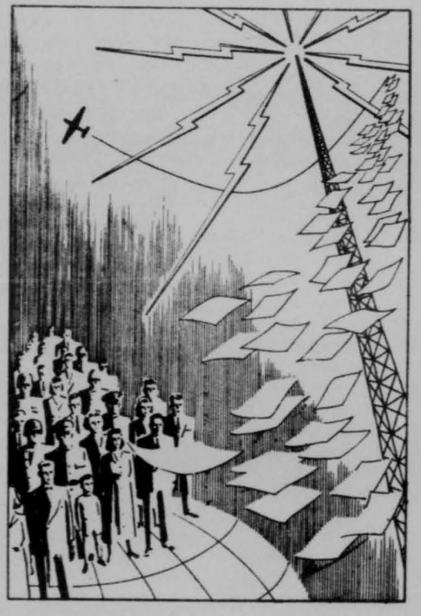
PROPAGANDA:
A CONSCIOUS WEAPON OF DIPLOMACY

Adapted from an article by George V. Allen,
Assistant Secretary for Public Affairs

The American public is largely unaware of an important change which has been taking place during the past 15 years in the conduct of foreign relations. Every major foreign office in the world, including our Department of State, is doing things today which they would have considered startling, if not improper, even 10 years ago.

Until recent years, international relations between peoples were conducted by relatively few officials especially selected to live abroad for the purpose of representing one government to another. These officials were forced by custom and precedent to deal only with an equally limited group of diplomats in the foreign office of the receiving country. Although diplomats were permitted to establish social contacts with the people among whom they lived, they were not expected to deal on political matters with anyone except the foreign office. Although I do not suggest that this restriction, built up through generations of experience, has been totally discarded today, some rather surprising new methods in conducting foreign relations are being developed and one wonders where the trend will lead.



CHANGE FROM TRADITIONAL DIPLOMACY

In January of 1949, relations between the United States and the Soviet Union were in a very poor state. The Western zones of Berlin were under strict blockade, and the United States Air Force, aided by the Royal Air Force, had to fly through the storms of winter to deliver supplies for two million people. At the same time, counter-blockade measures which had been imposed against the Soviet zone of Germany were hurting the Soviets, and on Germany and the rest of Europe the propaganda effect of the generally unexpected strength and success of the airlift was beginning to run steadily against the USSR.

THIS PAGE IS UNCLASSIFIED

Stalin wanted to get off the hook. He had imposed the blockade in the confident expectation that we would be forced out of Berlin. When he did not succeed by January 1949, he was ready to talk. Under traditional diplomacy, he should have telegraphed his Ambassador in Washington to approach the Department of State, or he might have called to the Kremlin our Ambassador in Moscow, Gen. Bedell Smith, and informed him in the greatest secrecy that he believed the difficulties over Berlin could be solved. Ambassador Smith would have hurried to the American Embassy and drafted an urgent telegram which would have been sent off to Washington in top secret code. The next morning the Secretary of State would have taken it to the White House and laid it before the President.

Neither of the foregoing methods was followed. Instead, Stalin sent a cable to an American newspaper correspondent in Paris, answering certain questions the correspondent had addressed to him and which he found it convenient to answer. Stalin's answers added up to a pretty good indication that his government was ready to begin discussions.

The next morning Stalin's message was in the Department and on President Truman's desk at the White House, but not in the form of a secret diplomatic cable. It was in an eight-column streamer on the front page of every American newspaper and was being proclaimed simultaneously by every radio station and newspaper throughout the world. Secretary Acheson and President Truman got the message all right—at the same moment as everyone else who could read or listen among the two billion inhabitants of the globe.

The method Stalin used in conducting his foreign relations in this instance was by no means unprecedented. Woodrow Wilson proposed peace Terms to the German people in 1918 through a speech to Congress, containing the famous 14 points or conditions under which we would end the First World War. He could have proposed to the German Government through Swiss or other neutral diplomatic sources. The Duke of Wellington doubtless addressed messages to Napolean through the press of his day, and Cyrus the Great probably started bazaar rumors for his purposes.

PROPAGANDA METHODS

But, for better or worse, propaganda as a conscious weapon of diplomacy has increased tremendously during recent years. The technical development of mass communications, by which the greater part of mankind can be reached almost simultaneously by press or radio, and the increased numbers of people who can read or understand may prove to have made this new tool as important to diplomacy as the invention of gunpowder was to military science.

We are not particularly concerned here with whether either gunpowder or propaganda have benefited or harmed mankind. It is just this point which is emphasized: that propaganda on an immense scale is here to stay. We Americans must become informed and adept in its use, defensively and offensively, or we may find ourselves as archaic as the belted knight who refused to take gunpowder seriously 500 years ago.

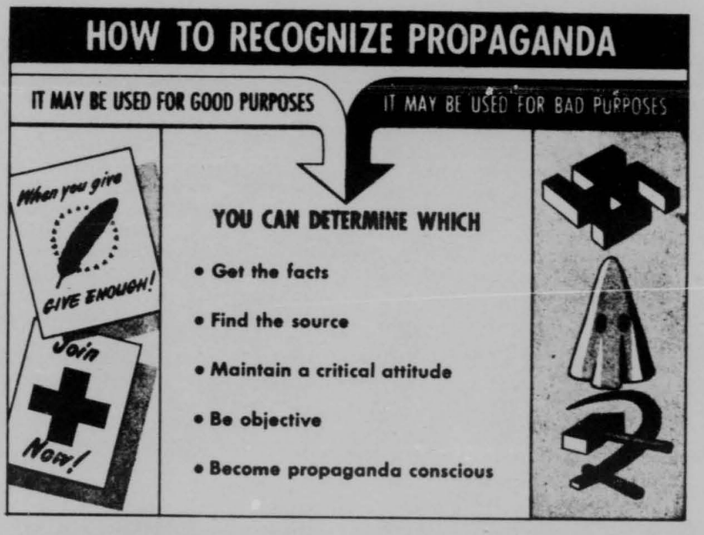
Let us consider another example of the use of propaganda in modern diplomacy. Last year, a highly significant election took place in Italy. The issue was whether communism would continue its march into Western Europe or whether democratic forces could turn the tide. Radio Moscow and all the agents of communism outside and within Italy went to work with presses and loud speak-

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED



ers to convince the Italian voters that communism offered the panacea for all their woes. The United States and other democracies did not stand idle.

By press, motion picture, and radio we tried our level best, through open propaganda methods to persuade the Italian voter that democracy, although offering no immediate paradise, was a surer method of progress. The Voice of America transmitted short-wave programs in the Italian language every day, beamed toward the people of Italy, extoling the advantages of democracy. Americans of Italian origin were encouraged to write to their relatives in Italy, counseling them to vote democratic. We arranged for American newsreels, showing the American way of life and American aid to Italy, to be shown in every Italian theater for several weeks prior to election day.

At present, the State Department sends out programs over the Voice of America in 22 languages every day, beamed to almost every corner of the world. It is true that we still write diplomatic notes to foreign governments, but we also try our utmost to reach directly into as many foreign homes as we can all over the globe. We talk directly to foreign peoples as well as to their governments. And every other major power is doing the same thing.

Our information, or propaganda, activity is by no means directed solely at peoples behind the Iron Curtain. The Department now maintains 85 information libraries in the leading capitals and important cities throughout the world. These libraries that contain American books and periodicals are usually not located in our Embassies but in separate buildings on busy streets where they will attract the largest numbers of individual foreigners.

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

In Mexico City, for example, our famous Benjamin Franklin Library is a conspicuous building on one of the principal thoroughfares. We encourage every Mexican passerby to come in off the street and read what we have to offer. And mind you, the Mexican Government does not ask us to clear with it what we show the Mexican citizen. We are trying hard to reach Mexicans, Englishmen, Iranians, and Hottentots directly, without having to channel our activities through their governments. We are succeeding in this effort to deal more and more directly with the actual public of other nations.

The Mexican Foreign Minister assured me recently that the United States Information Library in Mexico was the finest activity the United States could possibly carry on in his country. This indicates we are not cramming our propaganda down their throats.

We also show American documentary films abroad and sometimes take projectors into the mountain valleys of Central America, Afghanistan, and Ceylon to show movies to anyone who wishes to attend our presentation. We demonstrate democracy in action through scenes of American life.

All this activity is a far cry from a few short years ago when diplomats dealt almost exclusively with foreign offices. Some observers of international affairs, and not alone the gentlemen of the old school, are still shocked by this new activity. Some think the government is in a field that should be left to private industry. Others feel that the direct approach constitutes interference by one country in the internal affairs of another and will come to no good.

POTENTIALS OF DEMOCRATIC APPROACH

After two years of experience in this new method of conducting foreign relations, I have reached a few general conclusions. I am convinced that unless the United States continues to utilize this new method, we shall be left at the post by other countries which are becoming skilled in the use of mass media. New methods in government, like new discoveries in science, can be used for good or ill. Direct radio contact with foreign individuals may be used advantageously to proclaim falsehood as well as truth. But the potentialities of the direct approach are very great in both directions, and we must understand and perfect the techniques to protect and advance our interests. Furthermore, I see no need for the United States to become concerned over a contest in the mass propagation of ideas. We have in democracy the best commodity to sell, and we are ahead of the world in physical facilities and know-how in mass communications. Our chief problem is to find the proper balance between government and private industry in the field.

The direct approach in diplomacy will probably prove, on balance, to be a good development. It is the very opposite to secret diplomacy. If propaganda is deceptive, the glare of world publicity will generally find it out. Lincoln's confidence in the people's wisdom is still apt. Moreover, public debate, openly and honestly conducted, is not interference.

The direct approach, where there is no censorship, is the democratic approach. The Department of State assists friendly foreign governments in presenting their case directly to the American people, and we do not even try to jam unfriendly programs off the air waves.

As Congressman Daniel J. Flood said recently, "If Congress made it

RESTRICTED

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

illegal for people in this country to listen to foreign broadcasts, 150 million Americans would oe listening to them tomorrow, and I'd be one of them." As long as information is free in this country,we need have no fear for our institutions. No dictator ever existed without censorship and no democracy with it. A police state is desperately afraid that its citizens may read and hear directly what foreign governments have to say. Hence the frantic jamming of the Voice of America by the Soviet Union.

I am convinced that eventually, world government of some sort will be accomplished, but it can be brought about onlythrough the assistance of the direct approach to peoples. Propaganda, when based on truth, can be an unequalled force for good.

As Dr. Reinhold Neibuhr points out, the peoples of the world must develop a much greater sense of world community before any form of international political structure strong enough to keep the peace can be developed. To develop a world community, peoples must establish more direct contacts with each other across international boundaries. UNESCO,the United Nations Educational Scientific and Cultural Organization, is making significant progress in this direction.

In the efforts now being made by governments to reach foreign peoples directly, we may be witnessing an important movement toward the establishment of a world community. At any rate, the American Government will do everything it can to hasten the time when peoples speak directly to peoples in a thousand tongues calling for peace.

No. 1." But that is fading fast. The Indonesians in power are getting along quite well with the Dutch, particularly the younger Dutch officials. Even Malayan nationalists don't want independence right away because they welcome British protection against a possible attack from China. Anti-Western sentiment in Indo-China, of course, focuses on the French.

On the whole, Southeast Asians in power are very interested in President Truman's Point Four program for U.S. technical assistance in the development of backward areas. They know it won't involve a great deal of money, but they all have a keen admiration for American know-how and want help on such things as irrigation, electrification and transport. India is pretty suspicious of foreign capital, but the trouble is that India's own businessmen are reluctant to risk capital investment in the things India needs most.

Southeast Asia doesn't appear to need military aid on a big scale. In most places it is largely a question of Guerrilla fighting in the jungles or in the mountains, small forces met by somewhat larger forces on the defensive. Propaganda warfare is important, of course. Russia's big Embassy in Bangkok is quite active along these lines, co-operating with Chinese Communists. Americans are active in the war of ideas all through the area.

The impression one receives from all these surveys is that a great deal can be done by applying small amounts of economic, military or technical aid in the right place at the right time.

RUSSIAN POLAR DEFENSES

This article is translated from Feuille D'Avis Neuchatel, a liberal Swiss newspaper, and deals with Soviet developments in the Arctic. It is published for its possible corroborative value.

"Will the great plains of northwestern Europe long remain the predestined battlefields where at regular intervals the most promising sons of the old and new worlds are called upon to shed their blood? This may be doubted since the discovery of the atomic bomb, which is forcing the specialists in war to think again. There are many things which go to show the importance attached by both Americans and Russians to the Arctic regions," writes the Institute of American Advanced Studies.

On the strength of these last data of the atomic war, the experts believe that bombs will be launched from one continent against another via the North Pole. It may be mentioned that the greater part of the world's riches are concentrated about 40° and 50° latitude, north, and when it is remembered that these parallels are some 5000 kilometers from the Pole, the interest evinced by the Great Powers in these regions where the most decisive attacks may be launched, will be understood. Thus more and more people in the United States are emphasizing the importance of the Arctic in the defense system of the American Continent.

The Russians have a decided advantage in this battle where the sextant and the compass are the weapons mainly employed. Russia has gone further than any other country in the exploration and exploitation of the Arctic regions. One has only to think of the results obtained by the Glavsevmorput (General Management of the Northern Maritime Route). There has been one meteorological and geological expedition after another during the last few years. The number of Soviet meteorological stations in these regions is estimated at about 300, while Canada has 10, and the USA fewer than that.

The author of a recent report on the naval and air power of the United States concludes with the words: "He who holds the Pole holds the world." The following is a statement by an eye witness, who, after having spent some time at Novaya Zemlia, managed to get back to his (western) country. (Novaya Zemlia is an archipelago at the extreme north of the Urals, whose shores are washed by the Bering and Kara Seas and by the Arctic Ocean.

"From April, 1946, when I left the hospital, Vorkutsk looked like a great military camp near the front line. In the town itself, which is still in the process of construction, 60% of the houses had been requisitioned for the high command and staffs of 16 divisions already concentrated in the region. These divisions were chiefly composed of soldiers from the southern parts of the USSR. The object of the maneuvers seemed to be to try out the methods of warfare in polar conditions at different seasons and to test the ability of the soldiers who came from districts where snow was almost unknown, to defend themselves and live in the Arctic climate. This problem was studied in a great, recently constructed laboratory and military clinic installed in the

THIS PAGE IS DECLASSIFIED IAW EO 13526

TOP OF THE WORLD. This map shows graphically the vast importance of polar defenses.

hospital of the shipping yards of Vorkutsk. The laboratory was under Professor Andre Prunnikov of the Soviet Army.

Special military equipment arrived with the men by the North Pechora Railway, and included armored vehicles equipped with both wheels and skis, heavy tanks (called "Ninotchka" by the soldiers) made so as to move in deep snow and on ice, and little, rapid tanks. This materiel, which appeared to be very abundant, was usually loaded at the "Coal Station of the First of May," which had more than a dozen cranes, and was then sent across the town to be parked in the suburb called Sed-Yol."

Since this report, other facts have come to light which confirm American anxieties. It is not easy to obtain information concerning the Arctic bases of the USSR, but we have excellent reason to believe that Tiksi, on the estuary of the Lena (400 miles from Nome and 500 miles from Resolute Bay) is the central point of the system of military bases running from Spitzbergen, Franz Josef Land and Dicksen Island to the west, to Wrangel Island, Petropavlovsk, and Vladivostok in the east. A few years ago Tiksi was only a little Eskimo village; today it is a modern city and an air and naval base of the first importance. It was born so recently and so secretly that very few maps show it. Tiksi, which now has a population of just over 100,000, is the heart or, at least, pivot number 1 of the So-

viet polar front; Lake Baikal is its supply center; and the Transsiberian Railway the artery which maintains its life. The provisions arrive at Lake Baikal by rail, from where they are sent to their various destinations by the Lena, usually on ice as this river is frozen over ten months in the year. The Russians have built themselves hundreds of airdromes along the Siberian coast and Tiksi can thus maintain contact with Archangel by sea. From Tiksi or one of its many bases Russian aircraft can get to Alaska in a few hours and, by pushing on, could destroy the industrial centers of Canada and the north of the United States.

The region of Lake Baikal is a supply center for other Siberian bases and in particular those of the Chukotsky Peninsula (40 miles from Alaska) from where engines of death of all descriptions can accomplish their murderous tasks in record time. Side by side with the construction of airdromes, that of launching sites for long distance weapons is proceeding rapidly so that the work undertaken with a view to an offensive operation against the United States will be completed by next spring.

Vladivostok, the terminus of the Transsiberian Railway, and the principal port of the USSR on the Pacific, is a supply center for the military bases of Kamchatka and is also an air and naval base of great importance. Most of the Soviet submarine fleet is concentrated there. It may be mentioned that the German experts who constructed the submarine shelters that the Allies were unable to destroy during the war are now working in Siberia.

On the Kamchatka Peninsula, the Soviets have constructed strategical roads leading toward the Okhotsk Sea, on the coasts of which are several military bases. At Petropavlovsk, the port of Avantcha has been dredged and the construction of airdromes and numerous shipping yards has just been completed.

Furthermore, there is reported to be great activity in the Kurile Islands in the matter of construction of air and submarine bases. The old Japanese plant has been altered and enlarged and reinforcements of workers are constantly arriving in the islands. The bases for the fighters and light bombers are on the island of Paramochiri, the dive bombers and sub-killers are on the island of Matzuva, while Etorofu Island has submarine bases and three airdromes.

In the opposite direction—toward Europe—the Soviets have constructed powerful air bases on Franz Josef Land, from where they can, via Greenland, reach the United States directly.

It is also reported that a strategical port has been in process of construction since 1946 at the estuary of the Dvina on the White Sea opposite the Kola Peninsula, the idea being to "double" Murmansk.

In the space of one year, docks have been constructed which can accommodate 30 large vessels and new shipyards have been developed in which warships have been laid down. Two years ago the city called Molotovsk had a population of only 40,000; now it has 100,000, and according to Soviet plans will be three times as large soon. During the last few years there have been military maneuvers on a large scale in the Arctic regions. Those of 1947, were directed by the "Soviet Byrd," Simon Grodichenko, and covered a distance of 2000 kilometers, terminating at Archangel. Far more troops were engaged in these maneuvers than in the equivalent Canadian and American ones. - ID No. 633802 Rest

WHAT RUSSIA'S BOMB MEANS TO US

By Major General Hugh J. Knerr, USAF (Retired)
Reprinted through the courtesy of Nation's Business and General Knerr.

We have accepted the Russian bomb impassively, but we cannot accept it indifferently. For no living free man can escape its burdens. The President will make onerous requests of the next Congress--higher taxes, greater sacrifice of industrial produce, faster arming of Europe, perhaps a new draft, additional inflationary risks--and to consider such measures we should know the realities of the Russian bomb.

REALITY NO. 1: The enigmatic Russian Government, unrestrained by Christian ethics, will very soon--if it strikes without warning--have the power to deal to the West what may be a disastrous blow. Our civilization commits us to the acceptance of any first thrust--to the waging of war only by recovery and counterattack--and no one can now safely predict how rapidly or, indeed, how surely we of the West can recover from an atomic Pearl Harbor.

REALITY NO. 2: If and when the Russians decide to strike, they will not strike at western Europe or the Middle Eastern oil fields; they will strike directly at the great port cities of the United States. Of this we may be certain from our knowledge of Russian preparations and from the nature of atomic warfare. The Russians will never risk a military adventure against a lesser nation which will justify our striking the first atomic blow: they won't make the German mistakes; they will strike directly at America.

REALITY NO. 3: If and when the Russians decide to strike America, their initial effort will not be through the air as is popularly supposed, but by sea. Russia has an immeasurable atomic advantage in the fact that we have six great port cities with enclosed harbors while she has none. All the important Russian cities are far in the interior and must be attacked by air, while we have a Panama Canal and six great cities--Boston, New York, Baltimore, Norfolk, Seattle and San Francisco--whose enclosed harbors make them the world's most perfect atomic targets and the simplest to attack.

Through the air is the difficult, expensive way to assault a nation with atomic weapons. You must accept losses in both airplanes and precious bombs. You cause immense destruction; but when the bomb is exploded in the air the radioactive cloud is not persistent. It dissipates rather quickly. The ideal way to deliver the bombs is by freighter or submarine, exploded underwater in an enclosed harbor. In this manner you risk loss of neither airplanes nor bombs; you husband a limited stockpile; and the radioactive mist, unlike the air cloud, is persistent--it hangs over the target for days. The "poisoned" water compounds the destruction.

There is no necessity for supposi-

WORLD'S MOST PERFECT ATOMIC TARGETS

VULNERABLE. Six of our seaports, vital arteries of commerce and industry, are open to sneak marine attack.

tion as to the effect of atomic underwater explosions in our harbors. In the Bikini lagoon we anchored 76 ships over an area of eight square miles--an area comparable to Boston harbor. We exploded one of our early-type bombs. Of the 76 ships, only nine survived in such condition that they could be decontaminated. Nine ships were sunk by the explosion, and the remaining 58 defied a two-year effort to decontaminate them and, one by one had to be towed to sea and sunk as too "poisoned" even to be reclaimed for scrap iron.

The long-awaited Bikini report shows that steel ships, either war or merchant, are the most vulnerable of all targets to atomic attack. The Russians, of course, know this since they had observers at Bikini.

Three bombs exploded in New York harbor would effectively "kill" the harbor and every ship in it. The destruction, the loss of life would be incalculable, depending on surprise, time of day, and wind direction and velocity. And if similar simultaneous attacks were made on the Canal and the other five harbors, we would be deprived of our six principal ports for much longer than the initial, perhaps the decisive, phase of the war would last--and at a cost to Russia of a score of bombs.

Moreover, the Russians have it within their power to supplement the atomic destruction through the release by fifth columnists of anthrax and other bacteria in the port areas. The Fourth Horseman of Plague would further delay recovery.

REALITY NO. 4: Immediately following the sealing of our ports we can expect Russian bombers and troop

RESTRICTED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

transports to reach Pittsburgh, Cleveland, Detroit and Chicago. This would be a secondary and far more expensive effort for the attackers, also intended to retard our recovery.

These are not fanciful suppositions but the logical deductions of qualified experts within our Government. Our Government has no way of knowing whether the Russians will launch such an attack against us; it does know, however, that the Russians can shortly have all the means for such a blow.

Much has been written about how the Russians are developing new-type submarines with German assistance. And the general assumption has been that these submarines are being designed for high-seas attack on individual ships in the traditional manner. This is an unwarranted assumption. There is no indication that the Russians ever expect to stalk convoys in the pattern of the first and second world wars.

Why should any nation ever again send out submarines to torpedo individual ships? Our six ports which the Russians can decommission handled 90 per cent of our seaborne supplies during both wars. These ports are our railheads. What would our thousands of ships be worth if they couldn't enter the harbors of Boston, New York, Baltimore, Norfolk, Seattle or San Francisco? Or if they couldn't use the Panama Canal?

REALITY NO. 5: Our counter-attack against Russia should be planned on the assumption that we will have lost indefinitely our six principal ports and the use of most of our ships. Any planning based on the large-scale employment of shipping during the initial phase of a third world war is unrealistic and unsafe.

The Russian bomb has further reduced any contribution which western Europe, even Britian, can make to the combined power of the West. No longer need there be a pretense that a dismembered Germany and a shattered France or Italy can be safeguarded if Russia chooses war.

This is not to say that we should abandon western Europe; or that we won't fight for it; or that we should cancel the Marshall plan; or even that we should cease efforts to help rebuild the continental armies. It is only to recognize a reality of our times. Indeed, prior to the fact of the Russian bomb, no military authority defended arms-for-Europe on any basis other than morale-building or aid-toward stability.

In an atomic age, with the power of the West depleted by the material and political ravages of two world wars, the counterbalance to Russia cannot be erected on the Rhine; it should be erected on the Mississippi. If Russia is to be deterred from war, the deterrent cannot be western Europe; it can only be America.

So small has the world become that in the planning for a third world war the position of western Europe is comparable to that of Belgium in the planning for the first conflict. Perhaps its people can find some comfort in the fact that it will not even be a decisive theater; that theater will be the skies over Russia or America.

The position of Britain is changed in that no one can now predict how long or how certainly Britain can be safeguarded as a base. During the

1827

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

last war, had Germany's rocket and jet development been advanced a year, Britain would have been made untenable. Britain's ports, by which she lives, are as vulnerable to underwater explosions as our own; and the close-packed island is a pitifully lucrative target for rocket and aerial atomic bursts. Even the traditional fog, an ally the last time, would be an enemy the next, since the fog would tend to hold the atomic cloud closer to the ground and retard its dissipation.

We cannot avoid being apprehensive as to how an unpredictable British government might react under atomic threat. Could some future British government be intimidated into accepting a deal with Russia? Suppose Russia should offer to by-pass Britain in return for the internment of American atomic bombs and bombers? It would be a tempting offer.

This apprehension is what lies behind our objections to any large-scale placing of atomic eggs in the British basket. Prudence requires that Britain be marked: Preliminary Base Only.

With Russia holding such advantages, how then can we establish the counter-balance—the foil which must be assembled if the free world is to have hope for peace or victory? If we must receive the first blow, if our ports can be destroyed, if our shipping can be rendered useless, if western Europe cannot be safeguarded, and if Britain can only be a "preliminary base," how can we impose our will-for-peace on the Russian adventurers?

The answer—the only answer we have--is this: Intercontinental air warfare based on the American and African continents—the American continent as the strategic base for initial retaliation; the African continent as the tactical base for the building up of air power to support ground operations aimed at ultimate occupation of enemy territory.

Russia may deal us a terrible atomic Pearl Harbor; she may occupy western Europe and neutralize Britain; she may put our ships out of action; but if, after all this, we can still master the skies over Europe, then Russia will be destroyed and we will be the ultimate victors. The continents of America and Africa provide us the strategic and tactical bases from which this can be done.

The atomic bomb did not appear until the last days of the second war. The aerial effort in that conflict was elementary compared to what it will be the next time. Yet even after the second war the scientists who made the Strategic Bombing Survey reached this conclusion:

"The experience of the Pacific war supports the findings of the survey in Europe...that no nation can long survive the free exploitation of air weapons over its homeland. For the future it is important fully to grasp the fact that enemy planes enjoying control of the skies over one's head can be as disastrous to one's country as its occupation by physical invasion."

Initially, we must base our strategic air power on North America because of two realities: 1, we have no other completely reliable base, and 2, we obviously must be in a position to deliver an instant cataclysmic retaliatory blow to neutralize the initial wound we must accept. Our means for matching Russia's initial blow is our principal hope for deterring Russia and thus having peace; therefore we must erect this

RESTRICTED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

means on the most secure of all bases—and that is our homeland.

This is why our Government has given first priority to the development of bombers capable of intercontinental warfare. And except for the dissent of a minority group of Navy admirals, our responsible planners are convinced that we already have such bombers and will shortly have even more effective ones.

The Navy minority sought to base our means for the retaliatory blow on supercarriers. The Government rejected this plan for several sound reasons which would be more apparent to the public if the Navy would release the Bikini report. The most obvious objection to the supercarrier is that in an atomic war it would stand little chance of ever leaving a harbor.

Africa becomes a full partner in this concept of the next war. Not just Mediterranean Africa, but all of Africa. In the initial phase Africa would be important as a turnaround base for our strategic bombers. A fallacy exists that immense bases are required for aircraft such as the B-36. Actually the B-36 can use any airstrip that will accept a B-29. Many such landing strips are now available on the African continent. All they are needed for--in the initial phase--is to refuel the bomber if its assigned target makes a return trip through Africa more feasible than a direct turn above the target.

But the ultimate value of Africa lies in its development as a tactical rather than a strategic base, that is in support of ground operations in the secondary effort against Russia.

The many advantages of Africa become apparent. The population is meager; the people are not particularly amenable to communism. On the entire continent, except for two harbors, there is not a lucrative atomic target. There are wide open spaces, no vast population centers which can be intimidated or made to suffer unduly. As a military base in the atomic age Africa is superior to any other continent; and Africa is the principal source of the raw materials for atomic weapons.

We should deliberately develop Africa as our potential tactical base. Efforts by American industry under the President's Point Four program should be coordinated with military planning. Railroads, modern highways and electric power for Africa could one day be the difference between defeat and victory.

We can overbalance Russia's advantages and assure peace or victory if only we are willing to plan realistically. We need not abandon hope; all the free men of the earth are on our side. In our plans there can be roles aplenty for our diplomats, our Air Force, our Navy, our Army, our industry. Our diplomats can seek peace; our Air Force can be maintained in readiness to strike; our Navy can plan to protect our harbors and to deliver our forces in the secondary phase; our Army can prepare for its traditional role; and our industry must support all of them. And in all our planning we must realize that there is a limit to our cash and credit, that our enemy is intent upon exhausting both, and therefore we must create a better war machine for less than present costs.

The Russian bomb has cast its shadow over all of us. But the Russians are realists; and if we plan intelligently, we can still hope for peace.

RECOMMENDED READING FOR YOUR OFF DUTY HOURS

TITLE: Design of Turboprop Transports, Part I

SOURCE: Flight 29 Dec 1949 (56-21-40 Wkly);pp 831-833; 4 illustration, 1 tb.

Large transport design requirements to permit the most effective use of turboprop engines are discussed. Reasons for the interdependence of the operating conditions of the turboprop and the performance characteristics of the aircraft are explained. The effect of varying the wing area and aspect ratio on operating efficiency of turboprop transports is analyzed. Factors involved in the effective use of turboprops are outlined, and curves of turboprop performance are shown for a cruising speed of 350 mph at 30,000 ft. Relationships among range, weight, and power are discussed for turboprops for various operating conditions. Dynamic response to gusts is also considered. Maximum overstress factors are shown as a function of span with altitude as a parameter.

TITLE: Civil-Military Relationships in American Life

AUTHOR: Edited by Jerome G.Kermin

PUBLISHER: The University of Chicago Press, Chicago

In eight essays by prominent educators, journalists, and public officials, this volume seeks (1) to identify the changes in conditions which have caused a greater influence of the military profession on American life, and (2) to examine how American freedoms can be preserved by safeguarding the predominance of civilian power. The book notes the historical American tradition of civilian control of the government in war as well as peace and the lack of military consciousness in America in peacetime. The various authors examine America's civil-military relationships in the light of our postwar policy of maintaining large-scale military forces until international organizations become strong enough to replace national force. The essays cover the following subjects: "Science, Technology, and War," "From Soldier to Citizen," "The Recruitment and Training of the New Armed Forces," "Civilian Control of a Department of National Defense," "Government of Conquered and Dependent Areas," "The Military and Foreign Policy," "Civil-Military Relations in the United Nations," and "Security Without Militarism: Preserving Civilian Control in American Political Institutions."

THIS PAGE IS UNCLASSIFIED

boats. Among those described are the American JRM Mars and XP5Y-1; the British SR-45 Princess and Short Solent 2; and the French Latecoere 631 and SUD-EST S. E. 1210. The credit of establishing and maintaining the world's overseas airways goes to the flying boat. Beginning with the construction of the "America" in 1914 and the Curtiss NC's in 1919, flying boats have, until just recently, been larger than their landplane contemporaries; yet the possibility of flying boats seems by no means exhausted. Hughes' 400,000-lb "Hercules," the largest flying boat in the world, appeared in 1945 and was flown in November 1947. It was designed to carry a payload equivalent of a 60-ton tank with full complement of armor and men, or 750 soldiers fully equipped.

CADO 1 Apr 50 Uncl

TITLE: Any Future for the Flying Boat?

AUTHOR: A. R. Boone

SOURCE: Air Trails
775 Lidgerwood Avenue
P.O. Box 489
Elizabeth, N.J.

Research conducted by Convair in the design of hulls using radio-controlled models now points the way to supersonic seaplanes. Flying-boat development, however, must progress first through the subsonic phase, which is to be realized soon in the 5Y-1 which should be flying by midspring. It is estimated that the 5Y-1 will cruise at 350 mph. Later comes the transonic, then the supersonic. Progress in the latter two phases is largely under wraps. It has been publicly stated, however, that research already has entered the transonic phase. At least one jet-propelled model is flying now. Now that the new conception of water-based airplanes has actually produced the 5Y-1--it is actually in being, and not merely a dream--we begin to recognize the significance of this development. Transonic water-based planes can be built today, not next year. From this fact, too, it is possible to speculate on their strategic uses in event of war. Vessels of other types in conjunction with midocean docking or mooring facilities can handle fueling and repair. With coming designs, it will be possible to water-base aircraft and lose nothing in performance.

CADO 1 Apr 50 Uncl

TITLE: Medical Aspects of the Atomic Bomb

AUTHOR: Maj. G. M. McDonnel

SOURCE: Ordnance Mar-Apr 1950
705 Mills Building
Washington 6, D. C.

Atomic casualties, which are produced as a result of blast, heat, and ionizing radiation, are discussed. The relative value of these agents determined by a scale of biological significance will vary primarily with the type of detonation, namely in the air, on or near the ground, and under water. With an air detonation, the ranges of the blast and thermal effects are distributed over the greatest possible area. In the ground detonation the ranges of blast, heat, and ionizing radiation are less than the air-detonation values. The heat and initial ionizing radiation produced as a result of an underwater detonation are largely contained within the surrounding water. It is stated that the danger from radiation has been highly overrated.

AIR FORCE LETTER)
NO. 205-25)

DEPARTMENT OF THE AIR FORCE
WASHINGTON, 30 MARCH 1949

SECURITY

Disclosure of Classified Information to Reserve Forces Personnel

(Effective until 30 September 1950 unless sooner rescinded or superseded.)

	Paragraph
Purpose	1
Scope	2
Policy	3
Investigation and Clearance	4
Residents of Foreign Countries and Foreign Nationals	5
Requirements	6

1. Purpose. To provide uniformity, this Letter outlines the policy of the Air Force with respect to the dissemination of classified military information to Reserve Forces personnel.

2. Scope. This Letter applies to the Air Force Reserve and the Air National Guard, and in addition, its provisions will be followed in connection with activities concerning the Air Reserve Officers' Training Corps and the Senior Division of the Civil Air Patrol. This Letter does not apply, however, to personnel on extended active duty.

3. Policy. In compliance with the provisions of AFR 205-1 regarding security of military information, Reserve Forces personnel may be entrusted with classified information as follows:

a. RESTRICTED information may be disseminated for official military purposes to any Reserve Forces personnel.

b. Except as authorized in c below, information classified no higher than CONFIDENTIAL may be disclosed to Reserve Forces personnel not on active duty who are actively participating in official training activities, provided that possession of the information is essential to the training course or program.

c. SECRET information may be disclosed to Reserve Forces personnel on active duty for training purposes and personnel not on active duty who have a mobilization assignment, provided that possession of the information is necessary in the performance of official assigned duties.

d. TOP SECRET material will not be used for training purposes in connection with Reserve Forces training programs. As authorized by paragraph 7, AFR 205-1, 14 March 1949, however, individuals serving on short periods of active duty whose assignments require it may be given access to the TOP SECRET information essential for the performance of their assigned duties.

e. Documents containing information classified higher than RESTRICTED will not be disseminated for retention by individuals. Such documents will be stored in military files only.

f. Reserve Forces personnel not on active duty who receive classified information will be informed that the information affects the National defense of the United States within the meaning of the Espionage Laws and that its revelation or transmission to an unauthorized person is prohibited.

g. Upon termination of active duty training, personnel will be briefed on the necessity for maintaining security of their professional knowledge while on inactive status.

4. Investigation and Clearance. Commanders concerned are responsible for requesting personnel security investigations and clearing personnel referred to in this Letter whenever required or necessary in accordance with separate Regulations.

5. Residents of Foreign Countries and Foreign Nationals. The provisions of AFL 182-4 and 8f, AFR 205-1, 14 March 1949, will be observed regarding dissemination of military information to persons residing in foreign countries, or to foreign nationals as defined in paragraph 2i, AFR 205-1.

6. Requirements. Although it is the desire of the Air Force to make available to Reserve Forces personnel such classified information as is required for training purposes within established training programs and courses, it is of primary concern that no breach of security will result from this policy. Commanders concerned will review continuously all classified material required by or of direct value to Reserve Forces activities, and whenever appropriate, will initiate down-grading action thereon in accordance with paragraph 27, AFR 205-1, 14 March 1949.

BY ORDER OF THE SECRETARY OF THE AIR FORCE:

- - - - - -

*This Letter supersedes AFL 205-25 (formerly 46-7), 31 March 1948.
This Letter has been coordinated with and approved by the Chief, National Guard Bureau, as being applicable to the Air National Guard.

SUPERSONIC RAM-JET TEST CHAMBER

A new supersonic ram-jet engine test chamber which can simulate flight speeds up to 2,600 miles per hour—about four times the speed of sound—and altitude conditions up to 80,000 feet, has been developed for the Air Force by the Wright Aeronautical Corporation of Wood-Ridge, New Jersey.

The test chamber, which is 12 feet in diameter and 96 feet long, was designed particularly for the development of supersonic ram-jet engines and is part of a multi-million dollar facility at Wood-Ridge capable of testing all types of engines, including turbo-props and turbo-jets. Ram-jets up to 20 inches in diameter may be operated in the new test chamber at the present time. Future modifications will make it possible to test units twice that size.

In a typical test, a ram-jet is mounted on a platform in the center of the 12-by-96-foot stainless steel chamber. Air, supplied by turbine compressors in the adjacent turbine laboratory, is directed at supersonic speeds through a "mouth", 20 inches in diameter, at the front of the chamber into the air intake duct of the ram-jet engine. The motors which drive the air compressors are capable of producing 15,000 horsepower, and the compressors can deliver air to the rate of 140 tons per hour. Pressurized steam at the rate of 150 tons per hour is vented into the chamber's exhaust system to aid in the escape of exhaust gases from the ram-jet, and to reduce pressure in the chamber, thereby simulating "high-altitude" conditions. By varying the incoming air pressure and the outlet steam pressure, it is possible to "starve" or "overfeed" the engine, thereby effecting altitude and speed changes. The thrust generated by the engine being tested is measured by an electronic thrust computer attached to the engines.

To muffle the roar of exhaust gases and steam jets near the rear of the chamber, three cylindrical silencers, each 45 feet high, have been installed at the end of the exhaust line. Because of the 4,000 degree temperature of exhaust gases, the chamber is cooled by a jacket of circulating water for cooling and is set on rollers to allow for a one-inch heat-induced expansion.

WAS THE SECOND FRONT IN THE AIR A MYTH?

In line with current Soviet propaganda claiming credit for all important accomplishments in all fields of activity, Red Star of 13 March 1949 carries an article entitled, "The Myth of the 'Second Front' in the Air," written by Soviet Colonel N. Chistov. The author bases his entire article on the premise that in World War II Anglo-American "ruling circles" held far-reaching concealed aims, did not want to expand combat operations in the west, and that, to cover their policies, purposely exaggerated the Anglo-American air bombing of Germany as a second front. He seeks to prove that the 1000-plane Allied raids on Germany during the conflict were actually ineffectual, and that the war burden was carried by Russia more or less alone. It is a classic example of the type of thing fed the Russian people daily by their Kremlin masters.

The tenor of Chistov's article is revealed in its opening paragraph: "During the World War (II), and at

FIESLER AIRCRAFT PLANT NEAR KASSEL. Admitted Dr. Hjalmar Schacht: "Your bombers destroyed German production and...made the defeat of Germany certain."

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

times even now, in the foreign military press the 'decisive' role of the Anglo-American Air Forces in the combat operations against Fascist Germany is praised in every possible way. However, those who make such declarations purposely refrain from observing that the rout of the Hitlerite military machine took place on the Soviet-German front under the powerful blows of the Soviet Armed Forces. It is precisely here that the main forces of Hitlerite Germany were concentrated and operated. The whole course of the war depended on the outcome of the struggle on the Soviet-German front."

Chistov then asserts that many Anglo-American spokesmen verbally subscribed to Italian General Douhet's theory that victory in warfare could be achieved by complete rout of the enemy through powerful blows from the air, followed by occupation by navy and ground forces after the enemy had capitulated. Profession of this theory is said to have served to conceal the slow operations of the Allied armies as well as "aspirations which had nothing in common with the desire to participate actively in the struggle against the German fascist aggressors." This latter innuendo is not clarified.

Having made his assertions and charges, Chistov sets forth to prove concurrently that the Douhet theory was false and to minimize the value of Anglo-American air activities over Germany. Says he: "...Let us turn to the facts published in the press(?) since they open up the true significance of the notorious 'second front' in the air. Thus, according to official date, in 1944 American strategic bombers alone threw 446,000 tons of bombs in the European theater of operations. The Air Forces of the English threw 525,000 tons. And so, nearly a million tons of bombs were thrown on Hitlerite Germany. Nevertheless it continued the struggle...(Some English and Americans had)...promised to put Germany on its knees in half a year; in actuality, however, even after aerial bombardment of a greater scale than they had proposed, Germany continued to resist."

A quotation from the Summary Report of the United States Strategic Bombing Survey (European War), dated 30 September 1945, will clarify this circumstance of continued German resistance referred to by Chistov:

"The German experience suggests that even a first class military power--rugged and resilient as Germany was--cannot live long under full-scale and free exploitation of air weapons over the heart of its territory. By the beginning of 1945, before the invasion of the homeland itself, Germany was reaching a state of helplessness. Her armament production was falling irretrievably, orderliness in effort was disappearing, and total disruption and disintegration were well along. Her Armies were still in the field. But with the impending collapse of the supporting economy, the indications are convincing that they would have had to cease fighting--any effective fighting--within a few months. Germany was mortally wounded."

Chistov continues: "More than that, in January 1945 the Anglo-American troops in Western Europe were in such a position that it became necessary to save them from defeat by the immediate development of offensive operations on the part of our forces in the district of the Vistula and Danube."

But, according to the Survey, "when the Germans launched their counter-offensive on December 16,

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

CREIL MARSHALLING YARD. Stated General Jahn: "The attacks on the German transport system...had a paralyzing effect on... all German industry."

1944, their preserves and fuel were insufficient to support the operation. They counted on capturing Allied stocks. Failing in this, many panzer units were lost when they ran out of gasoline." And at this late date, Germany's transportation system had been so badly mauled by Allied bombings that "the Ardennes counter-offensive, the troops and equipment for which were marshalled over the railroads, was probably the last such effort of which the Reichsbahn would have been capable in the west."

Some more from Chistov: "...As we know, after the war the American management for the study of strategic bombardments sent special commissions to Germany and Japan. This management then published a number of documents. In analyzing these documents, Colonel Tarle writes (in the journal, The French Air Forces, Vol. No. 24, 1948): 'The tactics of strategic bombardments did not produce the results the Anglo-American command had expected. When the Allies occupied Germany they were astonished at the number and importance of subterranean plants.'..."

The Bombing Survey does not bear out this assertion. On the contrary, the following quotation therefrom actually refutes it:

"...Germany never succeeded in placing any substantial portion of her war production underground--the effort was largely limited to certain types of aircraft, their components, and the V weapons. The practicability of going underground as the escape from full and free exploitation of the air is highly questionable; it was so considered by the Germans themselves. Such passive defenses may be worthwhile and important but it may be doubted if there is any escape from air domination by an enemy."

At this point, Chistov quotes German aircraft production figures to show that the Anglo-American Air Forces were unsuccessful in their

RESTRICTED

1837

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

attempts to destroy German aircraft production. Says he:

"Notwithstanding the attacks on the airdromes and aircraft factories, the production of German aircraft rose from 8,925 in 1939 to 15,596 in 1942 to 39,807 in 1944. In 1944 three times more bombers and eight times more night fighters were produced than in 1942.

"One cannot but note the fact that the strong German Air Forces were, of course, routed not at their home air bases but in the fierce aerial combat on Soviet-German front. It is precisely here, in the skies of Moscow, Stalingrad, over Belorussia and the Ukraine, that the Soviet pilots destroyed the main force of the Hitlerite Air Force (50,000-60,000 aircraft), and having achieved complete supremacy in the air made it much easier for the Anglo-American Air Forces to conduct their operations."

Chistov, of course, relates and asserts only what suits the Soviet purpose. While it is true that the Allied effort to destroy the German aircraft (airframe) industry was not a complete success, it did cripple and hinder the German effort. It will be noted below that Chistov nowhere mentions the result of the Allied attack on Germany's oil—and aviation gas—production, vital to tanks, armored vehicles, and to flying aircraft produced.

According to the US Strategic Bombing Survey, the German oil supply was tight throughout the war, and was a controlling factor in military operations. The chief source of supply, and the only source of aviation gasoline, was 13 synthetic plants together with small production begun from 3 additional ones that started operations in 1944. A preliminary attack was launched on 12 May 1944, followed by another on 28

WRECKED BALL-BEARING WORKS AT PARIS. Cried the general manager of Junkers Italy: "The attacks on the ball-bearing industry were an unqualified succe and disorganized Germany's entire war production."

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

May; the main blow was not struck, however, until after D-day. (In the months before D-day and for a shorter period immediately following, all available air power based in England was devoted to insuring the success of the invasion.)

A quotation from the Survey clearly tells the story:

"Production from the synthetic plants declined steadily and by July 1944 every major plant had been hit. These plants were producing an average of 316,000 tons per month when the attacks began. Their production fell to 107,000 tons in June and 17,000 tons in September. Output of aviation gasoline from synthetic plants dropped from 175,000 tons in April to 30,000 tons in July and 5,000 tons in September. Production recovered somewhat in November and December, but for the rest of the war was but a fraction of the pre-attack output.

"The Germans viewed the attacks as catastrophic. In a series of letters to Hitler, among documents seized by the Survey, the developing crisis is outlined month by month in detail. On June 30, Speer wrote: 'The enemy had succeeded in increasing our losses of aviation gasoline up to 90% by June 22nd.'

"... In August(1944) the final run-in-time for aircraft engines was cut from two hours to one-half hour. For lack of fuel, pilot training, previously cut down,was further curtailed..."

Chistov continues: "Admiral Kastex, in his article,'The Irreproachable Doctrine', in the journal, The French Air Forces,Vol. No. 27, 1948, points out that about 30% of the total bomb tonnage of the Anglo-American strategic bombers was thrown on German cities, and the result was quite mediocre. Chemical plants suffered but slight damage. Ball-bearing works suffered so little that at the end of 1944 they were producing a normal amount of goods. The production of powder and explosives rose in 1944 to 171% of 1942. The production of tanks rose from 100% in 1940 to 1269% in 1944."

Now, according to the Bombing Survey, the order of priority for attack on German industry was as follows:

1. Submarine bases and pens(1942)
2. German aircraft (airframe) industry,including ball-bearing plants (June 1943)
3. Marshalling yards and bridges in France prior to the Normandy invasion (Spring 1944)
4. The oil industry, including synthetic nitrogen, methanol, and synthetic rubber (May 1944)
5. Steel and transportation system of the Ruhr (Mid-1944)
6. German transportation system (Sept 1944).

In the spring of 1943, Allied naval and air power scored a definite victory over German submarines. The attack on the German aircraft industry--primarily on airframe plants --was opened in the summer of 1943. The attack on the aircraft plants, like the attack on the ball-bearing plants, showed that to knock out a single industry with the weapons available in 1943 and early 1944 was a formidable enterprise demanding continuous attacks to effect complete results. Recovery was improvised almost as quickly as the plants were knocked out.

But the attack on the oil industry can be termed a great success. Consumption of oil exceeded production from May 1944 on. Accumulated stocks

THIS PAGE IS DECLASSIFIED IAW EO 13526

DAMAGE AT PLOESTI. *Said Generalmajor Albrecht von Nasson:* *"The attack on German oil production opened in 1944 was the largest factor of all in reducing our war potential."*

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

were rapidly used up, and in six months were practically exhausted. The loss of oil production was sharply felt by the armed forces. Through the summer, the movement of German Panzer Divisions in the field was hampered more and more seriously as a result of losses in combat and mounting transportation difficulties, together with the fall in fuel production. By December, according to Speer, the fuel shortage had reached catastrophic proportions. For example, in February and March of 1945 the Germans massed 1200 tanks on the Baranov bridgehead at the Vistula to check the Russians. They were immobilized and overrun for lack of gasoline.

The attack on the synthetic oil plants also cost Germany its synthetic nitrogen and methanol supply and a considerable part of its rubber supply. It became necessary to fill shells with a mixture of explosives and non-explosive rock salt extender. There was a general shortage of ammunition on all fronts at the end of the war.

"The loss of methanol coupled with the reduction in nitrogen was followed by a precipitate decline in production of explosives." (US Bombing Survey.)

During the last half of 1944 both the cities and transportation system of the Ruhr were the targets of extremely heavy attack, primarily by the RAF. Production of steel in the Ruhr was reduced by 80% between June and the end of the year. Steel shortage might have been decisive if the war had continued.

The attack on Germany's transportation system was the decisive blow that completely disorganized the German economy. It reduced war production in all categories and made it difficult to move to the front that which was produced. The attack also limited the tactical mobility of the German Army. The attack on the waterways paralleled that on the railways; investigation showed that it was even more successful. On 23 September 1944 the Dortmund-Ems and Mittelland canals were blocked, stopping all through water traffic between the Ruhr and points on the north coast and in central Germany.

The Bombing Survey quotes Speer's reporting to Hitler, March 15, 1945: "The German economy is heading for inevitable collapse within 4-8 weeks."

What the Allied planners really overlooked was the German power system, which, except for isolated raids, was never a target during the air war. An attack was extensively debated during the course of the war. It was not undertaken, partly because it was believed that the German power grid was highly developed and that losses in one area could be compensated by switching power from another. This assumption was incorrect. Generating and distributing facilities were relatively vulnerable and their recuperation was difficult and time consuming. Had electric generating plants and substations been made primary targets as soon as they could have been brought within the range of Allied attacks, the evidence indicates that their destruction would have had serious effects on Germany's war production.

Chistov continues: "Such...facts ...are witness to the unsoundness of the endeavors to palm off the myth about the decisive operations of the Anglo-American Air Forces as a strictly carried out theory of separate air warfare with a definite scientific basis. We must note that during the war there were many com-

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

mon sense statements abroad that rejected the attempt to foist upon the public the view of aerial bombing as a second front...The Chief of Staff of the English Air Forces (Tedder) likewise did not agree that the war could be won by the operations of bomber aviation alone.

"Soviet fighters during the whole of the heroic struggle against the German fascist armies closely watched the development of military operations in the West. They clearly understood that these operations could in no way be considered the real second front in Europe, because, notwithstanding the mass use of aircraft and its increased role in warfare, victory could only be achieved when all the armed forces took part in the engagements, including the ground armies...Only the heroic struggle of the Soviet Armed Forces, which in the course of several years alone fought fascist Germany and could by themselves, without the help of outside, break completely the Hitlerite military machine and liberate Europe from the German fascist invaders, only this struggle forced the ruling circles of the Allies to speed up the landing of ground armies in France."

But neither historical fact nor the Survey itself, heretofore quoted, backs Chistov's inferences and assertions.

THE ALLIED STRATEGIC PLANS

Chistov then concludes:

"Thus, the course of military operations alone on the Soviet-German front dispersed the myth about the decisive operations of the Anglo-American strategic Air Forces.

"In both the RAF and the USAF there were some who believed that air power could deliver the knockout blow against Germany, and force capitulation. This view, however, was not controlling in the overall Allied strategic plan. The dominant element in that plan was invasion of the Continent to occur in the spring of 1944." Plans called for establishing air superiority prior to the date of the invasion and the exploitation of such superiority in weakening the enemy's will and capacity to resist.

Allied air power was decisive in the war in Western Europe. Hindsight inevitably suggests that it might have been employed differently or better in some respects. Nevertheless, it was decisive. In the air, its victory was complete. At sea,

HERMANN GOERING: "Without the U.S. Air Force, the war would still be going on elsewhere, but certainly not on German soil."

1842

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

its contribution, combined with naval power, brought an end to the enemy's greatest naval threat--the U-boat; on land, it helped turn the tide overwhelmingly in favor of Allied ground forces. Its power and superiority made possible the success of the invasion. It brought the economy which sustained the enemy's armed forces to virtual collapse although the full effects of this collapse had not reached the enemy's front lines when they were overrun by Allied forces. It brought home to the German people the full impact of modern war with all its horror and suffering. Its imprint on the German nation will be lasting.

In spite of Chistov's assertions, it is clear from historical facts, some of which are set forth herein, that the second front in the air during World War II over Europe was no myth. It is also clear that this second front in the air--this attack against Germany proper and the German economy--was part of a larger strategic plan which contemplated and led to the re-opening of the second front on the ground of Western Europe by the Allies in the spring of 1944. Furthermore, it seems more than coincidence that swift Russian advances in Eastern Europe in 1944 and 1945 followed upon the destruction of German industry and transportation during 1944 by Anglo-American Air Forces. It is to be doubted that the Kremlin values the Chistov article as anything but propaganda for consumption by the credulous.

Air Intel Summary Vol IV No.7 .Rest

No nation should ever permit itself to be frozen to any static concept--whether that concept is the crossbow, or gunpowder, or the Maginot Line, sea power or air power, or the atomic bomb.-James Forrestal

REORGANIZATION OF SAC

A reorganization of the three air forces which comprise the Strategic Air Command to provide each with similar capabilities and components to perform their strategic missions took effect April 1.

The reorganization assigns SAC bases in the western part of the U.S. to the Fifteenth AF with headquarters at March AFB, Riverside, California; SAC bases in the central U.S. to the Eighth AF with headquarters at Carswell AFB, Texas; and those in the eastern U.S. to the Second Air Force with headquarters at Barksdale AFB, La.

A major change in reorganization is in the reconnaissance forces. Formerly all SAC reconnaissance units were assigned to the Second AF. The reorganization gives each of SAC's air forces its own reconnaissance and bombing capabilities, thus enabling it to work as an independent Air Force. Geographical reorganization also permits improved supervision at less cost in travel time and man hours.

Since both the 5th and 9th Strat Rcn Wgs are presently located at Fairfield-Suisun AFB, California, the Air Force plans to redesignate the 9th Strat Rcn Wg and the 28th Bomb Wg at Rapid City AFB, S.D., as the 28th Strat Rcn Wg. The 9th and 28th Wings will be equipped with 30 B-36 type aircraft when they become available. Personnel of the 9th Reconnaissance Technical Sq located at Fairfield-Suisun AFB will be transferred to Rapid City AFB and the unit will become the 28th Reconnaissance Technical Squadron.

POLAR GUIDE

THIS IS THE ELEVENTH OF A SERIES OF ARTICLES ON ARCTIC INDOCTRINATION

Chapter 18--Land Survival (Continued)

LIVING OFF THE COUNTRY

FOOD ANIMALS, BIRDS, AND FISH

In most parts of the polar regions, animals are to be found all year around, on land, in lakes, and in the sea. Virtually, all animals are edible. If you are forced by necessity to live for several weeks on an all meat diet, be sure to eat plenty of liver.

Do not, however, eat the livers of polar bears or bearded seals. The livers of these animals contain a tremendous concentration of Vitamin A and will make you sick.

CARIBOU. Caribou usually travel in herds. They are found on the tundra in both winter and summer. Sometimes in summer, they are also found on off-shore islands. Whether caribou are plentiful or not, shoot only as many as you require. Consider the Eskimos, whose need for food and clothing is as great as yours and whose friendship is essential. In shooting, aim for the shoulder or neck rather than the head; antler prongs make the head a deceptive target. Soft-nosed bullets are more effective than the steel-jacketed.

Skin caribou promptly, especially in summer. If you do not have time for skinning, at least remove the entrails. When skinning, keep the fat with the carcass rather than the skin. (These suggestions apply to other large animals as well). The caribou's stomach contents (mixed with oil or blubber) can be eaten. So can the eyes, brain, bone marrow, tongue, entrails, and especially the liver. Caribou meat freezes quickly in winter. Kept frozen and snow-covered, it will last indefinitely.

MOOSE. Moose are excellent food animals. Look for them in or near lakes or swamps. In clear, cold weather you can best spot a moose or caribou by climbing a hill or tree and looking for the animal's "smoke" which rises like the smoke of a camp fire.

MUSK OXEN. Musk oxen are most abundant today on little-known islands north of the continent proper. They live in the wildest, most remote barrens and seek meadowlands

Caribou.

RESTRICTED

1844

Moose.

Musk ox.

between hills and ridges. Keep on the lookout for tufts of their long, dark-grey hair and their soft wool on boulders in muddy spots. They live on grasses, heather, and small bushes, and, when necessary, will eat moss and lichens.

Musk oxen are easier to stalk and shoot than caribou. If possible, approach and shoot them from behind cover. If they are startled, they may clatter up the nearest hill and bunch tightly together, facing you with lowered horns. In that case your approach is easy. But face and forehead shots are almost sure to be wasted; a neck or shoulder shot is the surest. In winter, skin animals quickly before the meat freezes solid. Prepare the meat as you would caribou.

SEALS. Seals are widely distributed and generally common. Their flesh and liver are excellent food. (Do not eat the livers of bearded seals.) In summer and autumn, seals come to the surface of the water in order to breathe, and as their heads pop up, they make good targets. Seals sink in fresh water all year around and in salt water from May through October. They generally float in salt water from November through April. When hunting seals, stay down-current from them, if possible, so the current will bring them to you. Concentrate on one animal and shoot at the head, neck, or shoulders. Seals shot in the lungs or stomach usually escape.

Another method of getting seals in the summer and autumn is to catch them in coarse nets made of strips of animal skin or rope with a mesh about nine inches square. The nets are usually floated across narrow channels through which seals are known to pass. An all-service, large-meshed net may be equally good for catching seals and young white whales.

In the winter the best place to hunt seal is in openings (leads) in the pack ice. You will frequently find quite a number of seals at the leads and they will be easier to shoot there than at their breathing holes. Carry along your fishing line, hook, weight, and cork. You will need these in order to retrieve you seal--the weight in order to

1845

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

be able to throw the line far enough and the cork to keep the hook afloat on the water. After you have killed the seal, toss the line, weight, and cork over the lead on the far side of the seal. Then gradually pull the line until the hook is near the seal, jerk it slightly to catch in the seal's skin, and pull the seal over to the edge of the lead where you can retrieve it. If you are careful, even a small hook will do the job.

Shooting seals at breathing holes and retrieving them is much more difficult and requires considerable patience. Generally, seals make a number of breathing holes within a fairly small area and when you find one hole you can be relatively sure that there are others in the vicinity. These holes are depressions in the center of little mounds of ice built up over the surface. The mounds result from the fact that each time a seal comes to breathe at the hole he has to break through the ice that formed over the hole since the last time he breathed there, and this ice gradually piles up around the hole to form a mound. To kill and retrieve the seal you will need some kind of spear or gig in addition to your gun.

If you are alone, the only thing to do is to wait patiently, practically at the edge of the hole, holding your gun in position to shoot the seal as soon as his head pushes up. The seal will not keep his head above the water very long and you must be ready for an instant shot. Have your spear or gig very close by so that you can spear him as soon as you shoot; otherwise he might be lost under the water.

If there are a number of crew members hunting together, locate all the seal's breathing holes in a given vicinity and place one man equipped as previously described at a centrally located breathing hole. Then have the others stomp about at each of the other holes so that the seal will have only one breathing hole at which to come up. This will make it more likely for the seal to come up at the particular hole being guarded.

In the spring, seals lie on the surface of the ice next to their breathing holes and bask in the sun. A basking seal is hard to approach and, unless killed instantly by a shot in the head, it slips down into its hole and is lost. Approach the

Hair Seal.

Polar bear.

1846

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

seal by pretending you are a seal also. Eskimos know that seals lying on the ice sleep in a series of short naps, generally lasting about a minute or less, separated by quick glances about. So the Eskimo lies flat on the ice and gradually works closer, moving forward while the seal naps. Should the seal see him moving and become fidgety, the Eskimo raises his head and looks around as a seal does. The chances then are that the seal will mistake the hunter for another seal and will no longer be worried. However, you should observe two rules. One is not to dress in white, for if you do the seal might mistake you for a polar bear, become frightened, and leave the spot. The other is not to approach the seal directly.

The fresh liver, heart, and kidney of the seal are choice parts, exceptionally rich in food value. You can make the oily flavor somewhat less pronounced by carefully removing the blubber and blood from the meat. The blood is edible, however, and you should save it. Eskimos sometimes eat the liver raw, fresh from the body. You will prefer it broiled or fried. If you broil seal meat, put some fat with it. The easiest way to prepare it, though, is to cut off chunks and put them in

Mountain sheep.

Hare.

water to boil. Don't boil the meat too long because that destroys the vitamins. By putting blubber in with the meat when you boil it, you can get a pressure-cooker effect, for the fat will form a layer on top of the water that will act somewhat like a sealed lid.

Before you store seal meat, carefully remove the blubber; otherwise it will turn rancid and will not be fit to eat.

POLAR BEARS. Unless you have a powerful, high-velocity, big-game rifle, it is not a good idea to hunt for polar bears. Bears are hard to kill and a wounded bear is very dangerous. Of course, it is possible that the bear will approach you, for polar bears, as well as brown, grizzly, and black bears are born raiders and may be quite aggressive. In that case, shoot the .22 caliber barrel of your survival gun to sever the spinal column, cut an artery in the heart, or penetrate the brain. If this fails, wait until the last possible moment before firing the .410 barrel. If you fire it into the bear's face at point-blank range,

Marmot.

say at 8 to 10 feet, it will stop or blind him.

MOUNTAIN SHEEP. If you are stranded in the mountains of Alaska, mountain sheep (big-horn) may be almost your only source of meat. Because the sheep are usually found high up on the slopes, hunting them usually means stalking and long shots, and retrieving your game may be hazardous. The hunt is never easy but it may help to remember that all mountain sheep are less suspicious of anything they see or hear above them than of what they see or hear below.

MOUNTAIN GOATS. The goat is not as good to eat as the mountain sheep but meat is meat when you are hungry. Furthermore, the goat is not very difficult to stalk, once you have climbed up to the goat zone.

WOLVES. The wolf is edible, and its fur may be used for clothing. It is almost sure to be found wherever there are caribou or reindeer. Being clever, it may rob a trap line for weeks at a stretch without allowing itself to be seen by the trapper.

FOXES. Fox meat is edible. The fur is warm but not durable; hence it is not usually used for clothing. Foxes are keen-eared and curious. Conceal yourself well and lure them out for a good shot by vigorously kissing the back of your hand in imitation of a wounded bird or mouse. Or you can make a fox-trap by building up a dome-shaped structure of stones or snow-blocks, about eight to ten feet in diameter, five feet high, and open at the top. The walls should slope in strongly. Bait the trap with a chunk of meat. The fox will climb the structure, jump into the trap from the top to get the meat and then will be unable to get out.

HARES. Hares are common in the polar regions. The simplest method for getting polar hares is to hunt them with a rifle. Firing a gun along a cliff will sometimes set a dozen hares running. A running hare is a tricky target; do not waste ammunition on it. But a sharp whistle often halts the hare just long enough for a successful shot. You can snare hares easily in clumps of shrub willows where they feed. Set your snare either along a used runway or in thick shrubbery in a willow clump. You can make a simple snare by attaching a wire noose to a growing twig. Make a passage by thrusting a

Mountain goat.

Wolf.

stick into the earth opposite this twig, and running a fence of sticks out from these two main pillars so that the hare is forced to use the opening. The noose (about 4 1/2 inches in diameter) should hang in the opening and should be from six to eight inches above the ground at its base. Try to visit your snares at least twice a day. If you do not, a fox may eat your catch.

When you eat hare, be sure to eat its blubber or other fat as well. Hares are rarely fat, and you need fat in the polar regions. Although you will lose weight steadily on a continuous diet of lean hares, it is better to eat hares than to starve to death.

MARMOTS. The hoary marmot, a woodchuck-like animal, is good-sized and makes excellent food. In late summer, before hibernation, it is very fat. You can catch a marmot in a steel trap set at the mouth of its burrow, or you can shoot it. Do not fire, however, until it is some distance away from its den and is perched on a boulder. In the summer, if you have no gun, cut it off from its burrow. It will run straight past or over your feet and you can kill it with a stout stick or a stone.

LEMMINGS. If you cannot get larger game, you might have to eat these polar mice. In summer, look for lemmings under rocks or scuttling along their runways in the moss or grass. You can often catch them with your hands. In winter, their nests are on or near the ground, deep in snow drifts. You can catch them by setting snares of very fine wire along their winter runways, but be sure to cover completely the cutaway parts of the burrow where your trap or snare is set, because lemmings seem to avoid light. Another difficulty in trapping these animals is that shrews, weasels, or other lemmings may eat your catch.

PORCUPINES. The non-hibernating porcupine ranges northward to the very limit of trees, reaching even northern Labrador where animal life is scarce. It often sleeps high in a tree curled up near the trunk. Kill porcupines with a club and save your ammunition. Be careful of the spines.

Hare snare.

THIS PAGE IS UNCLASSIFIED

MUSKRATS. These rodents range northward to the tree limit. They inhabit streams and marshes and build a moundlike house of grass, with an entrance below water. If you open this house quickly, you may surprise a drowsy animal, or, in late spring or summer, find a brood of young. In winter, it may be worth your while to follow a fresh muskrat track that leads away from water. Muskrats sometimes wander into the uplands where they can be caught easily.

SQUIRRELS. The red squirrel lives in the evergreen woods of Canada and Alaska. It doesn't hibernate. To lure it close for a shot, stand still a moment, then start kissing the back of your hand loudly.

Westward along the Arctic Ocean from Hudson Bay, you may be able to get a ground squirrel during summer

Porcupine.

Muskrat.

Squirrel.

(but not in winter, for it hibernates) with a snare placed at the mouth of its burrow or with a simple deadfall made of a flat, heavy stone propped up with a short stick and baited with grass, grain or other food.

OTHER ANIMALS. The beaver, mink, fisher, pine marten, otter, and Canadian lynx range well northward in wooded parts of Canada and Alaska. They are edible. Because they don't hibernate, they are a possible source of food in winter. The wolverine ranges far into the tundra, and even throughout Baffin Island. It is tough and evil-smelling, but it is edible.

Look for animals in holes in rotten standing trees. In winter, trees may be inhabited by flying squirrels, mice, and owls. In summer, woodpeckers, owls, and small mammals frequently nest in them. A big cavity in a tree near a river may contain a "goldeneye" duck's nest. Rap on rotten trees as you pass--animals may emerge from them.

COUP OPERATIONS

A coup operation is a military operation executed in such a way as to surprise the defender and to create an advantage for the attacker.

Generally speaking there are two purposes of a coup operation. First, its purpose may be to obtain influence or power. Second, it may be intended to inflict serious damage on a country, such as on its defense installations or resources. Measures of the latter type open the way for an attacker to obtain considerable advantage for himself, even though he uses limited or very small forces. This is especially true just before or during the early phases of open hostilities. A coup can also be carried out under peacetime conditions, as a preparation for subsequent operations.

THE OBJECTIVES OF A COUP

It may be expected that the objective of a coup operation will be one or more of the following: the nation's defense and administration; its natural resources; manufacturing facilities; or the inhabitants themselves. The choice in any particular case naturally depends on the objectives of the attacker's subsequent operations. Selection of the target is influenced by many different factors which must be taken into account at the time of the attack. One factor which is always likely to be of influence is the desire to create substantial advantages for the attacker or to inflict serious damage on the adversary with only a limited engagement of forces.

In both civilian and military defense, it should be expected that the objectives would be installations and supplies of various kinds. By seizing or destroying these, the technical and material resources of the defense can be seriously reduced. The same is true, broadly speaking, where coup operations are successfully carried out against war industries. The effects of such operations are immediately felt when the affected industries are engaged in the final stage of a manufacturing process. Damage inflicted on communications can seriously hamper and retard vitally needed transportation and may be of catastrophic consequences to the defense. This will be especially true where transportation concerned with mobilization and concentration is affected. Coup operations against laboratories and other research establishments may have serious future consequences, due to the fact that irreplaceable apparatus or instruments may be destroyed or valuable research data may be seized by the enemy.

In the sphere of administration, coup operations directed against various elements of a country's central administration, including the higher military staffs, may give an adversary particularly valuable information concerning defense plans and resources before actual warfare has begun. After the outbreak of war, such operations can give the attacker certain advantages, due to the fact that difficulties and chaos are produced in the conduct of the defense. Control of the propaganda and communication facilities of a nation in the early stages of a war gives the attacker an opportunity to undermine a nation's army and to reduce its power of resistance. The nation's defense may also be disorganized by false communications.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

In the field of a country's resources, as in its military defense, industrial establishments, warehouses, and communications are of the highest importance. They are therefore natural objectives of coup operations. Perhaps the quickest results are obtained by an enemy through efforts against stocks of finished products, or against industries engaged in the final stages of a manufacturing process. If measures are taken against industries which produce raw materials or partially finished products, such as mines or steel mills, the effects are not generally discernible at once. Later, they might have catastrophic consequences. Electric power plants and transformer stations must be regarded as probable objectives of enemy action. Also, water and gas works and other public installations can certainly be considered. Damage done to installations of this type may produce serious results, not only immediately but also on a long-range basis.

Coup operations may also be aimed directly or indirectly at a nation's population by spreading disease. Owing to developments in bacteriological and parasitic warfare, terrifying results from coup operations of this type are possible. Either bacteriological or radio-active agents may be used directly against human beings. But it would appear that widespread results could be obtained indirectly by contaminating water and food supplies or by destroying harvests and killing cattle.

PREPARING FOR A COUP

Preparations which must be made for a coup naturally vary with respect to their nature and extent. The preparations depend on the goal and on the anticipated difficulties. World War II presented numerous instances of coup operations on a large scale. The type and extent of the preparations vary, but there are certain things that must be done in all cases.

First, a suitable objective must be selected. This choice is not made at random but is generally an integral part of a general plan directly connected with the plan of military operations.

The planning of a coup is based on prior investigations. The study of objectives includes the use of maps, photographs, technical diagrams, and other information found in catalogs, newspapers, periodicals, or reference works. An objective may also be studied on the spot. Investigations of the latter type may be made either by persons sent out especially for the purpose or by contact men.

The chances of obtaining the necessary information will be considerably augmented if contact men can be procured who are connected in some manner with the objective to be investigated.

It will also be highly desirable to procure collaborators or contact men who are well acquainted in the locality where the coup is to be executed, and who will be able to cooperate actively in its execution.

ORGANIZATION REQUIRED

The execution of a coup will ordinarily be carried out by a group of individuals. This group may vary from only a few individuals to a large military force.

The mission may either be assigned to a group of persons in the country planning the operation or entrusted to political sympathizers or other

1852

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

contact men in the country where the coup is to be executed. Naturally, a combination of both of these methods can also be employed.

Where the first method is used, the force will usually be instructed, trained, and equipped in the home country. Later, the force will be secretly or openly transported to the country in question. Where the second method is employed, the instructions for the execution of the coup operation as well as the necessary equipment are, in most cases, supplied by foreign collaborators.

ANTI-COUP DEFENSE

The above considerations automatically lead our thoughts toward certain measures to be taken against coup operations. These measures may be divided into those calculated to render preparations for coup operations difficult or impossible, and those calculated to limit or thwart such operations.

Measures against coup operations are primarily aimed at hindering the planning of such operations. It is of great importance, therefore, that everything published concerning the possible objectives of a coup be so composed that the material cannot directly serve the wrong interests.

Foreign agents are often forced to take costly and dangerous risks in securing information if caution is observed in publishing material relative to new mines, power plants, or other similar installations. This is also true as regards news which, in itself, appears to be of little significance and could not be classified as secret.

It is evident, therefore, that if necessary caution is to be observed, a clear idea will be required concerning what objects in one's own country are or could be actual objectives of a coup. A clear idea of possible objectives is also necessary in order that various measures may be taken to protect them.

Measures taken to hinder the preparation of coups should be the concern of police forces, civil defense agencies, and certain military organizations. In time of peace, police and military missions in this field should be dominant. Civil defense can only assist in educational activities and provide some personnel on a voluntary basis during peacetime. Obviously, planned activities of various types, especially those in which there is cooperation with police, the home guard, or local draftee contingents, are to be included under this head.

The measures which must be taken by these organizations to prevent coup operations, when such operations are first being planned, present entirely different aspects in time of war. Not only the military defense, but also civil defense and the police encounter many difficult situations. For example, fire-fighting units are ordinarily not part of the civil defense organization in peacetime. However, such units play an important part in controlling coup operations. Therefore, they should be a part of the defense forces at all times. The distribution of the defense tasks among the various authorities is a very difficult matter. Generally speaking, where "foreign-political" or military methods are employed, the defense force appears to be the proper one to intervene. If "domestic-political" means are to be employed, police measures will probably be taken in most cases.

Effective anti-coup defense calls

1853

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

for prior organization. First of all, an inventory of the actual targets must be made and kept constantly up to date.

Inasmuch as coup planning and coups may occur at other than war periods, planning for defense against coups also must be conducted in time of peace.

Coordination of anti-coup defense measures must be realistic. The authorities concerned must keep one another well informed on the various tasks to be performed and on the measures which have already been taken. Tactical coordination, possibly by a common commander in areas where action must be taken to thwart a coup, will probably be necessary.

One of the most important actions to be taken is to reduce the time required for organizing anti-coup defense units. The trend appears to be toward using small, well-trained, well-armed units which are capable of quick intervention. Arming the personnel working in vital installations and institutions would seem to offer many advantages.

In anti-coup defense, even more than in general defense, knowledge of the enemy's plans increases the chances of disrupting them. Efficiency of the intelligence service is, therefore, of great importance.

Discontent and unhappiness on the part of the population are of assistance to an adversary in obtaining willing contact men and collaborators to prepare and execute coup operations. In anti-coup defense, therefore, the removal of these contributing causes of disloyalty to the greatest degree possible is important.

CONCLUSION

Anti-coup defense within the framework of national defense is highly important. All of the people of a country may have a part in anti-coup defense measures, even perhaps to a greater degree than in other types of defense.

Military Review Feb 50 Uncl

URC-4

Temporarily designated the URC-4, this new miniature air-sea rescue transmitter-receiver will eventually replace the famous "Gibson Girl."

Developed by AMC, this new set is not much larger than a ration kit. The mercury-type battery is a separate unit with a rubberized cable connection long enough to allow the battery to be slipped in a pocket while the set is in use. The battery will not deteriorate thru lack of use or age.

The set operates on Very High or Ultra High Frequency and can transmit either voice or code over an 80 mile range.

The entire suit is completely impervious to salt water and withstands temperatures from +160 to -50 degrees Fahrenheit.

V. 2 No. 10

The shots above and on the front cover show three stages in the experimental ditching of a B-17 in the Gulf of Mexico.

The Air Proving Ground Command and the Air Materiel Command cooperated in these tests to determine the effect of ditching on airplane structure. A total of seven B-17's were ditched.

The crewless planes were guided to the watery runway by remote control. The sole concern of the "rescue crews" was recovery of the valuable recording instruments and motion picture film which recorded the crash and the damage to the plane at the time of impact.

This information will be used by Air Materiel Command to strengthen future planes against the hazards of ditching.

AIR INTELLIGENCE **Review**

This "Review" is published for three reasons:
1. To provide timely data regarding new techniques, practices and general information whereby intelligence personnel can maintain proficiency.
2. To provide material which will afford all personnel an appreciation of the intelligence role.
3. To provide a medium whereby all intelligence personnel and activities may exchange viewpoints, problems and solutions.

Two types of material are solicited for publication:
1. Stories and pictures relating to the intelligence activities being conducted within an organization.
2. Original articles of a noncontroversial but informative nature.

Material submitted must include sources utilized and the authors name, rank and present military affiliation. Mail stories to: The Editor, "Air Intelligence Review," ConAC, Mitchel Air Force Base, New York.

MILITARY AIR POWER IN EUROPE

This article is a condensation of a series of articles by Ansel E. Talbert, Aviation Editor of the New York Herald Tribune, one of America's leading aviation writers. It is reproduced through the courtesy of Mr. Talbert and the New York Herald Tribune.

A shadow is being cast across the face of Europe today by the wings of Soviet Russia's Red Air Force.

Soviet military aviation now consists of about 15,000 first-line aircraft divided among (1) "Air Armies" attached to the ground forces (2) the interceptor arm of the Soviet air defenses and (3) the independent long-range bomber force now being expanded by special order of Stalin. There are also air units attached to the Soviet Navy.

The Red Air Force is numerically the strongest air force in the world although its offensive and defensive capabilities are in many respects far below those of the combined strength of the United States Air Force and naval aviation. It is more than twice as large as the German Luftwaffe, which had nearly 6,000 first-line planes available on all fronts in the summer of 1940 to implement Nazi dreams of conquest.

New production for the Red Air Force includes a jet interceptor with swept-back wings, probably designed by Artem I. Mikoyan and Mikhail Gurevich, and four-engined bombers resembling the American B-29 Superfortress.

Soviet aviation is backed by an aircraft industry which--according to Stalin--produced 40,000 aircraft of all types, including trainers and liaison planes, in 1944. This, by way of comparison, was the year in which the United States constructed 96,000 airplanes, a large percentage of which were four-engined bombers.

The United States supplied 14,795 aircraft of all types to Soviet Russia during the recent war.

There is general agreement among strategists in Europe that the Red Air Force is a formidable instrument for co-operating with the Red Army in a sweep westward across the Continent. In fact, in its present composition it is an air force organized primarily for supporting ground troops--mechanized cavalry in particular.

MIKOYAN

GUREVICH

THIS PAGE IS UNCLASSIFIED

Most strategists believe that with Allied forces now available in Western Europe--and these forces are being strengthened--the Red Air Force could hardly be bested or kept from gaining air superiority at any point east of the Pyrenees or the English Channel.

An accurate picture of Soviet Air power, however, must bring into focus both strong points and weaknesses. There is evidence of the existence of many of the latter.

The Red Air Force, for example, did little strategic bombing in World War II. As a strategic air force capable of trading blows against industrial targets during the next three years with heavy bomber units of Great Britain and the United States, the Red Air Force is regarded as second or third rate.

This is so--even now that Soviet scientists have accomplished an atomic explosion--unless the British and Americans allow it to become first-rate by default. All signs point to the opposite right now.

Morale of the Red Air Force, except under conditions of combatting invasion of the Soviet Union, is open to question. This is attested by the number of deserters up to the rank of colonel who have been claiming refuge in Western Europe during the past two years.

During World War II sizable aviation detachments of the German-sponsored "Russian Army of Liberation" commanded by Lieutenant General Andrei A. Vlassov, former "Hero of the Soviet Union," were organized at Marienbad and Eger, Czechoslovakia. Recruiting was from among captured Red Air Force pilots. General Vlassov's air chief was Major General Victor Maltzev, former Red Air Force officer. Ground units of this anti-Stalin army performed well on the Eastern Front but surrendered without fighting to the Allies in the West.

It is not generally known in the United States that the Red Air Force high command has been purged again and again by order of Stalin from 1937 through the present post-war period. This is true also of the directorates of top Soviet Aeronautical research centers such as the Zhukovsky Air Engineering Academy in Moscow.

Stalin's policy of using alternately the knout and sugar-candy reward is nowhere more apparent than in the Soviet aircraft industry. A.N. Tupolev, famous designer of bombardment aircraft, and many other outstanding aeronautical engineers have (1) served jail terms for "crimes against the Soviet state" and (2) received high decorations and "Stalin prizes" for achievements.

During the last twelve years the post of chief of the Red Air Force has become almost as unhealthy for its holders as was that of Minister of the Interior under the last Czars of Russia. The latter office frequently became vacant suddenly as the result of direct action by revolutionists; the Red Air Force post is vacated only by order of Stalin and the Politburo but the changes come with the same abruptness.

Starting with General Yakov I. Alksnis, who also held the position of Vice-Commissar of Defense, the following commanders of the Red Air Force have been removed during the years indicated either by firing squads or by sudden demotion to insignificant posts and disgrace:

General Yakov I. Alksnis (1937);

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

General Alexander D. Loktionov (1938); General Pavel Rychagov (1940); General Yakov Smushkevich (1941); and Marshal of the Air Force Alexander A. Novikov (1946).

The careers of General Alksnis and Marshal Novikov shed light on what can happen to high officers in Soviet Russia who make political missteps. General Alksnis was an old-time Bolshevik who became chief of Soviet aviation in 1933. He was obsessed with the idea of making it as progressive and powerful as that of any other nation. In 1934 he visited Great Britain and the Netherlands to observe air progress, and in 1946 he visited Czechoslovakia for the same purpose.

This foreign travel evidently was a serious error. At the start of Stalin's widespread purges of Soviet military men accused of "conspiring with foreign powers" General Alksnis was appointed to the tribunal which condemned to death Marshal Mikhail N. Tukhacheveky. A short time later General Alksnis faced a firing squad himself.

Marshal Novikov came to power in 1941 a few weeks after the German invasion of Soviet Russia. More than 2,500 Russian planes were destroyed on the ground in forward areas by the Luftwaffe during the first few days of the war. General Smushkevich, then Air Force head, disappeared suddenly.

When he took over General Smushkevich's post, Marshal Novikov was thirty-four years old and a major general. Almost immediately he was promoted to lieutenant general and on January 18, 1943, to colonel general. The following month he became the first Soviet Marshal of Aviation and personally conducted Red Air Force operations at Stalingrad.

NOVIKOV

Marshal Novikov became friendly, as did his opposite number in the Red Army, Marshal Georgei Zhukov, with American military and air leaders. Apparently he lost prestige after Stalin and Molotov made a post-war visit to Germany and saw the results of the combined British-American strategic bombing offensive. There may have been no direct connection between this episode and what resulted, but early in 1946 Marshal Novikov was removed from his post without explanation. It is known that he was sentenced to from six to eight years in prison. Only his outstanding war record saved him from the fate of General Alksnis.

RUSSIAN AIRCRAFT INDUSTRY LAGS

Marshal Stalin is credited in official Soviet publications with being an authority in many fields including economics, finance, agriculture, labor relations, painting, music, the drama, philosophy, educa-

THIS PAGE IS DECLASSIFIED IAW EO 13526

tion, literature, history and others.

Some of Stalin's personal contributions to the arts and sciences are open to question but there is no doubt about his direct and personal influence on Soviet air strategy.

Stalin's precocious son, Vassily, who at twenty-nine is a Red Air Force lieutenant general, said publicly that not a single Soviet aircraft type existed "which does not in some manner embody the suggestions and guidance of my father."

Probably no chief of state has intervened so often in Air Force affairs as Stalin, except possibly Adolph Hitler. It was Hitler who personally decided over the arguments of Air Marshal Hermann Goering and other Luftwaffe chiefs that the fast German Me262 fighter was to be used for bombardment.

This turned out to be one of the luckiest decisions of the war--for the Allies. How constructive some of Stalin's equally arbitrary decisions will be, remains to be seen. Until recently nearly 75 per cent of Soviet air strength was assigned to "Air Armies" attached directly to and designed primarily to co-operate with the Red Army commands.

VASSILY STALIN

Such Air Force organization and stress on ground support aircraft can be traced directly to Stalin's personal experiences in the Russian civil war. An official World War II publication of the Soviet government disclosed:

"In the summer of 1936" (Note: Just before Stalin's first purge of the Air Force high command), "Stalin said that in 1920 he had observed the tremendous effect of low-flying attacks by Soviet planes on Baron Wrangel's retreating White Guards. Acting upon Stalin's instructions, Sergei Ilyushin designed the IL-2, a classical type of attack plane popularly known abroad as the Stormovik.

"In analyzing the rout of armored German troops, the historians of the future will not overlook the important part played by the IL-2."

There is no question that the Stormovik was an excellent weapon for knocking out German tanks--particularly after the bulk of Germany's air power was shifted to the Western front. This was done in an unsuccessful attempt to halt the British-American strategic bombing offensive which eventually paralyzed German oil production and communications.

Historians are likely to remember also, however, that Mr. Ilyushin, the Stormovik's designer, told American correspondents in a war-time interview: "We never agreed with

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

the theory that aircraft would play an independent role in the next war ...we believed that the air force would be an arm of the ground forces primarily."

Stalin now has changed his mind, reportedly after viewing the results of strategic bombing in Germany. Marshal Alexander A. Novikov, who put Stalin's ground support theories into practice during most of World War II, has been purged, and General Alexander Golovanov, commander of the Long Range Bomber Force which Stalin has ordered expanded, is now a Red Air Force Marshal.

Mr. Ilyushin apparently can take a hint, for his most recent designing efforts have been concerned with a four-jet bomber patterned after the new United States Air Force Boeing B-47, which recently crossed North America at better than 600 miles an hour.

Serious difficulties have been encountered in putting the new Soviet aviation policy in effect. The aircraft industry of the Soviet Union was the last of any major nation in the world to give up wooden construction of major portions of its first-line aircraft.

Marshal Konstantine A. Vershinin, who succeeded Marshal Novikov as chief of the Red Air Force on March 22, 1946, has been vociferous in calling for increased production efforts from the Soviet aircraft manufacturing industry "to counter the intrigues of international reaction."

In an address on the last Red Air Force Day, Marshal Vershinin, probably inadvertently, pointed a finger at three weaknesses of Soviet aviation. He stated then that the Soviet Union was putting "special efforts" into the development of (1) high speed jet interceptors for defense; (2) multi-engined strategic

EAGER STUDENTS. The Soviets are starting their young, with model clubs for the juniors, regular flight instructions for the older boys and girls.

1866

THIS PAGE IS UNCLASSIFIED

bombardment aircraft, and (3) radar aids for all-weather flying.

There is further evidence that one additional weak point--possibly the most basic and important one--is jet aircraft engines. Paul H. Wilkinson, editor of "Aircraft Engines of the World," and an experienced engineer, is certain that the Soviet Union is several years behind in jet developments as it was previously in piston engines.

At the beginning of World War II all engines used in combat aircraft of the Red Air Force were slightly modified or redesigned versions of America's Wright Cyclone engine, France's Gnome Rhone and Hispano-Suiza engines and Germany's BMW, for which licenses to manufacture had been purchased.

During the early days of the present British Labor government, the Soviet Union was allowed to purchase more than fifty British jet engines of the Rolls-Royce Nene and Derwent type, but this soon was stopped. Soviet designers have the present help of numerous German technicians but it is unlikely that they have solved all problems of mass producing an outstanding jet engine. This still is a kink in the United States aircraft industry which built the world's best piston engines.

In addition to its lack of strategic bombardment background the Red Air Force during World War II had no actual experience in countering strategic attacks with radar-directed interception. Nearly all escaped Soviet pilots have mentioned particularly the lack of electronic aids to all-weather flying available in the Soviet Union and the obvious progress of the United States in this field. Two years ago Soviet transport planes never operated at night, a feat which Americans have been doing for more than a decade, as ordinary routine.

BRITAIN STRESSES AIR DEFENSE

Britain is playing a vital role in European aviation today but for the time being it is chiefly a defensive one.

The nation is expanding and modernizing the British Royal Air Force and the Royal Navy Air Arm with prime emphasis on the defensive capabilities of both. All first-line day-fighter squadrons in the United Kingdom are equipped with Vampire jet-interceptor-fighters of the type holding the world altitude record of 59,000 feet or with Meteor jet fighters having operational speeds of better than 600 miles an hour.

The total personnel of the Royal Air Force at present is about 228,000 as compared with 419,000 in the United States Air Force. There are thirty major aircraft manufacturing companies in Britain together with

MOSQUITO. This old reliable war horse will presently be replaced by twin-jet night fighters.

1867

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

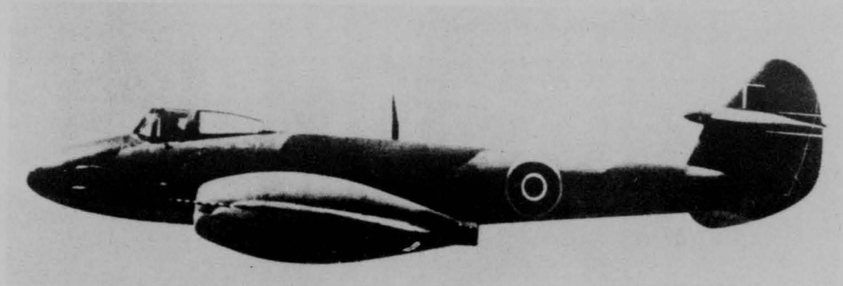
seven additional companies building aircraft engines. Nationalization of the industry is extremely unlikely, a member of the Ministry of Supply told this correspondent.

By June of 1950 the R.A.F. expects to double the present strength of its jet day fighter squadrons in Great Britain. It also plans to equip all night fighter squadrons at present flying Mosquitos--one of the fastest twin-engined piston aircraft of World War II--with twin-jet night fighters.

A new swept-back-wing jet fighter developed from the Vickers attacker is being produced for supersonic interception. Fighter planes of superior armament and speed were the R.A.F.'s chief asset during the Battle of Britain and now, as before, quality of product is stressed.

Britain is selling relatively small quantities of Vampires and Meteors to all the friendly nations of western Europe including Sweden and Switzerland. The nation's air representatives have followed this up with negotiations for producing these types under license in the above countries.

This is bringing about a standard-



METEOR (top) AND VAMPIRE I. British plans call for equipping Western European Nations with these planes either by their own production or by licensing others to produce them.

1868

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

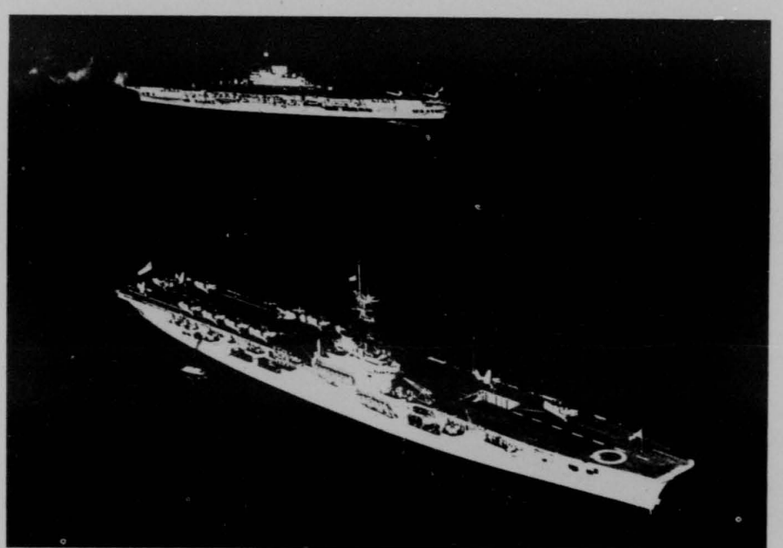
ization of both aircraft types and strategy among European nations faced with the threat of the Red Air Force.

One of Britain's most important air centers at present is the Central Fighter Establishment located in Norfolk County and commanded by Air Commodore D.F.W. Atcherley. Its current "Number One Priority" problem is defense against high speed bombers. This is linked with a study of the likely trends of future air attack against Britain and the nation's allies.

Every R.A.F. pilot now is trained to fly in all types of weather. One cannot get his wings unless he has demonstrated competence as an instrument flyer. All-Empire schools specializing in instrument flight instruction are being created in Great Britain, and pilots from allied nations will be admitted to these and other specialist schools.

Although the British airmen feel that they are unable at present to afford large-scale production of giant bombers of the U.S. Air Force B-36 type, they have just flown their first jet bomber, the English Electric A-1 twin-jet. Also, the nation is known to have larger ones on the drawing boards.



ORTHODOX CARRIERS. H. M. S. Vengeance (foreground) and Implacable. Experiments to eliminate aircraft undercarriage in shipboard operation may revolutionize carrier design.

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

One year from now the R.A.F. expansion program calls for limited production of medium jet bombers. The R.A.F. Bomber Command's chief offensive weapon at present is the four-engined Lincoln, a conventional piston-engined bomber of slower speed than the American B-29 but larger bomb capacity.

Meanwhile, the Royal Navy has been conducting experiments with jet fighters in collaboration with the British Ministry of Supply looking toward the complete elimination of aircraft undercarriage in shipboard operations. This is done through use of catapults and a new secret "flexible flight deck."

Some navy enthusiasts even foresee the disappearance of the orthodox aircraft carrier with its long flight deck in favor of new carriers of the future which would be less vulnerable to bombardment. They look even farther ahead and predict that small teams will be able to set up mobile catapults and mattress-like "flexible flight decks" on land in a fraction of the time now necessary for the building of even small airstrips.

The Vampire was the world's first jet aircraft to land and take off from a carrier at sea. A slightly modified version of the aircraft called the Sea Vampire already is in operational service with the carriers of the Royal Navy.

In spite of the Sea Vampire's superior performance, Royal Navy scientists conducting the landing experiments believe that complete elimination of the aircraft's undercarriage will save approximately one-twentieth of the all-up weight. This gain, they point out, could be translated into improvements in range, ceiling, climb or firepower.

Initial tests were made first with models and gliders to determine hitherto unknown details about landing fast jet fighters having no under-carriage. Later production-type Vampires were used on an experimental "flexible flight deck" constructed at Farnboro and later they were repeated on the flight deck of the Royal Navy carrier H.M.S. Warrior

The carrier Formidable is being reconstructed to take the Royal Navy's most modern jet aircraft including designs still under development. The flight deck and other equipment of the carrier Indomitable have just been surveyed with a view to modernization, for despite the achievements of the R.A.F. in World War II the British discovered that a strong and modern Navy Air Arm was a great asset in modern warfare.

RADAR WALL, JETS, GUN CREWS

The master plan for defense of Western Europe against the Soviet Air Force calls for a radar wall around all of the democratic nations, backed up by jet fighter squadrons and anti-aircraft batteries.

The radar wall will extend more than 1,500 miles from the Baltic Sea across Europe and the Mediterranean Sea to the southern boundaries of French North Africa. It will include Western Germany and as much of the nation as is in democratic hands when the wall becomes operational.

Each of the nations which signed the Atlantic Pact is expected to take part in the scheme eventually, although the initial plans were worked out by Great Britain, the Netherlands, Belgium, Luxemburg, and France. These countries plan to start constructing radar stations on their own territory before the end of 1949.

1870

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

The major part of the electronics equipment under present plans will be manufactured by Britain and France, although some may come from the United States.

Co-operation for air defense measures among the nations of the so-called "Western Union" passed the planning stage last year when on request from the Belgian and Dutch chiefs of staff, the British War Office dispatched two heavy anti-aircraft training teams to Europe. One went to Deventer, about twenty miles northeast of Arnhem in the Netherlands and the other to the Belgian Artillery School at Brasschaat, north of Antwerp, for instructional purposes.

Major General C.W.E. Heath, commanding general of Number One Anti-aircraft Group controlling the air defense of London, went with them. The request, incidentally, went through the Western Union defense committee's advance echelon headquarters at Fontainebleau near Paris.

Nearly all the nations of democratic Western Europe now have chosen the British-designed de Havilland Vampire or the Gloster Meteor as their standard jet-interceptor. Quantity delivery of Gloster fighters and dual-control jet trainers for the Belgian air force is about to start.

France, which is making a considerable effort toward reinstatement as an air power, already has received a small number of Vampires from the British government.

This correspondent learned in France that the nationalized French aircraft company Societe Nationale de Constructions Aeronautiques du Sud Est had just signed an agreement with the British de Havilland Company to manufacture the Vampire under license in France.

One of the most interesting developments in aviation on the European Continent is the return of private enterprise to French aircraft manufacturing. Before World War II the entire industry was nationalized and had a poor production record during the crucial months before the fall of France.

Part of this failure was due directly to the sabotage of production by Communist workers during the period of the Hitler-Stalin pact. At this time official Marxist dialecticians were describing the fight of Britain and France against Nazi Germany as "an imperialist war."

In the current post-war period which saw Communist ministers included in several French Cabinets, numerous Communist party card holders wormed their way into positions of responsibility in the French aircraft industry.

A short time ago, while this correspondent still was in France, the government discharged nearly 300 aircraft industry workmen of the nationalized company S.N.C.A. du Nord. These men, all members of the Communist-directed General Confederation of Labor, appeared at a Paris airfield where a new jet fighter prototype manufactured by their company was being tested and vociferously attacked "manufacture of weapons for the coming imperialist war."

Later the government moved security troops into the company factory at Issy les Moulineaux. The 1,400 workers were advised that because of "obvious and continued sabotage of combat aircraft construction" the factory would be closed until further notice.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

FRENCH CHIEF OF AIR STAFF. General Charles Francois Lecheres, an able career soldier, is the popular boss of the French Air Force.

A bill has passed the French National Assembly which will allow the French government to dispose of such parts of the nationalized aircraft industry as the Minister of National Defense designates. It is understood that the present middle-road French government is anxious to close a large number of the nine nationalized and Communist-dominated aircraft plants in the Paris area.

The industry at present is still between 75 and 80 per cent nationalized, but some of the outstanding new military aircraft prototypes are the products of private factories.

The French "Army of the Air" has a total effective personnel at present amounting to 73,000 men. Jean Moreau, the Air Minister and an old pilot, admitted to this correspondent that this is "insufficient for bringing into being an air force strong and well-organized in accord with the place which France and the French Union will occupy in the world of tomorrow."

Sweden is not a member of the Atlantic pact but the co-operation between Sweden and Great Britain is much closer than is realized in the United States. Considerable numbers of British-built Vampires have been delivered to Sweden during the last two years and an unusual agreement has just been concluded. This will allow Svenska Flygmotor A. B. to build de Havilland Goblin jet engines at Trollhattan, send them to Britain duty free for installation in Vampire fighters which then will be flown to the Swedish Air Force for delivery.

ONLY U.S. CAPABLE OF HEAVY AIR ASSAULT ON RUSSIA

America's air power, in conjunction with the atom bomb, is providing the only real counter-balance in Europe to the strength of the Red Air Force.

Important elements of this air power include Air Force squadrons of very long-range bombers operating from bases on land, and Navy air units of very fast planes attached to carrier task forces capable of roaming almost at will the seven-tenths of the earth's surface which is water.

Britain's fast jet interceptors are beginning to gird Western Europe defensively together with radar and anti-aircraft batteries. It may be that in the unlikely event of war with the Soviet Union during the next three years these jet aircraft will be able to exact ruinous attri-

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

tion from Red Air Force bombardment units.

British Hurricane fighters did that with Air Marshal Goering's "invincible Luftwaffe" in the Battle of Britain and actually halted the attack. But defense alone does not win modern wars. And admittedly only the United States at present can afford to produce in quantity the complex air weapons necessary to exploit by offensive bombardment several clearly defined weaknesses in the economic and military structure of the Soviet Union.

How formidable is the gantlet of Soviet fighter defenses which they would have to run? According to press association cables from Moscow, the Soviet Union demonstrated some jet fighter planes so fast that foreign observers who watched them streak past "could not agree on their characteristics."

This description of dazzling speed would have been more impressive if the detail that the jet fighters flashed across Tushino Air field "at altitudes under 1,000 feet" had not been added. At low altitudes even 100-horsepower light planes look fast, as promoters of midget airplane races in the United States discovered some time ago, and the noise is terrific.

The low-altitude flying act is not exactly a new trick in the repertoire of Soviet propaganda either. Thirteen years ago on May Day, 1936, press dispatches from Moscow reported that an air fleet included squadrons of four-engined bombers "skimmed the spires of the Kremlin" and then at low altitude "roared over the crowd with such speed that few figures on the size of the fleet agreed."

The previous May Day, 1935, according to other cables, a formidable air armada of 700 military aircraft came across the Red Square "flying so low that they seemed in danger of clipping the Czarist double-eagles which still top the Kremlin towers." The cables added: "speed of the aircraft...impressed foreign observers."

During World War II speed was one characteristic for which Soviet combat aircraft were not noted, and although Red Air Force ground-attack aircraft such as the IL-2 Stormovik performed well, Soviet four-engined bombers made only a few sporadic raids throughout the conflict. It would not be well to underestimate Soviet jet fighters, but it also is worth keeping in mind that air shows in the Red Square are not intended to provide data for objective foreign appraisals.

The most obvious weakness of the Soviet Union right now is oil. Air Marshal Goering sourly stated a truism growing out of bitter German experience when he told his Allied captors: "Without oil nobody can fight a war." After American and British strategic bombardment of German oil supply sources, German Panzer units were stranded for lack of fuel. Fighter units could fly only once a week in many cases because they lacked aviation gasoline.

At present the Soviet Union, which produces only one-eighth of the petroleum available to the United States by conservative estimates, is not well supplied with petroleum products for the nation's own economy.

The nations of Western Europe are relatively oil-less. In the event of a Red Army advance toward the English Channel, the Soviet Union

1873

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

would need large additional quantities to operate the area's transportation system and industry. Before World War II, crude petroleum produced in Western Europe amounted to less than 2 per cent of the area's total consumption.

New oil fields are being exploited under intensive pressure from Stalin in Siberia and in the huge square of land between the Volga River and the Ural Mountains northeast of Stalingrad. Considerably more than 50 per cent of all Soviet petroleum still comes from the rich and concentrated oil fields at Baku on the Caspian Sea.

Until recently at least, approximately 80 percent of all Soviet aviation gasoline was refined in the Baku area. This, incidentally, is within easy range of American B-29's and British Lincoln heavy bombers used in the Middle East.

To modify this situation the Soviet Union has been making almost frantic attempts during the last two years to move all existing equipment from the German synthetic oil plants in their zone of occupation to undisclosed areas deep inside Russia. For several years these could produce unaided only a portion of the fuel needs of the huge Red Air Force. Even if sufficient, the benefits of this production would depend on the efficiency of the Soviet transportation system.

Actually the railroads of Soviet Russia are considered by Allied strategists to be highly vulnerable to air attack, even though there are few marshalling yards in the European sense. The Soviet Union, with roughly three times the land area of the United States, has less than one-third the railroad mileage.

Under war conditions the Russian railway system would be under severe strain without any outside interference. Air bombardment would certainly intensify the strain.

Other high priority targets in the Soviet Union after oil centers and communications probably would be (1) electric power stations (2) Soviet aircraft engine factories and (3) centers such as Moscow. (Besides being a ball-bearing and aircraft manufacturing city, Moscow is the location of many top Soviet air research and aeronautical engineering laboratories.)

The United States Air Force is within theoretical reach of some of the most important strategic targets in Soviet Russia through B-29 units operating from Britain and Western Europe, the Middle East, Scandinavia, Okinawa and several other points.

These attacks could be supplemented and possibly supplied with fighter escort from highly-mobile air carrier task forces of the United States Navy. Chiefs of this service have disclosed that the new North American AJ-1 bomber is a plane designed specifically for carrying the atomic bomb.

The United States Air Force is building its future long-range strategy around the huge Convair B-36 with the idea of "conducting if necessary intercontinental warfare from bases inside the United States." Former General Muir S. Fairchild, deputy chief of staff of the Air Force, told this correspondent:

"There is discouraging evidence that the full significance of our widely discussed long-range weapons is seldom completely grasped. Our possession of some such aircraft already has made obsolete the old me-

1874

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

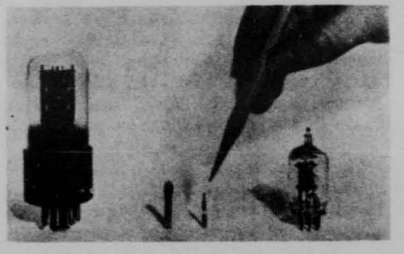
THIS PAGE IS UNCLASSIFIED

thod of defense against air power which involved conquering or absorbing all possible base areas which would be useful for strategic attack. Now that air attack is possible from great distances to the heart of any major power, none can defend itself from such an attack by piece-meal conquest of other nations."

Whether or not the B-36 is as good as the Air Force claims it to be, this correspondent cannot say. It is beyond question, however, that any future war involving the United States would see major emphasis put on the strategic air offensive. The B-36 has been chosen by the Air Force as its basic future weapon until a better one can be built. Its use should enlarge the capacity of the nation to destroy any enemy's will to resist.

Uncl

"TOM THUMB" RADIO TUBE



The new "Tom Thumb" synthetic radio tube, which is about the size of a kitchen match head, will probably go a long way towards reducing the size and weight of airborne electronic equipment.

Developed by Air Materiel Command's Components and Systems Lab, the subminiature tube, called a "fieldistor," is now in its early stage of development.

Being only 1/90 the size of a standard radio tube, the "fieldistor" resembles the end of an eye dropper. Ten of these tiny tubes could be carried in a thimble.

The small size and structure of the "fieldistors" will enable them to better withstand engine vibration, gunfire damage, and landing shock which literally shakes the life out of ordinary tubes. Another big advantage of the new tube is that it uses such a small amount of current that most batteries can be eliminated. For instance, portable radios of the future, equipped with "fieldistors," could be operated with a very small battery. Other civilian items for which the tubes would be useful include radios, television equipment, hearing aids, fire and burglar alarms and thermostats.

AMC warns that the new tubes will not be available for civilian use for some time, since they are still in the development stage. For one thing, the tube is still a bit too noisy. About 250 tubes have been made by hand and the cost is high. However, with mass-production methods, it is believed "fieldistors" could be made at a reasonable cost.

Development of the "fieldistor" is but one of many projects underway in the USAF to reduce the size and weight of various equipment.

HUMAN VALUES & WORLD SECURITY

"We face hard realities in seeking world security and until we can get the 100 percent participation in collective security hoped for in the United Nations, we must seek a collective defense with as broad a base as possible as the essential alternative," Ambassador Warren R. Austin said on December 7.

Speaking before the Rochester Institute on International Affairs in Rochester, New York, Ambassador Austin said that in the United Nations, the free world is demonstrating its unity and warning against dangerous adventure.

The United Nations provides the facilities for harmonizing policies and initiating cooperative efforts to strengthen and stabilize the member nations. Most of all, the United Nations is the indispensable bridge over which the majority and minority must some day meet and agree to cooperate on building an enduring world security. To this end we reject the tricks and propaganda substitutes for strengthening the peace while eagerly seeking with outstretched hand the genuine opportunity for cooperative action.

What the United Nations strives for primarily is world security. Experience is unfolding better methods and increasing faith for its ultimate achievement on a universal basis.

The term "security" has a broad and comprehensive connotation. Always at the heart of it is the idea of protecting human values. So the concept of collective security goes far beyond the exercise of police power with the aim of preventing war. It encompasses collective measures to deal with the causes of conflict, which, in the last analysis, always concern human values.

It is no accident that the statesmen coming from governments in exile and from countries overrun by the aggressors linked respect for human rights with peace and world security.

The Paris Assembly has been called "the Human Rights Session." It not only adopted the declaration, but it also voted unanimously for the convention on genocide—the multilateral treaty outlawing, as an international crime, the destruction of nationalities, races, or religious groups. This convention is now awaiting the required number of signatures to bring it into force.

In the Fourth Assembly, just now concluding its deliberations, security and freedom were again linked in a resolution on the essentials of peace. This was a substitute resolution for a Soviet proposal which accused various unnamed states, and especially the United Kingdom and the United States, of fomenting and planning a new war and called for a five-power pact for strengthening peace. After decisively rejecting this Soviet resolution, which I characterized as an "artificial olive branch surrounded by thorns," the Assembly adopted the substitute on the essentials of peace by a vote of 53 to 5.

The majority resolution rested firmly on the Charter, "the most solemn pact of peace in history," which laid down the "basic principles necessary for an enduring peace."

1876

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

The resolution declared "that disregard of these principles is primarily responsible for the continuance of international tension."

"The General Assembly calls upon every nation," reads the resolution, "to promote, in recognition of the paramount importance of preserving the dignity and worth of the human being, full freedom for the peaceful expression of political opposition, full opportunity for the exercise of religious freedom, and full respect for all the other fundamental rights expressed in the Universal Declaration of Human Rights." The Soviet bloc of five members voted "no" to this paragraph among others. In so doing, they identified one source of the present apprehension in the world.

Through the United Nations we have sought world security and continue to seek it on all fronts. Fundamental freedoms are of crucial importance, because it is through the exercise of freedom that people struggle for all the other social, spiritual, economic, and political values contributed to a secure world. But we have tackled directly the problems of improving standards of living, expanding production and trade, increasing health and education, advancing the welfare of non-self-governing peoples and their attainment of self-government. The activities of the United Nations carried on through the Economic and Social Council, the Trusteeship Council, and the specialized agencies such as the World Health Organization and the Food and Agricultural Organization all contribute to world security. These efforts are designed to create the conditions and opportunities which will provide a favorable climate for peace. Indeed, they are the worlds of peace.

There is no use blinking at the fact that the hoped for unity on the central problem of maintaining peace and security is lacking. Nothing short of that unity can give us the assurances we seek. Nothing short of that unity can relieve us of the anxieties and expenses involved in alternative approaches to world security.

Now it is to the sense of anxiety that the Soviet Union directs its propaganda campaigns and phony peace proposals. The Cominform has just resolved to make new mass appeals and mobilize popular demands for peace. The order has gone out, and the Moscow-directed Communist parties may be expected to stage new rallies in a so-called "peace offensive." We have to be alert to avoid being victimized to some degree by the repetitive propaganda which makes its appeal to the natural fear of war and wish for security.

SOVIET PROPAGANDA LINE

In this General Assembly, we have just given a preview of the propaganda line. It was exhaustively elaborated by the Soviet spokesmen and those from Poland and Czechoslovakia in the long debate on Mr. Vyshinsky's resolution. Yugoslavia alone among the Communist countries pulled off the false face of peace worn by the Cominform and revealed the aggressive features of the true face of Sovietism.

The delegates to the United Nations after 4 years of carefully listening to the speeches of the members of the Soviet bloc have learned a new vocabulary--what Mr. Bevin calls "The up-side-down language." They have learned that a "peoples' democracy is in reality a Kremlin-directed and supported tyranny, that "fascist brigands, imperialists and war-mongers," and any number of similar terms, refers to Yugoslav Communists, European socialists, liber-

1877

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

VISHINSKY

BEVIN

al democrats, in short, to everyone who disagrees with the aims of the Kremlin. The world "peace" means nonresistance in the path of Soviet expansion.

As the delegates listened to the violent arguments of the Soviet spokesmen in this debate, the feeling was widespread that they were not calculated to convince us, not even directed at us. Rather, it seemed to many of us that the words were uttered from the rostrum of the United Nations as a convenient method of providing a handbook for speakers at mass meetings in a subsequent campaign to sow dissension and confusion. The simple record of the vote shows that not one single delegation responded to the Soviet appeals. Every one of the delegations except Yugoslavia, which abstained, the three Soviet states, Poland, and Czechoslovakia affirmatively supported the alternative resolution on the essentials of peace.

This whole propaganda maneuver and the debate it set off concerns the vital question of world security. It is worth analyzing.

This was not a U.S. vs. U.S.S.R. dissension. It was not a so-called "East-West" debate. It was the Soviet states, Poland, and Czechoslovakia against the rest of the world with no exceptions.

What could be the purpose of such a performance? First, I think its purpose is to tighten controls and justify police measures against dissenters at home. Their people are given only their side of the story—what they said, not what the rest of the world said. The object here is to convince their own people that they are completely encircled by enemies who are planning an attack from all sides and thus to drive workers to greater efforts for production while foregoing the fruits of their labors and at the same time to justify purges and liquidations of grumblers or dissenters or traitors. The prior suppression of fundamental freedoms makes this possible. Regardless of what the outside world may try to do or say, it can't get through to the Russian people.

A second purpose, in my judgment,

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

is to provide a propaganda line for the fifth columns in other countries in hope that to some degree public opinion, which controls the governments instead of being controlled, may be confused and divided. This line plays on very strong fears as well as powerful wishes.The speeches produced as patterns by Mr. Vyshinsky and his colleagues are full of wild assertions, appeals to idealism and bitter condemnations documented by piles of quotations ripped out of context, distortions, and shocking fabrications.

At what did their resolution and their speeches strike? On this question the delegates at the United Nations had no illusions. The target was our growing plans for collective security.

In this debate the attack was leveled at the pact of Rio by which the nations of this hemisphere plan their common defense, the aid to Greece and Turkey program which helps hold the line against Soviet expansion at that point, and most of all the Atlantic pact and mutual defense program by which the United States and Western Europe present a united front. The European Recovery Program was also attacked because it is expanding production, increasing stability, and averting the kind of chaotic conditions which invite minority dictatorships to power.

Having blocked agreement in the Security Council on world security, they seek to weaken the collective security measures we are taking as the essential alternative.

The next question is,why did every other nation join in rejecting their proposal?

They rejected the propaganda claim, on which the whole resolution was based, that a war is being prepared against the Soviet Union.

They rejected the attempt to characterize as preparations for aggression the building of necessary defenses.

They rejected the tricky paragraph on the prohibition of atomic weapons as another in a long line of attempts to circumvent the United Nations plan to outlaw such weapons by an effective system of control and safeguards against the hazards of violations and evasions.

They rejected the proposal for a new pact among the five powers to strengthen the peace as fatuous insincerity in the light of the Soviet record of obstruction and noncooperation in the United Nations, and violations and repudiations of existing treaties and pacts.

In the debate and the substitute resolution on the essentials of peace,they displayed the reasons for their unity in resisting Soviet threats to world security. The Soviet states, Czechoslovakia, and Poland substantiated and underscored the claims of all the others by violently opposing and voting against a resolution which simply asked all members to act in accordance with the principles of the Charter in the spirit of cooperation.

SOVIET DESIGN AND TACTICS

At the center of the problem of world security is the well-known aim of the Soviet regime to disrupt and overthrow governments from within through support of the conspiratorial forces of Communist parties and to insure subservience to Kremlin dictates.

Thus, we are not confronted by a state regime that is interested in getting along with other independent countries but one that persists in

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

designs to dominate them. These designs, documented by Soviet theoreticians, by the extensive training program for conspiratorial leaders, and by along record of confirming acts, are understood by the members of the United Nations. Their hopes that the common war effort might lead to peaceful cooperation and the abandonment of the will to dominate were dashed by events.

IRAN

Contrary to their pledges, the Soviet army remained in Iran attempting to force that little country to accept Soviet dictation, withdrawing finally only under world-wide pressure brought to focus in the Security Council. The Soviet forces left behind an organized and armed minority which they apparently hoped would be able to control the territory they evacuated and flout the authority of the government.

FAR EAST

In the Far East they dismantled Manchuria, forced the partition of Korea, refusing subsequently to cooperate with the United Nations Korean Commission, and turned over the confiscated Japanese arms to the Chinese Communists to carry on a civil war.

TURKEY

Turkey was subjected to threats and pressure, thus creating the necessity of aid and support and the beginning of the movement for collective defense.

GREECE

Likewise, war-ravaged Greece was violently attacked by the Communist forces from within, supported the world-wide propaganda machine of the Soviet Union and by the practical assistance of the northern neighbors, already dominated by Soviet force. Again, Soviet voices called for peace. Yes, peace by the submission of the majority to the force of the minority. But at no point would these so-called peace makers cooperate with the overwhelming majority of nations through established United Nations Commissions.

BALKANS

The pledges of free elections for Bulgaria, Rumania, and Hungary made by Premier Stalin himself in agreement with President Roosevelt and Prime Minister Churchill were cynically disregarded and circumvented. The story of Hungary presents the general pattern by which the minority overwhelms the majority. It is put succinctly in a speech of Jozsef Revai, one of Hungary's leading Communists, published in the March-April 1949 issue of "Tarsadalomi Szemel" (Sociological Review).

Mr. Revai remarks, "We were a minority in the Parliament, and in the government, but at the same time we represented the leading force. We had decisive control over the police forces. Our force, the force of the Party and the Party and the working class, was multiplied by the fact that the Soviet Union and the Soviet Army were always there to support us with their assistance." This admission was apparently too blunt, so the periodical in which the speech appeared was recalled.

PEACE TREATIES

The efforts in this Assembly of the United Nations to obtain compliance with the peace treaties guaranteeing human rights to Hungary, Bulgaria and Rumania, were met with denunciation and repudiation of Soviet obliga-

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

tions.

CZECHOSLOVAKIA

The tragic story of Soviet domination of one of Europe's proudest little democracies, Czechoslovakia, is well known. This crude maneuver, by which the Communist minority seized control, threatening civil war with Red Army assistance on the minority, shocked the world. More than any other incident in the long series of moves for Soviet expansion, the seizure of Czechoslovakia alerted the free world to the necessity for a strong and collective defense.

YUGOSLAVIA

The case of Yugoslavia strips away the last pretense of respect for small states, even when they are governed by Communists and formerly recognized as so-called "peoples' democracies." Refusal to follow the dictates of the Kremlin to the letter subjects even such a Communist government to threats and pressures--troop movements on its borders, incidents, and repudiation of treaties.

POLAND

In Poland where again the minority with the support of the Red Army succeeded in eliminating and destroying the majority parties, the domination is made decisive by installing a marshal of the Red Army as Minister of Defense.

INDONESIA

Soviet policy of rule or ruin was never more vividly applied than against Indonesia in the midst of its struggle for freedom and independence. Its Communist Party first tried to undermine and overthrow the Republic in an armed revolt. President Sukarno and Premier Hatta who

HATTA

put down that revolt were then attacked as quislings and traitors. The efforts of the United Nations to achieve a peaceful settlement between Indonesia and the Netherlands were sabotaged.

But in spite of, and partly because of, this blatant behavior to obstruct peace, the United Nations Commission for Indonesia paved the way for a free and independent United States of Indonesia, resting on what Premier Hatta called five basic principles: "devotion to God, Humanity, Nationalism, Democracy, and Social Justice."

In the closing days of this General Assembly, Soviet opposition to peace in this area was bitterly pressed. As the Indonesians and the Dutch approached the final peaceful settlement--the birth of a nation and the foundation of a Union--the Soviets made frantic efforts to prevent settlement and discredit both parties to the accord.

Members of the United Nations have studied these events in detail. They are not easily hoodwinked by

1881

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

protestations of peaceful intentions. They remember the tense case of the Berlin blockade as it was debated in Paris and the Soviet veto which turned down the conciliatory proposal. They also know that firmness and patience backed up by the airlift overrode that veto.

Many of them have experienced the Cominform tactics to disrupt recovery in their countries and to prevent their organization of national defense in cooperation with others.

In the light of such a record, one can imagine that the Soviet resolution added insult to injury when it sought to condemn the measures for collective security reluctantly taken in response to their own provocative actions as preparations for a new war. They block the path to peace settlements, to unanimous agreement on practically every situation to come before the Security Council, to agreement on the control of atomic energy and the reduction and control of armaments, to agreement on the establishment of peace forces as contemplated by the Charter. Then they accuse those who cooperate to get as much collective security as they can in spite of this obstruction of plotting war against them.

You may be certain of one thing: this unreasonable and violent assault upon almost all members of the United Nations has welded them into a unity. That unity is producing collective defense. That collective defense is the solid foundation of world security.

But it is not what we want. It is what under the circumstances we are forced to take as the unfortunate alternative to comprehensive collective security encompassed in the Charter. World security depends upon stopping further encroachments upon the free world. It rests upon the capacity of the many to stand together so overwhelmingly that aggression is obviously foolhardy.

In the United Nations, this unity is built up and expressed. The specific threats to the peace come under public debate and the collective power of the many can be brought to bear as a deterrent against dangerous adventures. Even in spite of the veto, the majority have succeeded—as in Indonesia—and will continue to succeed in working for peaceful settlements of disputes, isolating and conciliating conflicts and exposing peace—disturbing acts or situations to the light of world opinion.

This opinion is the essence because it determines in any given situation whether the collective defense is really united and prepared to resist encroachments. And because of this fact, the Soviet propaganda campaigns are devised to split and confuse public opinion.

The propagandists know very well that peace-loving people hate to maintain world security at such a price and by such collective force. But the only road open to the eventual cooperation of all in the maintenance of peace is the determined demonstration that the aims of those who seek world control cannot be achieved.

We should realize that the people in the countries of the obstructive minority pay a much bigger price for the aggressive policies of their leaders than the people of the rest of the world who are thereby forced to organize an expensive collective defense. The price of noncooperation and the will to dominate on the

YF-96A, JET FIGHTER

The YF-96A, new swept-back version of the F-84 Thunderjet, has completed taxi tests. The plane has been dismantled and flown to Edwards AFB where it will be flight tested.

The jet fighter, built by the Republic Aviation Corporation at Farmingdale, L. I., has swept-back wings of the type preferred by designers for supersonic flight and will be designated the YF-96. Features of the aircraft resemble parts of both the Republic F-91 jet-and-rocket powered fighter and the Republic F-84-E, which during the last few days had its combat radius extended to beyond 1,000 miles for bomber escort and enemy territory penetration work.

The YF-96's "design performance" figures greatly exceed those of the F-84-E.

The Republic staff saved considerable time from the customary period required for producing a fighter by adopting the basic fuselage design of the F-84-E and working from there. Five months is understood to be the total time required for building the prototype.

Unlike the wings of the F-91 jet-and-rocket plane, which were extremely thin and were wider at the tips than at the junction of the wing and fuselage, the wings of the new YF-96 have a distinct taper and are so designed as to permit fuel to be carried internally.

The new jet plane probably will be used for high altitude interception up to 40,000 feet, with very high altitude duty reserved for aircraft equipped with additional rocket engines. The YF-96 is powered by the latest version of the Allison J-35 turbo-jet engine and also may have tactical use in fast ground-attack missions.

Turbo-jet engines perform best at around 35,000 feet and above that level lose thrust as the altitude increases because of the atmosphere's lack of oxygen. Rocket motors, however, take no oxygen from the atmosphere and can perform well at any altitude.

The wing span of the new jet fighter is thirty-four feet and it has an over-all length of thirty eight feet. Its cockpit will be pressurized and air-conditioned.

POLAR GUIDE

This is the twelfth of a series of articles on Arctic Indoctrination

Chapter 18--Land Survival (continued)

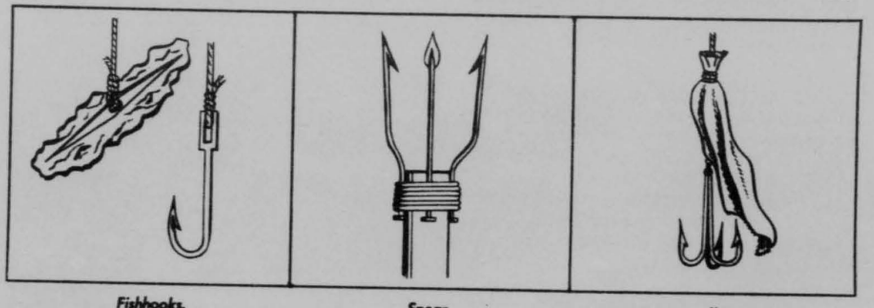
FISHING FOR FOOD

All northern fish are edible--even the ugly spiny-headed sculpin of the tidal pools. And all salt-water fish except the shark may be eaten raw--straight from the water. Raw shark meat is poisonous. Before you eat it, broil it several times or dry it. Fresh-water fish may contain parasites that might make you sick. Cook the fish if possible--cooking kills the parasites.

There are innumerable streams, lakes, and ponds in the polar regions; but many shallow tundra lakes have no fish of any sort in them. The only fish in some fair-sized streams are tiny minnow-like sticklebacks; and shallow rivers that teem with salmon at the spawning season may suddenly have no fish at all. On the other hand, coffee-colored muskeg streams are inhabited by fine trout that take bait eagerly if they see it. The deeper parts of small streams are sometimes full of fish, and all tidal pools are worth investigating.

The hook and line are not your only means of catching fish. You can catch them with the same type of snare as for a hare. They can also be speared, shot, caught with improvised nets, or stunned with sticks and stones. In fact, in shallow water, you can even catch them with your hands.

IMPROVISED HOOKS. Lacking a real fishhook, you can make one from a nail, canned fish key, or piece of stiff wire. A soldier at Dutch Harbor caught a 20-pound halibut with a bent finishing nail and a small chunk of meat, and many an Eskimo boy has caught flounders, sand dabs, and sculpins with bent pins baited with pieces of lemming or chunks of embryo from a duck's egg. Another effective device is a fishing needle of wood or bone sunk in bait. The



Fishhooks. Spear. Jig.

1886

THIS PAGE IS UNCLASSIFIED

Automatic Fisherman.

needle is swallowed whole, and a pull on the line swings it crosswise, causing it to catch in the fish's stomach or gullet. The needle can also be used to catch sea gulls.

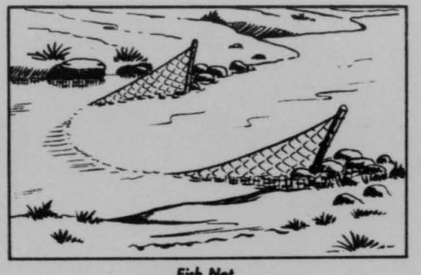
BAIT. Don't expect to find grasshoppers in the polar region--they don't live that far north. Use any insect, piece of meat, minnow or other bait you happen to come across. Some northern fish will nibble at any small object that falls into the waters. Others, at certain seasons, pay no attention to the most tempting bait. Cod swim up to investigate strips of cloth or bits of metal or bone and can be "jigged" before they know what's happening. With a simple jigging apparatus or baited hook, salmon trout can be caught in winter through a hole in the ice of a deep lake.

JIGGING. Jigging gear consists of a hook or a cluster of hooks attached below a "spoon" of shiny metal, a bit of bone, or a small weighted strip of cloth. Let the jig down into deep water, jerk it upward at arm's length, let it sink back, jerk it up again; repeat the procedure until a fish is snagged on one of the hooks. You can catch cod this way in water from a few feet up to more than a hundred feet deep. Be sure the hooks are weighted sufficiently to carry the lure rapidly downward so that it suggests something alive.

NETS. You can make a good net out of stout twine or from the inner strands of parachute shroud lines. For the full-grown salmon trout of tundra streams the meshes should be about two inches square. For such small fish as capelin and smelts, that travel in schools, you will want a scoop net with quite a fine mesh. Make one out of a pliable willow branch and netting or twine.

To make a net for stretching across a narrow channel approximately four feet wide and one foot deep, you need about twenty-six lengths of twine or parachute cord--each five feet long. Tie these in groups of two, at two-inch intervals, to any stake or metal bar two to three feet long. Keeping the rows of knots even, you begin tying the meshes, using simple overhand knots rather than square knots or grannies, and tie the loose ends to another stake or metal bar of the same length. When in place, such a net sticks out of the water a bit at either side of the channel, but the pull of the current drags the top of the net down to the surface.

NARROWING A STREAM. To catch fish,



Fish Net.

1887

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

a shallow stream may be narrowed by building a fence of stones, stakes, or brush, out from either bank, leaving only a narrow channel through which the fish can swim. Stretch a net across this channel; be sure to secure it firmly with stakes or boulders, or you'll lose both net and fish. If you have no net, you can stand ready to hit, shoot, or spear the fish as they swim past. But keep very still while you wait. Fish dart away at the first sign of danger.

DIVERTING A STREAM. If you know a small stream has fish in it, try diverting its channel so as to strand the fish in pools along the old channel. This method is sometimes surprisingly successful.

TIDAL FLAT FISH TRAP. To strand fish when the tide goes out, pile up a crescent of boulders on the tidal flat. Scooping out the area inside the crescent isn't essential but increases effectiveness of the trap.

SPEARS. A good "fish-catcher" can be made from a stout stick of about the diameter of a broom handle, with lengths of stiff wire firmly bound to and projecting from the end in such a way as to hold a fish on the bottom when it is struck from directly above. The tips of the wires need not be sharpened or barbed. If you have a drilling tool, bore holes for the wires.

A spear can be made out of a bar from an airplane tie-down kit or from any piece of metal tubing strong enough to hold its shape in spite of the buffeting it will get. If a file is available, sharpen or barb the tip. An effective trident spear also can be improvised from materials at hand.

DOGGLING. Fish like to hide in sheltered places under rocks or along the banks, and here you can

Improvised Plankton Net.

catch them with your hands. You'll have to be quick; but when you have no fishing gear and they are your only chance for a meal, keep after them. If you don't find crannies where fish are hiding, try making some for them.

SHOOTING FISH. Don't try to shoot fish that are more than a few inches below the surface, and if you shoot from the side, aim below the fish to allow for refraction of light rays. Even with a high-powered rifle you'll be wasting ammunition if you shoot at fish two or three feet under water.

FISH IN TIDAL POOLS. Tidal pools with masses of seaweed in them may seem at first to contain no fish, Poke around. You may find large numbers of small fish hiding among the seaweed near the surface and a few big ones deeper down. For the small fish you need a scoop net. For the big ones deeper down, use a sharpened pole or spear.

PLANKTON. In polar waters, one of the best sources of food is plankton. a conglomerate of minute sea animals, fishes, and plants which abound in polar waters. Whales and other Arctic animals, including birds, depend to a great extent on plankton for food, and laboratory tests have shown that it is high in nutritive value.

You can readily gather up plankton by dragging a conical net through the water. If you don't have a

1888

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

Mussel. Clam. Scallop. Limpet. Abalone.

plankton net, you can improvise one from the upper part of a parachute canopy. Cut out the top to form a cone about three feet long. Tie the vent shut with a string and make a ring about 2 1/2 or 3 feet in diameter to hold the mouth open. Then tie a bridle to it and drag it through the water. Be patient. It will take quite a bit of dragging to secure a substantial amount of plankton.

The best way to prepare plankton is to boil it and make a soup of it. But you can also eat it raw. The only disadvantage will be that, when raw, the tiny shells will stick in your teeth.

FOOD FROM THE TIDAL FLATS

The ocean shores of southern Alaska and the Aleutian Islands are rich hunting grounds for clams, mussels, scallops, snails, limpets, chitons, sea urchins, and sea cucumbers--all edible. These sea foods aren't found throughout the whole polar regions, but where there are stretches of open water along the shore you are sure to find some of them at any season. Most of the makings for an emergency shore dinner can be gathered easily at low tide--and eaten raw on the spot. You can pick up a meal with your hands, dig it out of the mud with a stick, or pry it from the rocks with your pocket knife.

MUSSELS. All polar mussels are edible. However, avoid any that don't shut up tight when you touch them; they are sick or dead and are unfit for food. And beware of the black mussel about two inches long that is attached to rocks by tough threads. Along the north Pacific coast this type of mussel sometimes becomes deadly poisonous in summer (May to September). Cooking does not destroy the poison. On the other hand, this mussel can be eaten safely along the coasts of Labrador, Hudson Bay, and Greenland.

CLAMS. Occasionally clams are found lying on the sand or mud, but as a rule you have to dig for them. At low tide they reveal their presence by spouting jets of water a foot or so into the air. By digging quickly where a jet shoots up, you will find the clam a few inches below the surface. You can dig with your hands, but it saves wear and tear to use a stick or empty clam shell. Clams clear their systems of sand if left in salt water a few hours, but they can be eaten raw as soon as they are dug up.

Some Alaskan clams are quite large; certain varieties are as big as your fist; one type weighs up to ten pounds. While some clams are tough, all are edible and many kinds are available.

The same poisonous organism that sometimes affects the black mussel on the north Pacific coast may also affect clams in this area from May to September. The poison can be avoided by eating only the lighter

1889

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Triton. Periwinkle. Chiton. Sea Urchin. Sea Cucumber.

parts of clams; don't eat the black liver mass.

SCALLOPS. One of the best-eating of the mollusks is the scallop. It has a fan-shaped shell and swims free. Generally it stays offshore in deeper water, but sometimes it may be found close to shore.

LIMPETS. The limpet clings to rocks like an adhesive pad. It is about as big as a half-dollar and is covered with a single cone-shaped or cap-shaped shell. All limpets are edible, but they are rather tough, and gathering enough of them for a meal requires a lot of work.

ABALONES. The abalone of northern waters never grows as large as the famous California abalone, but it has a fine flavor and is prized as food. It has a single, rather flat shell, three to four inches wide, and clings to the rocks so tightly that it must be pried loose.

TRITONS. The best-known of the northern tritons is the hairy triton. The shell of this snail is covered with a growth that gives it a plush-like appearance. Hairy tritons may be eaten raw, but the Indians prefer to cook them. They are tough and when cooked have a strong, slightly disagreeable odor.

PERIWINKLES. These abundant tiny snails of northern waters are only about an inch long, so it takes a lot of them to make a meal. Put the shells in boiling water for a couple of minutes, and you'll be able to extract the meat easily.

CHITONS. Chitons are moccasin-shaped and cling to rocks tightly. When pried loose they roll up, with their hard plates protecting their soft insides. They are pretty tough but can be eaten raw. The edible portions have to be cut loose from the shell with a knife. The most palatable chitons are three to four inches long and have eight bony plates plainly visible on the back. Larger ones, with the back plates hidden under the skin, are much tougher and are not very good to eat.

SEA URCHINS. Sea urchins are spine-covered balls several inches in diameter. They are abundant on Aleutian and south Alaskan shores, in Greenland, and in other polar waters as far north as there is land. Eat only the orange or pink egg masses. To get at the insides, poke a stick through the mouth, which is the opening on the underside. The animals are really nourishing; more than one castaway Indian or Aleut has lived a whole season on virtually nothing else.

SEA CUCUMBERS. These queer-looking animals have the shape of cucumbers but are a far cry from the vegetable variety. They may be eaten raw but are much better cooked. Scrape off their slimy outer skin, cut them up, and boil or steam them.

Hungary,

A STUDY IN SATELLITE SUBSERVIENCE

THE MASTER AND THE SLAVE

The servility of the present Hungarian Government to the USSR and the "unequal relation of subjugation" imposed by Moscow upon Budapest are characteristic of the relationship between the satellite and the Soviet master now existing throughout the orbit. The preamble of the new Hungarian Constitution, promulgated on August 20, 1949, contains three toadying references to the USSR: (a) Gratitude is expressed to "the armed forces of the great Soviet Union" for having liberated Hungary; (b) recognition is given to "the generous assistance of the Soviet Union" in the reconstruction of the war-ravaged country; and (c) even the praise bestowed upon the Hungarian people for their work in laying down "the foundations of socialism" is moderated by the statement that in this work they are "supported by the Soviet Union."

The new Hungarian national coat-of-arms, a star over a crossed hammer and a sheaf of wheat, is a direct borrowing from Soviet heraldry and hardly distinguishable from the emblems of the 16 constituent Republics of the USSR. Adulation for the USSR expressed in public places is apparently unlimited in Hungary today. In June 1948 General Gyorgy Palffy (since then liquidated as a "Titoist spy") declared in a public address that "the Communist soldiers of Hungary must serve the interests of the country with loyalty to Stalin and the Soviet Union." In August 1949 the Minister of Education told a conference of high school teachers that "we teachers must prove our love and loyalty toward the Soviet Union by teaching the Russian language." In September 1949 a reference by Vice Premier Matyas Rakosi to "our great instructor Stalin," in a speech before Communist activists, brought a burst of applause and chanting of "long live Stalin."

INSIDE HELP

In the field of foreign policy, the present Hungarian Government is outdoing its wartime predecessor in serving the interests of a foreign overlord. Through the subservience of its leaders, Hungary has become a forward bastion in the current Cominform war of nerves against Yugoslavia. One of the purposes of the recent Rajk trial staged in Budapest was to provide "moral" justification for an intensification of the Cominform campaign against the Titoist heretics. On September 24, 1949, in Paris, the Hungarian delegates stalked out of the UNESCO general conference when that agency decided to extend its activities in Germany; on October 3, 1949 the Hungarian Government issued an unsolicited declaration, coming as faint reverberation of Soviet thunder, protesting against "the establishment of a separate government in Germany which endangers the interests of peace and democracy."

The zeal with which the Soviet puppets in Budapest are turning Hungary into an economic colony of the USSR knows no bounds. Since signing of the agreement for economic collaboration with the USSR on August 27, 1945 (now reinforced by Hungary's membership in the Council of Mutual Economic Assistance, CEMA), the

1891

THIS PAGE IS UNCLASSIFIED

BUDAPEST. The lovely and once gay capital is now the site of Joint Soviet-Hungarian companies--with profit only to the Soviet partner.

country has been a happy hunting ground for Soviet economic imperialism. So-called Joint Soviet-Hungarian companies, which yield profit only to the Soviet partner, enjoy preferential rights and treatment; the extraterritorial Soviet bank in Hungary is not subject to Hungarian banking regulations. Hungary has undertaken—in addition to its staggering reparations obligations—to pay the USSR $45 million as a redemption of allegedly German assets. Thus, the regime simultaneously abolishes private enterprise with loud protestations of adherence to socialist principles, and reserves a special sector for unbridled exploitation by the USSR.

GOVERNMENT BY A RUTHLESS MINORITY

The complete servility of the present Hungarian regime to the USSR has been made possible by the gradual amassing of all political, administrative, and police powers in the hands of the Moscow-directed Hungarian Communist minority. The Hungarian Communist Party (euphemistically renamed Hungarian Workers' Party since its merger with the Social Democratic Party in 1948), representing only a small minority of the population (5-10%), exercises complete control in Hungary. It has established itself in this position of authority against the will of the Hungarian people, but with the support and intervention of the Soviet occupation authorities, by seizing one by one the instruments of governmental power. As a result the Hungarian people have now been deprived not only of their rights and freedoms as individuals but also of their independence as a nation. The Party is wholly a tool of Moscow. The recent purge of peripheral and deviationist elements, culminating in the liquidation of Laszlo Rajk, former Minister of the Interior and of Foreign Affairs, will undoubtedly result in an even more rigid policy of following unswervingly the policies laid down by the Kremlin.

THE "PEOPLE'S FRONT" A CAMOUFLAGE

In addition to the Hungarian Workers' Party, there are four other parties in Hungary today. These five parties, in close association with certain major front organizations, constitute the Hungarian People's Independence Front. This Front is Communist-led and controlled and serves as a camouflage for the one-party dictatorship. The supremacy of the Hungarian Workers' Party over the Front is guaranteed by the fact that, as a result of previous purges and other repressive measures, the leadership of the other four parties now consists exclusively of collaborationists, crypto-Communists, and Communist puppets. Anti-Communist parties have completely disappeared, the last two remaining such groups being liquidated earlier this year.

The major front organizations are Communist-led and controlled and are

1892

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

used for the purpose of extending Communist domination into every sector of the national life. Organized political opposition no longer exists. Parliament consists solely of Front deputies, all elected under Communist sponsorship on a single slate. However, the overshelming majority of the population is in opposition to the present regime and kept in line only through the terror of the police state.

The entire administrative apparatus is in the hands of the Hungarian Workers' Party. Successive purges of the civil service, the army, the professions, the churches, and the educational institutions have removed all dissenting elements from positions of authority or influence. A new bureaucracy is being built from Communists and fellow travelers. The training of this new bureaucracy is one of the jealously guarded prerogatives of the Hungarian Workers' Party.

YOUTH GROUPS PENETRATED

Communist ideological penetration in Hungary has been most successful among the youth of the nation--the lower the age group, the greater the devotion to the tenets of Communism. For example, probably the most ardent supporters of the present regime are members of the Pioneer Organization, a youth movement for boys and girls between the ages of 6 and 12, who, like the Hitler Jugend in Germany, are supplied with smart uniforms, recreation facilities, games (including a children's railroad), and receive pre-military training. The Pioneers, as well as all other youth organizations, are members of a national youth association, affiliated with the leftist World Federation of Democratic Youth (WFDY). The national youth organization, which is securely under Communist control, is called the Popular Federation of Hungarian Youth. The extent of the Communist hold over Hungarian youth is illustrated by the fact that the Grand Council of this Federation includes delegates from many different youth groups. Since their coordination with the Federation, these groups have become strict adherents of the sinuous Communist Party line. The World Youth Festival, held in Budapest during August 1949, ended on the following note: "Our overflowing affection and sympathy goes out not only to the people who in 1917 opened a new era in the history of human freedom, but our gratitude is thereby expressed also toward those who five years ago liberated us by shedding their own blood...The freer and happier the Hungarian people are, the more they realize the significance of their liberation and the more they try to express their heartfelt gratitude to the liberating USSR, its youth, and its wise leader, the great Stalin."

TRANSFORMATION INTO A POLICE STATE

In order to maintain itself in power against the popular will, the Hungarian Government transformed the country into a police state. Rights of life and liberty of person are now constantly violated by arbitrary arrest and detention, and an atmosphere of fear permeates the entire country. The Hungarian Workers' Party has freely admitted that the Sovietizing of Hungary could not have proceeded without police terror. In August 1948 the main Communist daily newspaper Szabad Nep declared that it is "the magnificent work of the political police which makes it possible for the working class to concentrate its main strength and main attention upon the building of socialism." More recently, Jozsef Revai, the chief Communist theoretician in Hungary, baldly admitted that the present regime had been able to assume complete power only

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

because the Party had "decisive control over the police forces...The force of the Party and the working class was multiplied by the fact that the Soviet Union and the Soviet Army were always there to support us with their assistance." The Soviet Army continues to occupy Hungary pending the conclusion of the Austrian peace treaty; uniformed Hungarian police strength during 1948 was 33,265, about twice the size of the national army. The 1949 budget provides funds for 31,525 state police and 5,010 political and security police—a grand total of 36,535 policemen.

COMMUNIST CONTROL AFFECTS ALL GROUPS

People engaged in urban occupations, as distinguished from agriculture, form about 45 percent of Hungary's population. The control of the regime over this segment became complete with the Communist seizure of the trade-unions, the professional associations, and the government bureaucracy, and with the now almost total nationalization of industry and commerce. (Only small retail trade has not been nationalized.) As a result of expulsions from the un-

TO BE "REFORMED," Hungarian farm women are sorting capsicum pods (red peppers for paprika). Anyone owning over 25 acres today is a "capitalist" and must be dispossessed.

1894

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

ions, professional associations, government employment and the loss of business ownership, the non-proletarian urban classes are now in the process of being reduced to a proletarian status.

AGRICULTURAL "REFORM" DISPOSSESSES MANY FARMERS

Approximately 55 percent of Hungary's population is engaged in agriculture. Before the war, the Hungarian system of land ownership and land distribution was one of the most archaic in Europe. Immediately after the cessation of hostilities in Eastern Hungary, the Provisional National Assembly, then sitting, initiated and executed a sweeping land reform, as a result of which approximately 650,000 landless peasant families were allotted tillable land, averaging 5 to 7 acres per family. The smallness of these plots was probably due to Communist intentions to demonstrate the unfeasibility of individual farming, thus to facilitate the introduction of agricultural collectivism.

The drive toward collectivization has been in full swing for over a year. It is carried out through cooperatives, tractor and machine stations, and compulsory surrender of produce. Peasants owning more than 25 acres of land have been declared kulaks or rural capitalists, who must be dispossessed and liquidated before the countryside can be socialized. According to a current slogan "every kulak is guilty of something;" in other words, punitive measures against all owners of viable peasant farms are justified and permitted by the regime.

LABOR AT THE MERCY OF COMMUNIST MINORITY

Standards of living in Hungary today appear to be higher than in most other satellite countries. Reconstruction has proceeded at a faster pace and food supplies appear to be more plentiful. The morale of the population is, nevertheless, low, among other reasons because of the extremely high prices and because—particularly among industrial workers—of the constantly increasing work norms. These norms represent the units of production necessary to be paid full wages. During 1948, on the whole, norms were based on the productivity of the average worker. Since January 1949, however, they have been based on the production standards set by the so-called champion workers, which tax the ability of the rank and file of labor. The result is a 35 to 40 percent reduction in basic wages. In consequence, not even the proletariat, on whose behalf the Communists allegedly exercise their dictatorship, has reason to be devoted to the regime.

The general conditions of labor have greatly deteriorated since the inception of the present regime in Hungary. For example, a skilled mechanic in a shoe factory earns between 110—120 forints ($11—$12) per week. The ordinary working day is from 7 a.m. to 4 p.m. with a half hour for lunch.

However, even after 4 p.m. workers are compelled to stay in the plant approximately four nights a week to attend Communist seminars. It takes a week's work for him to earn enough money to buy a pair of shoes manufactured in the same factory. The average Hungarian worker has to put in 150 hours at work in order to earn enough money to buy one suit of clothes. For the same amount of merchandise, the American worker has to put in 25 hours (the Soviet worker, 580 hours). In other words, the Hungarian worker has to work six times as long for the same merchan-

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

dise as his U.S. counterpart, although he still has not descended to the level of the Soviet laborer, who has to work 23 times longer than an American worker. Compulsory labor is practicedin Hungary today through labor's loss of the right to strike and through the powers granted to the government to freeze workers in their jobs or to transfer them to other jobs at arbitrarily fixed wages. Moreover, several internment camps have been established where inmates are engaged in forced labor. Labor's loss of the right to strike is implicit in a law adopted in 1947, which set a penalty of five years imprisonment for stopping work in industrial plants. When driven to desperation by low wages and constantlyincreasing work norms, the workers resort to strikes; such strikes are either broken through intimidation or are brutally suppressed by the armed police. As a result of these laws,Hungarian labor has been placed in a state of involuntary servitude.

EDUCATION IS A COMMUNIST TARGET

Under the Communist regime education in Hungary has become a class privilege. The lower schools have been turned into instruments of propaganda and indoctrination; the universities have been transformed into party seminars;teachers and students of dissenting political opinion have been eliminated. The presence of police agents in the classrooms has made a mockery of academic freedom. The nationalization of all privately owned schools (i.e., church schools) in June 1948 and the concomitant nationalization of textbooks has resulted in the substitution of dialectic materialism for the precepts of Christian and civil morality. A vast network of government propagandists and agitators enmeshes the industrial plants, the army, the villages, the bureaucracy, and every phase of the national life. Mass demonstrations and public festivals, in which the citizens are forced to participate against their will, serve to mesmerize the population into artificial enthusiasm for the regime and to demonstrate the political and ideological outward unanimitytypical of totalitarian countries. Intellectual life is under the control of the Communist Minister of Popular Enlightenment;freedom of the press, of publication,and of expression has been strangled with the aid of restrictive laws and decrees, severely enforced by the Communist police and the subverted courts. Nothing may be published without the permission of the Press Chief in the Prime Minister's Office; nothing may be distributed without a license from the Communist Minister of the Interior. According to Act VII of 1946, ("Defense of the Republic") even true statements, made in the presence of two or more persons,that are considered inimical to the regime, are offenses punishable by the rigidly enforced law. Restrictive and discriminatory practices employed against the foreign press, including correspondents of Western newspapers and press agencies in Hungary, form part of a systematic campaign to isolate the Hungarian public from the West and to keep the Western public ignorant of conditions in Hungary. On the other hand, a scurillous propaganda campaign against the U.S. and the U.K. and the dissemination of government-controlled information in Western countries are designed to convince the population of the superiority of the Hungarian "people's democracy" over the "decadent imperialist-capitalist" states. At the same time they tend to confuse in Western minds the issues now at stake in Hungary and the orbit.

THE CHURCH HAS BEEN CRUSHED

The dominant religions in Hungary are Catholicism and Protestantism.

1896

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Approximately 68 percent of the population belong to the Catholic church, while 27 percent are Calvinists, Lutherans, Unitarians, and Baptists. Since both Catholicism and Protestantism hold to spiritual values that are opposed to Communist materialism and since both creeds represent strong ties to the West, the present regime has undertaken to eliminate their independent influence from the national life. The government's objectives regarding the churches, Catholic as well as Protestant, have been (1) the expropriation of ecclesiastical property with a view to rendering the churches financially dependent upon the state; (2) the nationalization of denominational schools and textbooks, so as to supplant Christian teaching with dialectical materialism; and (3) the elimination of the moral influence of the churches and their reduction to propaganda departments of the totalitarian state for the purpose of deluding the faithful into accepting the Communist-controlled regime as ordained by God. Thus, the main issue involved is not at all the traditional struggle in Europe for the separation of church and state, but rather a determined effort on the part of the totalitarian state to absorb churches which are already a separate entity.

After forcing the Protestant churches into accepting a subverted and government-controlled role in the national society, the Communist leaders began to concentrate on the Catholic Church. The first two over-all objectives, the expropriation of ecclesiastical property and the nationalization of schools, had already been achieved in 1945-46 and in 1948. Secondary objectives, such as the suppression of Catholic youth organizations, the curtailment of the Catholic press, and the cessation of Catholic religious broadcasts, had also been attained. The nationalization of parochial schools, however, created such resistance among the Hungarian Catholics that the regime decided to use a twofold strategy: The loosening of the ties which bind the Hungarian Catholic Church to Rome, and the instigation of division within the Church itself. Because of the uncompromising leadership of Jozsef Cardinal Mindszenty, resistance remained strong. In consequence, overt methods of persecution were resorted to: Placing police spies in churches; police surveillance of Catholic religious activities; confiscation and suppression of official church statements; invasion and seizure of convents; prevention or dispersal of religious processions and pilgrimages; and the arrest, imprisonment, or internment of priests and nuns.

These arrests culminated in the taking into custody of Cardinal Mindszenty, Prince Primate of Hungary, on charges of anti-republican conspiracy, espionage, and illegal dealings in foreign currency. The Cardinal was sentenced to life imprisonment after a staged trial in an irregular court. Even after this drastic step, however, the Catholic Bench of Bishops refused to come to terms with the government. While the state appears to have won a victory over the church, the issue is still awaiting final solution.

SUBVERSION OF A NATION

Apart from its religious and cultural traditions, which have made it an integral part of Western civilization for a millenium, Hungary has strong political traditions partly contemporaneous with, and partly influenced by, the political creed of the Atlantic Community. There have been times in Hungarian history when, although politically extinct, the state continued its constitutional

1897

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

existence. In fact, it was this deep veneration for constitutional continuity which preserved Hungarian national existence, occasionally at the price of a compromise, through successive periods of foreign conquest or domination beginning with the sixteenth century. It may well have been this constitutional tradition which, together with the isolated character of the national vernacular, made Hungarians an "indigestible" element in the Turkish and German-Austrian Empires. Whether or not technological implements available to the Soviet Empire, with its conglomeration of Slav, Orthodox and Communist elements, will be adequate to bring about the total assimilation of the Hungarian state and people in the orbit remains to be seen. There is as yet no indication that Hungarian "indigestibility," resulting from centuries of religious, cultural, linguistic, and political traditions, has decreased to any discernible extent during the past five years of Soviet political control.

Since the process of subjugating Hungary to Soviet-Communist control could not be arrested by opposition either at home or from abroad, the Hungarian people have gradually come to look upon Communism as an irresistible force. The Mindszenty and Rajk trials have served to strengthen this conviction, which deepens with the passing of each month, while the present regime is slowly being accepted as a permanent governmental system. The Hungarian people are said to be praying for war, since through a general conflagration alone can they conceive or regain their liberties. The Hungarians are a traditionally passive people who have reached a high degree of sophistication; in consequence they are prepared to accept the inevitable.

ON THE DANUBE. This peaceful scene is watched over by the church steeple. Will the strongly religious Hungarians regain their freedom?

At the same time, more and more of them are jumping on the Communist bandwagon, partly because of a sense of abandonment, partly because of opportunism, and partly because of successful propaganda. The general attitude of the people is characterized by a sense of futility and impotence and, at the same time, a longing for some miraculous return to the Western community of nations of which Hungary has traditionally been a component member.

The attitude of the population is aptly illustrated by this story. During a celebration, attended by farmers in a small Hungarian village, a microphone was set up in the church square and a Communist announcer from Budapest was exhorting the people to step up and say a few words about their life in the flourishing Hungarian "people's democracy." "Remember," importuned the announcer, "that your voices will be carried by radio waves over mountains, valleys and oceans!" An old peasant stepped up to the microphone and inquired anxiously: "Will my voice be heard over in America too?" Upon assurance from the announcer, the old man wiped his pendant moustache and yelled into the box at the top of his lungs: "H-E-L-P!"

THE NETHERLANDS EAST INDIES

GEOGRAPHY

The Netherlands East Indies (NEI), once referred to as Dutch possessions in the Malay Archipelago, comprise over 2,000 islands spreading from southeast Asia to Northern Australia. The main groups are Sumatra, Java, Madoera, Celebes, Bangka and Billiton, the Riow-Lingga Archipelago, the Mentawai Islands, the Lesser Sunda Islands, the Molucca Archipelago, and parts of Borneo and New Guinea.

From Batavia, the capital of Dutch administration, distances in nautical miles are approximately as follows: Darwin 1700, Singapore 570, Manila 1800, Hong Kong 1900, Tokyo 2600, Bombay 3000.

Almost all of the large islands feature a central area of rugged mountains with numerous volcanoes (some active in Sumatra and Java), descending to foothills, then to broad plains, and finally to large stretches of marshlands. There are considerable tracts of virgin jungle.

As the major portion of this territory lies south of the equator in the equatorial zone, the climate of the main areas of population, excepting the regions over 2,000 feet, is one of monotonously high temperatures and humidity, heavy rainfall.

Successive migrations over centuries make it difficult to identify the original inhabitants, and none of the main modern groups is homogenous. The total population is over 75 million, with the largest concentration in Java, estimated at 50 million. The bulk of the inhabitants are adherents to the Mohammedan faith. The largest element of

BALIKPAPAN. This pre-war shot shows the oil district. The NEI is a vital source of world supply of oil.

1899

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

the foreign population is Chinese, numbering about 2 million.

Although the various elements retain their individual languages (over 200), fundamental unity of speech exists throughout the entire area based on the Indonesian form. The official languages, however, are Dutch and Malayan.

The NEI has about 50,000 miles of roads, about 50 percent of which are in Java and Madoera. In other islands such as Borneo and Sumatra, rivers are an important part of communications. Java and Madoera also have the bulk of the railways, totalling 3,362 miles; Sumatra has 1,227 miles. Elsewhere, railways are negligible, and economic development is mainly based on coastal shipping.

RESOURCES

Considerable strategic war resources lie within the area of the NEI. There is primarily, dispersed from Sumatra, Java, and Borneo to Dutch New Guinea, petroleum in large quantities which may well be vital to the democracies in the event of another world war.

Present production of tin from Bangka and Billiton, more than 20% of the world total, is greater than prewar. Rubber exports are also approaching prewar figures. Other valuable resources are bauxite, manganese, nickel, coal, salt, and cement-making materials. The forests add teakwood for local shipbuilding, and sufficient quinine bark to fill the medical needs of the world.

The agricultural resources of the NEI are a most important source of wealth for a world in want. Food production is nearing prewar peaks with the annual rice export surplus estimated at 100,000 tons for the next ten years. The importance of the spices of picturesque early trading days has given way to foreign-credit-earning production of copra, vegetable oils, and sugar, with an ever increasing output of coffee, tea, tobacco, and sisal.

PIGS GO TO MARKET. Surplus food from the NEI is badly needed by the hungry world.

HISTORY

The period from the second to the eighth centuries in the East Indies was one of the assimilation of culture and the influence of Indian immigration, but in the thirteenth century, Islam became established in Sumatra. It spread along the trade routes, fully taking root by the sixteenth century, when the Portuguese made strenuous efforts to establish their stations throughout the Indies. They were soon challenged by the Spaniards, although the power of both had waned considerably by the end of the century.

In 1602, the Dutch East India Company was chartered. After ejecting the Spanish and Portuguese, it found new rivals in the English and French, but emerged virtually unchallenged.

By the middle of the eighteenth century, the Dutch had established

1900

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

their control throughout Java and extended it over the rest of the East Indian Archipelago. The French revolutionary wars and their effect on European commerce led to the dissolution of the Dutch East India Company, already weakened by corruption, when its holdings were taken over by the Netherlands Government in 1798.

When Java was successfully invaded by the expedition led by Raffles of Singapore in 1811, Palembang, Makassar, and Timor became British territory, but Dutch rule was restored in 1816 through the Convention of London.

From about 1930 onwards, Japan began interfering with Dutch interests, but the Dutch continually resisted all attempts to secure concessions until 1941, which saw the invasion and occupation of the Netherlands East Indies by the Japanese.

In the period between the Japanese surrender and the entry of Allied troops, the Indonesian Republic, headed by Dr. Soekarno, and claiming jurisdiction over the entire Netherlands East Indies territories, was proclaimed.

In February 1946, Indonesian representatives agreed to negotiate on the basis of a proposal from the Dutch Government for a structure for the Dutch Kingdom and Indonesia based on a voluntary partnership. By the end of June, the Republicans issued counter proposals asking for the recognition of an Indonesian Free State to work in alliance with Holland and to embrace all communities in the Indies who wished to be associated with Java. During this time, the difficulties of reaching an agreement were aggravated by hostilities between Dutch and Republican troops. Nevertheless, a large area of Indonesia with a population of over 45 million had agreed to the Dutch plan for autonomy.

The first real milepost was the Linggadjati (Cheribon) agreement reached in March 1947. It recognized the Republic as exercising de facto authority over Java, Sumatra, and Madoera. It provided for the Dutch-supporting areas of Indonesia to be incorporated gradually into a United States of Indonesia by 1949, and for this USI to become a unit in the Netherlands Union under the Dutch Crown. The agreement, like many others, was never put into force because neither side could agree upon its interpretation.

In July 1947, the Dutch began their first "police action," designed to subdue Republican areas which they claimed were controlled by extremists preventing settlement. On the initiative of Australia and India, the United Nations intervened. As a result, a truce was arranged and boundary lines established. Finally a new agreement was signed aboard the US transport Renville at Batavia in January 1948, whereby the Republicans agreed to recognize Netherlands sovereignty until the formation of the USI in January 1949. The Dutch promised to hold a plebiscite to decide whether Indonesians wanted to join the Republic or remain under Dutch rule.

A coup by Russian-trained communists was staged in September 1948. An all-out Republican effort was made to oppose the insurgents, and the campaign ended in December when the Republicans captured Suripno and Sjarifoeddin, after having killed Moeso, the instigator.

However, the Dutch made no move to hold a plebiscite, and the Republican government disregarded Netherlands sovereignty by trying to obtain international recognition in roundabout ways. For instance, at the Economic Cooperation Authority

1901

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

for the Far East Conference at Lapstone last December, the Republic applied and was accepted as an associate member. The Dutch delegation walked out, and a fortnight later Dutch forces launched a new "police" offensive against the Republic. These operations ended in the occupation of the Republic.

In reply to a UN Security Council resolution, the Netherlands Government has stated that it is prepared to establish an interim government immediately, hold elections, and transfer full sovereignty by the middle of 1950.

POLITICAL BACKGROUND

Indonesia has been politically part of the Kingdom of the Netherlands, ruled by a governor-general in the name of the Queen.

As the political and cultural center of Indonesian life, Java has always been the source of any national aspirations. Their formative inspiration seems to have been the Japanese defeat of the Russians in 1905. A few years after the founding of the first national movement in 1908, with its object only self-government, its three leaders were exiled.

In 1918, a representative body, the People's Council (Volksraad) was created. The following year, the Indonesian Communist Party(PKI) came into being, influenced by the Russian revolution. Several thousand alleged Communists were exiled to New Guinea, following an uprising in 1926, when the PKI was dissolved.

The Indonesian Nationalist Party (PNI)was formed by Soekarno in 1927. This was the first party to aim for complete independence, but in 2 years the leaders were all exiled or in jail. A moderate group found in 1937, the Indonesian People's Party, requested recognition of the term "Indonesians" instead of "natives," but was refused. When promulgated, the Atlantic Charter had a great reception in Indonesian political circles, but inquiry about its application to Indonesia by members of the Volksraad met with a non-committal reply from the Dutch government.

The Japanese dissolved all political parties, but after their surrender they recognized Indonesian claims for independence. The Dutch refused to negotiate with Soekarno, who was at the head of the promptly proclaimed Republic, and who had been decorated in Tokyo by the Emperor. But dealings with the more moderate Sjahrir failed to yield any satisfactory result.

The failure of the communist insurrection in September 1948 might well be due to the fact that communist objectives are at variance with the predominant faith of Islam. In addition, the Republicans, anxious as they were at the time to avoid a renewal of Dutch police action, were forced to take rapid steps to suppress the insurrection and so deny to the Dutch the opportunity to resume hostilities.

STRATEGIC SIGNIFICANCE

The barrier to British Empire communications which could be created by a hostile Indonesia can well be imagined, lying as it does across the Strait of Malacca and controlling movement between the Indian Ocean and China Sea. If her numerous air bases were occupied by an enemy power, it could do much towards the isolation of British Malaya, British Borneo, Hong Kong, and Australia from contacts from the west.

Similarly, a considerable amount of shipping could be effectively dispersed among the island's numerous port facilities for use either by or

1902

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

against a communist-dominated Asia.

Indonesia forms a natural line of advance from Asia to Australia's back door, and, with the development of air transport, brings a thousand million Asiatics only 24 hours away.

The resources of Indonesia are of great strategic significance, and their availability to the Western Powers in a future conflict is of the utmost importance.

The indigenous peoples of Indonesia have very strong religious, cultural, and social ties with other nations. They are able to call on the passionate moral support, and where possible, the material support of most, if not all, the peoples of Asia. In addition, their cause for independence finds favor with many European countries. They are bound by blood to the Malays of British Malaya and the predominant faith of Islam allies them directly with Pakistan and the Arab states in the Middle East. Considerable Indian influence is prominent in their culture.

Politically, the rise of the new Asia spirit automatically provides the basis of wholehearted solidarity between Indonesia and the rest of Asia.

Definite Russian interest and support has been forthcoming and there is a belief that much political unrest has been nurtured and nourished by the communists. In support of this is the Dutch claim of the capture of three Malayan-Chinese communist leaders in Sumatra, and the undoubted connection with Moscow of Republican leaders such as Moeso and Sjarifoeddin.

In their endeavors to gain their independence, the Indonesians have submitted their claims through the United Nations, but a member of that organization, Holland, has continually disregarded the efforts of the UN to obtain a settlement. Australia demonstrated great interest in the outcome of the struggle in the NEI, in view of the proximity of this area to her northern borders.

Apart from non-official trades union channels, the Australian government has been prominent in directing UN attention to Indonesian affairs, by granting de facto recognition to the Republic, and spotlighting the Dutch "police action." As a result, the UN set up an Indonesian Commission for investigation on the spot, and it also passed a resolution laying down a date for the granting of independence.

Asiatic countries are unanimous in their support under the leadership of India, which allegedly offered both sanctuary and arms to the Republicans. The Asian conference in January 1949 drew up resolutions recommending the granting of Republican independence. America supported the Republic's claim to independence, even to considering the withdrawal of Marshall Aid to Holland.

Russia made capital wherever possible out of condemning Dutch "colonial oppression." Without doubt, Russia fostered contacts of communists in Indonesia with those in Russia, China, Malaya, and Australia.

Combined pressures finally compelled the Dutch to grant full political sovereignty to the newly recognized United States of Indonesia. Indonesia, however, did not completely sever her connections with Holland. It was agreed that the Dutch Army and administration would be withdrawn, but Indonesia would remain an equal partner in the Dutch union of nations.

HUMAN VALUES & WORLD SECURITY

CONTINUED FROM PAGE 21

part of their rulers is, to use the Nazi phrase, "guns instead of butter." Because of the productivity of the people of the free world, it is possible for them to have both. Still, the necessity of collective defense deprives us all of the full advantages of our productivity. It is patently against the mutual interests of all peoples to forego the advantages of a world security based upon genuine cooperation in the United Nations.

That is why I believe that if the door to aggression is effectively barred by unified defense and the door to cooperation within the United Nations kept open, the day will come when the futile policies of expansion will be replaced by policies of cooperation in good faith. The great thing about the United Nations is that the shift can take place at any moment.

We must be continuously alert to the slightest step in the right direction. For it will take many steps, many demonstrations of good faith, many acts of cooperation to bring us to a point of mutual confidence which will enable us to resolve the larger issues involved in a new basis for world security.

U.N. SOCIAL AND ECONOMIC COLLABORATION

Meanwhile, the United Nations opens great vistas of opportunity for practical collaboration with most of the members on social and economic improvement. This is directly related to world security because the power to defend rests upon the stability of each society and the confidence of the people in their capacity to go forward. Indeed, the fundamental strength for collective security comes not primarily from the weapons for defense in hand, but from the over-all productivity of the people and their standard of life.

In the General Assembly, we acted unanimously in adopting a program for technical assistance to underdeveloped countries. In spite of the fact that this program involves the leadership of the specialized agencies in which the Soviets do not participate, their delegations supported the plan.

Not only can such specific cooperation efforts contribute to world improvement, but they also offer opportunities for broadening the collaboration in the United Nations. If we can do enough things together to meet practical needs of people, to restore trade, expand education, raise living standards, tap unused resources for human welfare, we can increase the confidence of peoples in collective security.

We are all very young and inexperienced in the art of consultation for common ends. We are used to making speeches in the public forum to interpret our individual views but not accustomed to multilateral consultation to formulate our common views. Here is a new challenge to statesmanship which we have only begun to accept. It has to do with seeking common understandings on which to rest ultimate agreements.

I dare say that by perfecting the process of consultation in the United Nations we may realize one of our

1904

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

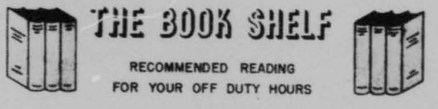
THIS PAGE IS UNCLASSIFIED

greatest hopes of eventually bridging the misnamed East-West chasm. In small groups or in pairs, delegates can explore opportunities in the mode of conversation more easily and effectively than in public addresses. They can seek clarification and definition of each others words, try out generalizations experimentally on specific situations, and be free to revise their judgments. In the process of consultation, they can exchange frank information about the feelings and attitudes of their respective peoples which throws light on why various delegations put emphasis on a different problem or solution.

We are carrying on this process of informal consultation on a broader scale than has ever been attempted. It already shows promise of creating a new basis for agreement. The permanent members of the Security Council have agreed to consult together in this way before major discussions take place in the Council chamber to see whether they can find an approach to unanimity instead of talking their way into an impasse and a veto. Likewise, the delegates of the Big Five and Canada have been exploring their differences on the problem of atomic energy in these informal consultations.

I recognize that it is a slow and unspectacular process. It calls for great patience. But if we persist in it, I think we may gradually work our way out of what appears to be impossible dilemnas. If we really anticipate the day when the facts of stability and strength in the free world will impress the Soviet leaders with the futility of pursuing their aims of expansion, then we can view with hope the possibilities for agreement through informal consultation. It is in such discussion that we may find the chances for the first steps and satisfy ourselves that they are sound steps.

State Dept. Bull. Dec 1949 Uncl



TITLE: Supersonic Combat

AUTHOR: J.L.H. Peck

SOURCE: Ordnance, Mar-Apr 1950

ADDRESS: American Ordnance Assn.
17th at Penna. Ave., N.W.
Washington 6, D.C.

The fact that supersonic jet-aircraft combat conditions require the development of better armament and tactics is shown through a discussion of tumbling bombs, ballistics, wartime fighters, jets, and target discrimination. The higher speeds employed result in fewer hits, even with the finest marksmanship. Target discrimination is discussed in relation to radar-identifying and gun-laying equipment, and fighter positions of attack utilized. Progress in fighter armament includes a new 20-mm automatic cannon (with a maximum effective range of about 2200 ft), a .60-caliber machine gun, an improved 75-mm cannon, and rocket-type missiles. Ballistic factors such as jump, yaw, drift, or dispersion, which are caused by very high speeds and which are not solved by present gun sights, are also examined.

AIR FORCE LETTER)
NO. 205-25)

DEPARTMENT OF THE AIR FORCE
WASHINGTON, 30 MARCH 1949

SECURITY

Disclosure of Classified Information to Reserve Forces Personnel

(Effective until 30 September 1950 unless sooner rescinded or superseded.)

	Paragraph
Purpose	1
Scope	2
Policy	3
Investigation and Clearance	4
Residents of Foreign Countries and Foreign Nationals	5
Requirements	6

1. Purpose. To provide uniformity, this Letter outlines the policy of the Air Force with respect to the dissemination of classified military information to Reserve Forces personnel.

2. Scope. This Letter applies to the Air Force Reserve and the Air National Guard, and in addition, its provisions will be followed in connection with activities concerning the Air Reserve Officers' Training Corps and the Senior Division of the Civil Air Patrol. This Letter does not apply, however, to personnel on extended active duty.

3. Policy. In compliance with the provisions of AFR 205-1 regarding security of military information, Reserve Forces personnel may be entrusted with classified information as follows:

a. RESTRICTED information may be disseminated for official military purposes to any Reserve Forces personnel.

b. Except as authorized in c below, information classified no higher than CONFIDENTIAL may be disclosed to Reserve Forces personnel not on active duty who are actively participating in official training activities, provided that possession of the information is essential to the training course or program.

c. SECRET information may be disclosed to Reserve Forces personnel on active duty for training purposes and personnel not on active duty who have a mobilization assignment, provided that possession of the information is necessary in the performance of officially assigned duties.

d. TOP SECRET material will not be used for training purposes in connection with Reserve Forces training programs. As authorized by paragraph 7, AFR 205-1, 14 March 1949, however, individuals serving on short periods of active duty whose assignments require it may be given access to the TOP SECRET information essential for the performance of their assigned duties.

e. Documents containing information classified higher than RESTRICTED will not be disseminated for retention by individuals. Such documents will be stored in military files only.

f. Reserve Forces personnel not on active duty who receive classified information will be informed that the information affects the National defense of the United States within the meaning of the Espionage Laws and that its revelation or transmission to an unauthorized person is prohibited.

g. Upon termination of active duty training, personnel will be briefed on the necessity for maintaining security of their professional knowledge while on inactive status.

4. Investigation and Clearance. Commanders concerned are responsible for requesting personnel security investigations and clearing personnel referred to in this Letter whenever required or necessary in accordance with separate Regulations.

5. Residents of Foreign Countries and Foreign Nationals. The provisions of AFL 182-4 and 8f, AFR 205-1, 14 March 1949, will be observed regarding dissemination of military information to persons residing in foreign countries, or to foreign nationals as defined in paragraph 2i, AFR 205-1.

6. Requirements. Although it is the desire of the Air Force to make available to Reserve Forces personnel such classified information as is required for training purposes within established training programs and courses, it is of primary concern that no breach of security will result from this policy. Commanders concerned will review continuously all classified material required by or of direct value to Reserve Forces activities, and whenever appropriate, will initiate down-grading action thereon in accordance with paragraph 27, AFR 205-1, 14 March 1949.

BY ORDER OF THE SECRETARY OF THE AIR FORCE:

---

*This Letter supersedes AFL 205-25 (formerly 46-7), 31 March 1948.
This Letter has been coordinated with and approved by the Chief, National Guard Bureau, as being applicable to the Air National Guard.

AIR INTELLIGENCE Review

This "Review" is published for three reasons:
1. To provide timely data regarding new techniques, practices and general information whereby intelligence personnel can maintain proficiency.
2. To provide material which will afford all personnel an appreciation of the intelligence role.
3. To provide a medium whereby all intelligence personnel and activities may exchange viewpoints, problems and solutions.

Two types of material are solicited for publication:
1. Stories and pictures relating to the intelligence activities being conducted within an organization.
2. Original articles of a noncontrovessial but informative nature.

Material submitted must include sources utilized and the authors name, rank and present military affiliation. Mail stories to: The Editor, "Air Intelligence Review," ConAC, Mitchel Air Force Base, New York.

WARNING— THIS DOCUMENT CONTAINS INFORMATION AFFECTING THE NATIONAL DEFENSE OF THE UNITED STATES WITHIN THE MEANING OF THE ESPIONAGE LAWS, TITLE 18 U.S.C., SECTIONS 793 AND 794. Manchuria,
A STRATEGIC TRAP

Major Martin F. Sullivan, Coast Artillery Corps

MAP 1
CHINA AND MANCHURIA

Since the end of World War II, communism has demonstrated a powerful militancy that has commanded attention throughout the world. Particularly in Asia has a positive communist militancy been evidenced. In China, sweeping Communist military successes represent the culmination of large-scale offensives in which Chinese National Government forces have been dealt a series of resounding defeats.

There has been considerable comment on the reasons for the failures of the Chinese National Government in the civil war against the communists. Most comment centers on many diverse, although relevant, factors. Despite the intimate connection between the political, economic, and military factors, an almost universal observation in regard to the war in China charges the steady disintegration of the Government's position to mili-

RAILWAY BRIDGE over the Shao Ling River, wrecked by the communists to delay the Government forces.

tary failures. In particular, reasons ascribed for the Nationalists' military debacle are: corrupt and incompetent leadership, ineffective tactics, and supply and transport deficiencies. Able observers and skilled reporters subscribe to these points of view. Writings by such individuals are often documented with specific charges. Facts so presented outline a progressive deterioration of Nationalist capabilities. This, in turn, had led to the establishing of the summer of 1947 as the point in time when the strategic initiative in China passed from Nationalists to communists.

INITIATIVE LOST IN 1945

While historians may have considered several aspects which deserve notice, exception to this viewpoint may be taken on military grounds. Militarily, the Chinese National Government forces never held the strategic initiative after the fall of 1945. Once committed to operations in Manchuria, it was impossible for Nationalist forces to resolve military aspects of the struggle for control which was then coming into sharp focus.

In China, a bitter political and military struggle between the Government and native communists had existed for nearly 20 years. This struggle was intensified by recurring military operations, and the Chinese communists maintained sizable ground forces that were organized, trained, and led by able commanders.

Overshadowed in a large measure by the Japanese war, this long-standing struggle was influenced by conditions resulting from the war in China and global events during World War II. Many influences could be explored: e.g., Yalta, the late General Stilwell, the Sino-Soviet pact of 1945, United States mediation in the civil war. Militarily, however, the fact remains that in 1945 the Nationalists could not accomplish required, concurrent missions, i.e., occupy, pacify, and consolidate simultaneously the vast areas of Japanese-held China and Manchuria.

Manchuria represented an enigma for the Chinese government. It was in Manchuria that the preliminary events to World War II may be said to have originated. It was over Manchuria that the Chinese ultimately fought the Japanese. The productive capacity and natural riches of the area were essential to rehabilitation of the war-damaged Chinese economy. Soviet occupation of the area, during the final week of the war, added to the complexity of the problems then facing the Chinese Government.

"CRADLE OF CONFLICT"

Manchuria has been called the "Cradle of Conflict" and the "Tinderbox of Asia." In fact, it had long been an arena in which the conflicting interests of Russia and Japan were pitted against each other. Historically, the area served as a battleground for those powers, despite

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

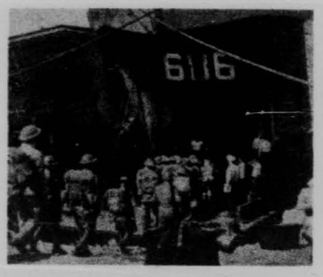
THIS PAGE IS UNCLASSIFIED

nominal Chinese sovereignty. The vast majority of Manchuria's population is Chinese, and China apparently hoped for the area to become the base of a long-range industrial development. Reoccupation of Manchuria was essential to China's needs and important to the prestige of the Chinese Government.

The Sino-Soviet treaty of August 1945 gave to the Soviet Union a preferential position in Manchuria. It is interesting to note that at a time when extraterritorial privilege was bowing out in China, the preeminent position of the Soviet Union should be established by treaty. Among the provisions of the treaty, there was a stated recognition of Chinese Government sovereignty over Manchuria; a promise by each signatory of non-interference in the internal affairs of the other; establishment of Dairen as a free port; and designation of Port Arthur as a joint naval base. The treaty also provided that the USSR should share ownership in the Manchurian railroad system. A significant part of this treaty was that the USSR agreed to render physical aid and moral support to China, and that this aid and support was to be given only to the National Government.

JAPANESE HELD AREAS

In regard to the Japanese held areas of China proper, several considerations had bearing on the situation. Consequent upon the struggle between the Chinese Government and the communists, an effort had been made to contain the communists. Even during the war, sizable Nationalist forces were committed to a blockade of the communist base area, around Yenan. While this effort was effective in denying communist movements either to the west or the south, it impeded in no way an extensive communist infiltration east and north



FIRST ARMY TROOPS boarding a landing ship which took them to Manchuria early in 1946.

into Japanese-held areas. Actually, the Japanese generally controlled and held only the principal cities and main lines of communication in North and Central China. The communists were able to extend an effective military and political control throughout rural regions of those areas.

When V-J-day arrived, the communists had forces that were disposed in the area of key cities, such as Peiping, Kalgan, Tsinan, Tientsin, Tsingtao, Nanking, and Shanghai. Government forces were located principally in South-Central and Southwest China. When Japan was defeated, a vacuum threatened to replace the relative political and economic stability that she had established and maintained in the occupied areas of China. The Government and the communists entered into a race for control of vital areas in North and Central China. In this race, the Government was at a serious positional disadvantage.

Although, in 1937, the communist armies had been designated as part of the over-all Chinese forces in a "United Front" against the Japanese, they were, in fact, independent of Government control. In August 1945,

A NATIONALIST COMMANDER and troops arriving at Chinchow.

Chu Teh, top communist commander, ordered his troops to move on the key areas of China, to take the surrenders of the Japanese forces in those areas, and to resist any interference with communist operations.

NEW PHASE OF STRUGGLE

With that order, a new phase of the long-standing struggle between the Government and the communists was signalled. It was apparent that if the communists could receive the surrender of large Japanese forces, they would gain the arms that would enable them to hold the vital areas of North and Central China. In most instances, Japanese field commanders did not recognize the communists as authorized to accept surrenders, and they adhered literally to the surrender terms which provided for dealing with Chinese Government or other Allied representatives. The action of Japanese field commanders, coupled with United States airlift of Nationalist forces to Peiping, Nanking, and Shanghai, and the arrival of the US Marine III Amphibious Corps at Tientsin and Tsingtao, had the effect of denying communist control of certain key areas of North and Central China. During September and October 1945, Chinese Government forces moved by US air transport approximated 110,000 men. These forces included three Chinese armies, each consisting of three infantry divisions.

The Nationalists faced difficult military problems at this time. They were responsible for the occupation of vast areas; disarming the widespread and numerous Japanese forces disposed throughout China, Formosa, and northern French Indo-China; and for providing the basis of Government control of key areas within China, against which communist attacks were likely. Despite the numerical strength of the Nationalist forces, then approximately 4 million men, time and space factors, among other considerations, precluded an immediate, satisfactory redisposition of available troops to fulfill required missions. Under the most favorable circumstances, it would have required 5 months to accomplish necessary Chinese Army moves within China proper. Soviet occupation of Manchuria, and an expected orderly take-over of that area at a later date by Nationalist forces, were factors the Government had to consider.

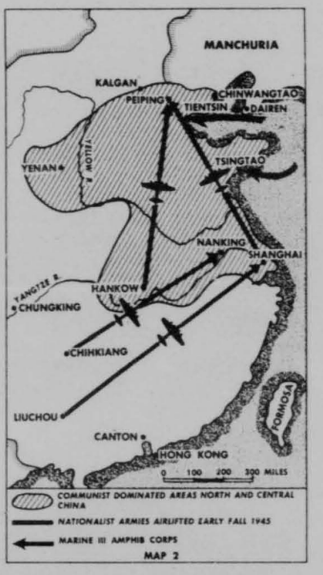
NATIONALIST MOVES

Nationalist occupation movements and operations during the early fall of 1945 gave the Government control of the provinces south of the Yangtze River and the principal northern cities. The broad communist control of rural areas of North and Central China, mainly established during the period Japanese forces occupied those regions, remained firm. In addition, the communists occupied Kalgan, the Mongolian gateway through the Great Wall to North China. This city became military headquarters for Eighth Route Army operations in North China and Manchuria. Kalgan was an important and worthwhile base of operations. It afforded factories, machine shops, and railway facilities. There, at least, the communists did take over considerable quantities of Japanese arms and equipment, including a reported 60 tanks. From Kalgan, communist operations were afforded depth and strength because they were backed by a base of power that was established across Soviet-dominated Mongolia, Siberia, and Manchuria. The Chinese communists, in effect, were the van of that base of power.

Communist troops, with the apparent objective of securing additional Japanese stockpiles of arms, made a number of abortive attacks on principal cities of North and Central China during this period. The Nationalists made immediate efforts to open and maintain communication between key cities and areas held by Government forces. They were, accordingly, committed to garrisoning these cities and to holding the rail lines and communication centers. Communication between the key areas was essential to the country's economic rehabilitation, apart from the logistical requirements of the Government forces. Communist forces in North and Central China, not committed to holding territory, made good use of guerrilla tactics. By continued harassing, widespread demolitions, and raids on smaller garrisons, the communists exploited their available resources. While avoiding positional warfare, communist forces often attacked in strength in order to force Nationalist shifts and redisposition of forces. Throughout the area of North and Central China generally, the communists held the tactical initiative.



MAP 2

COMMUNIST TACTICS

The military clashes in North and Central China were staged against a large and varicolored backdrop of national and international political and economic considerations. Communist tactics and operations were generally obstructive, denying Government consolidation of these areas, and having the effect of a continuing attrition on Nationalist men, money, and material. Communist operations influenced strongly politi-

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

cal and economic developments within China. However, communist movements and activities were of particular military significance. The extent and efficacy of communist operations frequently forced the commitment of Nationalist local reserves. Indicative of the relative dislocation of Nationalist forces in North China is the fact that approximately one-quarter million Japanese troops were still armed and guarding towns and communications there in November 1945. Generally, however, large stocks of Japanese arms and munitions were not available to the communists in North and Central China.

Reports of the arrival in Manchuria of elements of the Eighth Route Army, the main strength of regular communist organized field forces, were widespread during the fall of 1945. It was claimed that these troops were gaining large stocks of Japanese arms and equipment. Coupled with information concerning the large-scale looting of Manchurian industry by Soviet forces, the Government was faced with an increasingly serious and wider problem. The Government intended to recover the area of Manchuria both for its considerable essential industrial potential and its agricultural productivity.

SOVIET INFANTRY occupying Harbin to take the surrender of Japanese troops.

As a preliminary to taking over the area, Chinese government officials principally administrators and key technicians, had been sent to Manchuria. According to Chinese Government statements, they became virtual prisoners of the Russians. Soviet occupation forces were said to have warned such personnel they could not guarantee their protection. In one case, a group of Chinese officials which had gone to Manchuria with the consent of the Soviet commander was murdered near the Ashan mines. Soviet statements about the event were that "300 armed bandits" had murdered the Chinese officials. The Chinese Government claimed that only Soviet troops were in the vicinity and that Soviet guards were on the train in which they were killed. Thus, while Chinese military occupation of Manchuria had been a recognized requirement, based upon an eventual withdrawal by Soviet forces, such untoward events accelerated Nationalist efforts to enter the area.

SOVIET ACTIVITIES

Dairen, a principal port of the Far East, was the natural entry to Manchuria. Transported in United States ships, Nationalist forces were denied permission to land at Dairen by the Soviets, because of a narrow and literal interpretation of the Sino-Soviet treaty regarding the status of Dairen as a "free port." Following a hurried conference at Changchun between Chinese Government officials and the Soviet Far Eastern commanders, Marshals Vasilevsky and Malinovsky, it was announced that the Russians had guaranteed a landing in Manchuria. Dairen and Port Arthur were specifically excluded as landing places. The Soviets proposed Yingkow as the port to be used.

Ships of the US Seventh Fleet, under the command of Vice Admiral

THIS PAGE IS UNCLASSIFIED

Daniel E. Barbey, USN, were transporting Nationalist forces to Manchuria. A rapid movement from Dairen to Yingkow by this force had an interesting development. On arrival at the latter port, Soviet forces occupied the place. A parley between Chinese and local Soviet commanders resulted in agreement for a landing and take over by Nationalist forces the next morning. During the night, communist troops moved into the city and by daybreak were in entrenched positions ready to oppose the landing. Seeking to avoid intervention and involvement in what remained an undeclared civil war, the American ships withdrew and landed the Nationalists at Chinwangtao in North China. Denied the use of Manchurian ports by the Soviets, Nationalist troops faced strong communist forces grouped in North China and Manchuria across the remaining overland path of entry into the latter area.

TIME FACTOR

Time became a factor of increasing importance to the Government. It appeared necessary to consolidate and to pacify the areas of North and Central China. It was apparent that extensive military operations in those areas were required. However, reports persisted--some of them later substantiated--that the Soviets were permitting and probably assisting the entry of large bodies of communist troops into Manchuria.

While the communists had not gained appreciably large stocks of Japanese arms in North and Central China, the very considerable stockpiles of arms, ammunition and equipment of the Japanese Kwantung Army in Manchuria were reportedly becoming available to the communists with Soviet knowledge and consent. The communists were being given the opportunity or organizing a large military force in Manchuria and of establishing political and economic control there. Despite those developments, the priority of missions to be assigned Nationalist forces logically required first, that the areas of North and Central China be consolidated; and later, with their rear and flank secured, that Manchuria be occupied.

As a consequence, generally, only token forces were first allotted to the Nationalist occupation of Manchuria. These included the 13th and 52nd Armies landed at Chinwangtao, which fought north to Shankaikwan and Hulutao, giving two additional small ports of entry to the Nationalists. Newspaper reports at the time mentioned repeated Chinese attempts to negotiate with the Russians for flying Government troops into Manchuria.

Such reports referred to Soviet insistence on specific, narrow limitations regarding the time period during which Nationalist forces might be flown in before Soviet withdrawal. It was apparent that, under such arrangements, Government forces would be placed in unduly extended positions, and that troops so committed would exist as an island in an area fast becoming dominated by a growing communist troop strength. A new York Times correspondent in a dispatch from Chungking dated 20 November 1945, commented:

"The Russians seem to be following a policy of declining to hold Manchurian points until Chinese Government control can be consolidated and at the same time of taking no action to hamper the growing communist influence."

Although information was available that the Soviet forces then occupying Manchuria were systematically looting the area, the Chinese were, in effect, forced to request the Soviet on two occasions to postpone their withdrawal. In part, necessary

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

operations in North China made this essential. Three Nationalist columns were in motion in North, Central, and East China at the time. In the east, troops were being landed at Tsingtao and Tientsin preparatory to moving against communist forces in Shantung and Hopeh provinces. A central column was set in motion north along the Tientsin-Pukow railroad. West of this force, another northward movement was begun from Hangkow, aimed to clear the railroad to Peiping.

Coinciding with the Nationalist moves to reopen communications in North China, the Soviets announced their intention to withdraw from Manchuria. Faced with an expanding communist influence and military strength in Manchuria that was ready to move into areas evacuated by the Soviets, the Government was in a difficult position. The required campaigns of North China were, in effect, foregone, and the Nationalists, still denied the use of the chief ports in Manchuria, prepared to fight their way into the key cities there. Following a series of scattered clashes enroute, the Nationalists moved the 250 miles north from Chinwangtao into Mukden, arriving there on 12 December, following agreement with the Soviets for the takeover of the city. On that same day, one division of the Nationalist 94th Army was air-lifted into Changchun, 170 miles northeast of Mukden.

US POLICY

Announcement at the time of United States policy towards China had important bearing on later events. Pledged to a strong, free, united and democratic China, the United States pointed out the threat to world peace that existed as a result of the war and unsettled conditions in China. An immediate end of hostilities between the National Government and the communists was made essential.

In late December 1945, the communists, with a steadily worsening military position in North China, urged an "unconditional, immediate, and nation-wide truce." The government proposed that "all hostilities shall cease and railway communications shall be restored." The truce was agreed upon effective 13 January 1946. A specific agreement of this truce provided that the "cessation of hostilities order does not prejudice military movements of forces of the National Army into or within Manchuria which are for the purpose of restoring Chinese sovereignty." In addition, the truce stipulated that:

1. All hostilities would cease immediately.

2. All troop movements would also cease, except as noted regarding Manchuria, and south of the Yangtze where Government sovereignty was unchallenged.

3. All lines of communication would be cleared.

RESERVES COMMITTED

Based upon the provisions of the truce agreement and apparently reckoning that the "cease-fire" would guarantee the status quo in North and Central China, the Government then committed some of its best troops to Manchuria. From mid-January to mid-March 1946, the New Sixth Army and the New First Army, both US trained and equipped, were moved to Chinwangtao. Representing what is generally conceded to have been some of the most efficient fighting forces of the Chinese Army, these troops were, in effect, part of the Government's strategic reserves then avail-

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

able. Another reason that troops of the Nationalist strategic reserve were committed in Manchuria was occasioned by the eventual Soviet evacuation of the area, completed during the spring of 1946. The strategic position of communist forces in Manchuria, principally in the north and west-central regions, was such that efforts to occupy evacuated territory and regions would result in serious conflict.

In mid-April, heavy fighting broke out in Manchuria. As indicated above, one division of Nationalist troops had been airlifted to Changchun. This poorly equipped garrison of about 7,000 was attacked on 14 April by about 50,000 communist troops just as the last Soviet units withdrew from the city. Press reports stressed the communist use of Japanese artillery, machine guns, antitank guns, and mortars in the attack. At the same time, the Nationalist New First Army was driving north from Mukden area to relieve the Changchun garrison. This force was delayed by strong, prepared communist defenses in the area of Ssupingkai. With its relief held up in the south, the Changchun garrison was surrounded. Changchun fell to the communists on 18 April.

DANGER TO COMMUNICATIONS

Delayed for a month by strong communist defenses at Ssupingkai, the Nationalists had reason to ponder future moves, for communist operations in North China at that time threatened the main overland supply route to Manchuria. This route was tenuous. The available line of communication from China into Manchuria ran north along a narrow corridor between the mountains and the sea through Jehol province. Faced with the prospect of large-scale operations in Manchuria, this route was

recognized as inadequate and particularly vulnerable. Strong communist forces were based throughout Jehol.

Dairen, the natural entry and base of operations for Manchuria, was denied to the Nationalists. The main north-south railroads of Manchuria had a terminal there. Utilization of Dairen as a port and a base for operations would have provided excellent facilities and enabled a systematic build-up of forces, with a phased, secure northward movement. To open and maintain additional routes from Peiping to Mukden indicated further campaigns against greatly strengthened communist forces. The strategic position of communist forces in Manchuria proper at the time dictated that the Nationalists could hope to occupy only a deep and exposed salient there. The psychological advantage of the communists, operating everywhere in Manchuria within no more than 200 miles of So-

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

viet dominated areas, was of great importance.

Despite the announced truce in North China, fighting continued there. Widespread, large-scale operations remained likely in these areas. The decision had been made, however, and Manchuria continued to represent a steady drain on Nationalist strength. In June 1946, the Nationalists retook Changchun. Except for small bridgeheads established from time to time thereafter, they never moved north of the Sungari River. Nationalist military operations in the area were retarded by several truces during 1946. Limited activity was devoted to efforts at stabilizing a front along the Sungari and to consolidating the position in southern Manchuria. Even these efforts only extended further the Nationalists' limited strength. Successive communist offensives kept the Nationalists off balance during the winter of 1947. These increased in intensity. Casualties and a continuing attrition required that additional government forces be transferred from North China.

COMMUNIST STRATEGY

Such events demonstrated that it was communist strategy that was being successful. The Nationalists everywhere were reinforcing one area at the expense of another. Even in a "successful" defensive operation in Manchuria, the Nationalists lost men and equipment. US trained Government troops were committed to extended operations for which they were ill-suited. Taught to attack and experienced in offensive operations, they garrisoned cities and guarded rail lines. In continued defensive fighting, these units, lost well-trained officers and men as casualties. Ultimately, the US trained units lost their real identity through such attrition. A lack of replacements seriously depleted the strength of Nationalist units, and those which became available lacked training or experience.

The deterioration of Nationalist troop units in Manchuria was matched by a steady worsening of their military position. Communist interdiction of communications and isolation of the few cities held by Government forces progressed through 1948. Although events rushed to a climax during the early part of this year, the issue had been resolved about 3 years before.

Chinese Government forces, comitted to operations in Manchuria, were like an over-eager defensive tackle breaking into an opponent's backfield. The play calls for an easy entry. The tackle romps in and is set upon, hard. The Nationalists were in a similar position. It was necessary to do much with little. Despite the provisions of the Sino-Soviet pact of 1945, Soviet actions increased tremendously the Nationalists' problems. Soviet withdrawal from Manchuria precluded required operations in North China. Because of the operations of widespread and greatly strengthened communist forces and of Soviet actions coincident with Chinese communist moves, the Nationalists were forced to commit selected troops to Manchuria. A part of the Government's strategic reserve--likely never again reconstituted--these particular units deteriorated as a result of continuing attrition in purely defensive operations. Literally, "The Cradle of Conflict" and "Tinderbox of Asia" had become a "trap" into which a struggling Nationalist Government was inveigled and where its lot and fortune was largely lost.

COMMUNISM and ESPIONAGE

One of the real dangers of Communist-inspired espionage in the United States is this, in addition to the infiltration of paid espionage agents we must also steel ourselves to the ugly fact that espionage for the USSR is also carried out by men and women, who, though enjoying all the privileges and benefits of citizenship within the land of their birth or adoption, have still pledged their whole lives and their whole allegiance to Soviet Russia by their embracement of Communism, virtually as a form of secular religion.

The most recent grim example, treacherously betraying the men, women, and children of both the United States and Great Britain, was Doctor Klaus Emil Julius Fuchs, brilliant scientist, and British subject by naturalization.

Eliminating personal financial gain, for it apparently was not one of the principal motivating factors in this case, what were some of the motives that made this quiet, scholarly, and brilliant atomic scientist betray, first, the nation that had given him sanctuary from Naziism, and, second, the United States--at that time the arsenal of Democracy—with both nations then engaged in a fight to the death against the Hitlerism that had driven Fuchs from the land of his birth?

What are some of the underlying drives that motivate other citizens of free nations, and formerly free nations, to become died-in-the-wool Communist espionage agents for the Kremlin against the land of their birth?

These motives can only be complex, varying in intensity and character, as human individuals differ from one another. All we do is to seek out some of the answers by studying the documented cases that have developed to date, and then examine the personal lives and the backgrounds of the individuals involved, such as Doctor Fuchs, arriving at our own conclusions.

The conclusions we reach should then impress

American Communists enjoy our privileges, yet give their allegiance to Soviet Russia.

J. Edgar Hoover says there are 55,000 Communists. Behind them stand a half million fellow travellers and sympathizers.

Communism is the opposite of Democracy.

1922

upon each of us, again, the necessity for the absolute safeguarding of all classified USAF information from every possible weakling of the Doctor Fuchs, Alger Hiss variety. This discussion attempts such a study of Doctor Fuchs. The paragraphs in quotation marks are practically all from Fuchs' confession. The four counts under which Fuchs was indicted are underlined. The paragraphs in parentheses are a chronological account of Fuchs' activities. The discussions of possible drives and motivations are capitalized.

We must be eternally vigilant in safeguarding classified information.

"Fuchs originally joined the Communist Party in Germany before the rise of Hitler, leaving Germany for England in 1933 as a political refugee from Naziism."

Your alertness will weaken Communists.

(When Hitler came to power, Fuchs went underground in Germany, then went to France, and subsequently came to England.)

BECOMING IMPRESSED WITH AN IDEALISTIC VIEW OF COMMUNISM IN HIS YOUTH, FUCHS PROBABLY SAW IN RISE OF NAZIISM MANY EXTREMES OF SOCIAL ABUSE AGAINST WHICH HE REACTED VIOLENTLY. AS A MEMBER OF SUCH A MINORITY GROUP,THIS PROBABLY ENGENDERED A HATRED OF ALL POLITICAL ORDERS OPPOSED TO COMMUNISM,AMPLIFIED BY FACT THAT HE, PERSONALLY, WAS FORCED TO LEAVE HIS COUNTRY AND HIS ASSOCIATES, DUE TO HIS THEN-FORMING POLITICAL BELIEFS.

The first aim of Communism is overthrow of the government.

"From the time of his arrival in England,there was no evidence of an active association with the Communist Party."

Communists bore from within by getting agents into the government.

(Upon the outbreak of war he was classified as a refugee from Germany by one of the Tribunals which had been set up for the examination of aliens.)

IT IS COGENT TO REFER AT THIS TIME TO ONE OF THE TENETS OF COMMUNISM. IN POSSIBLE EXPLANATION OF FUCHS' APPARENT TEMPORARY RETIREMENT FROM ACTIVE COMMUNIST ACTIVITY UPON HIS ARRIVAL IN ENGLAND. IT NOT ONLY SUITED THE PURPOSE OF FACILITATING HIS "SCREENING" TO ESTABLISH A FIRM POSITION IN GREAT BRITAIN, BUT MORE IMPORTANT, IN THE WORDS OF LENIN, "WE MUST RESORT TO ALL SORTS OF STRATEGEMS, MANEUVERS, ILLEGAL METHODS, TO EVASIONS AND SUBTERFUGES...TO CARRY ON COMMUNIST WORK WITHIN...AT ALL COSTS." IN SHORT,

Be security conscious at all times, just as the Communists are revolution conscious.

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

AMONG COMMUNISTS, IT IS LEGAL TO LIE, CHEAT, OR STEAL, IF IT WILL SERVE THE PARTY'S ENDS OF THE MOMENT, AND FURTHER AS A BACKGROUND TO FUCHS' LATER ACTIVITIES, STALIN'S INJUNCTION TO WORLD COMMUNISTS IS, "TO STRENGTHEN OUR SOVIET INTELLIGENCE SERVE AND SYSTEMATICALLY HELP IT TO DEFEAT AND ERADICATE THE ENEMIES OF THE PEOPLE."

Communist aims cannot succeed unless the U.S. Armed Forces are destroyed or weakened by disloyalty to the government.

"In 1940, due to the threat of invasion, and because of his nationality, he was interned and sent to Canada."

"When the threat of invasion had passed, in 1942, he was returned to England and released from custody."

AT THIS TIME WE AGAIN FIND FUCHS AS THE CENTER OF AN UNPLEASANT PERSONAL EXPERIENCE. POSSIBLY INCULCATING EVEN MORE DEEPLY HIS RESENTMENT AGAINST ANY POLITICAL SYSTEM OR IDEOLOGY OTHER THAN THAT OF COMMUNISM.

Communists believe in combining legal and illegal work.

"Shortly thereafter, a scientific group in Great Britain requested his assistance in the projects. Reporting for this assignment, he signed a security pledge guaranteeing to safeguard the military secrets of the United Kingdom."

It is moral and legal for a Communist to lie, cheat, and steal if it serves his party's ends.

(At approximately the same time this security pledge was signed, he made contact with Russia through agents in the United Kingdom and started passing information on his work. It was at this time that Fuchs also stated in his confession he had allegedly divided his mind into two compartments, one compartment reserved for his daily contacts, the other reserved for his Marxian philosophy. Fuchs stated further that he had no particular fear of betraying himself because of the control which the Marxian compartment exercised over the other; described as controlled schizophrenia.)

Don't be hoodwinked by Communist propaganda. Expose it with the truth.

LENIN WROTE, "OPPORTUNISM MEANS SACRIFICING FUNDAMENTAL INTERESTS IN ORDER TO GAIN TEMPORARY AND PARTIAL ADVANTAGES." FUCHS, REALIZING THE NATURE OF HIS WORK, AND ITS IMPORTANCE IN THE ULTIMATE STRUGGLE, TAUGHT AS BEING INEVITABLE BETWEEN COMMUNISM AND CAPITALISM, WAS PROBABLY NOW MOTIVATED BY A SENSE OF PERVERTED IDEALISM--IN SHORT, IN HIS ATOMIC RESEARCH HE PROBABLY SAW A QUICK METHOD TO ACHIEVE A COMMUNIST VICTORY

Communism is a disease that can be quarantined by vigilance and a strong democracy.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

OVER THE REST OF THE WORLD, THUS BRINGING OTHER NATIONS UNDER COMMUNISM AS AN APPROACH TO UTOPIA.

"In 1943, because of Fuchs' specialized knowledge, he was sent to the United States as a member of the British Atomic Energy Team. At this time he renewed his security pledge."

CHARGE ONE: In 1943, did in England disclose atomic energy information to a person unknown.

Communists have one goal --world revolution.

CHARGE TWO: Between December 1943 and 1 August 1944, in New York, again disclosed such information.

CHARGE THREE: Did likewise in Boston in 1945.

CHARGE FOUR: Disclosed such information again in England in 1947.

Communists say that seizure of government by bloody revolution must come.

(During this period, Fuchs continued his Russian contacts and made new contacts in the United States. During the period he was passing information to Russian agents, he accepted one hundred pounds but stated this could not be considered as reimbursement but was merely a token payment, the acceptance of which reaccented his allegiance to the Communist cause.)

THE ATOMIC BOMB WAS NOW A REALITY! FUCHS, THE DELUDED LIBERAL, WORKING IN AN IVORY TOWER OF THEORY-BECOME FACT, ALMOST INCOMPREHENSIBLE TO THE AVERAGE MAN, WAS NOW PROBABLY SUBJECTED TO MIXED MOTIVES OF VAIN SELF-IMPORTANCE--MADE EVEN MORE DANGEROUS BY HIS APPARENT INABILITY TO CONSIDER THE BROADER ASPECTS OF HUMAN RELATIONS.

Anyone may be a spy Play it safe. Don't talk.

"In autumn of 1949, the United States advised Great Britain that there had been a leak of information through the British team and an investigation was started by the British. At about this time, Fuchs began to have some doubt about his course of conduct and informed British security authorities that his father in Germany anticipated going to the Soviet Zone of Germany to accept a position at the University of Leipzig."

Communists, body and soul, scorn the standards of American democracy.

"Fuchs was then confronted with the statement that there were certain allegations regarding his conduct in the United States and he was of-

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

fered the opportunity of confessing. He decided to leave the project on which he was working, and then, later, gave a complete statement, freely and voluntarily, of his relations with the Soviets."

(At the closing of the proceedings in England, Fuchs stated he had had a fair trial. He further remarked that in addition to being guilty of the indictment that he had also by his actions committed crimes against the friends who had trusted him. He was then given the maximum sentence, fourteen years in prison.)

Conclusion: The secret, close-knit, Communist underground will continue to function against us. It will not only use paid agents to secure vital military information, but will also augment these with many misguided and perverted zealots of the Doctor Fuchs type. Eternal vigilance and the absolute safeguarding of all military information are the only antidotes.

If every American faced the reality of what the fulfillment of the Communist objectives would mean to him--hewould be inspired to work harder to protect and preserve the individual liberty and freedom which is part of our American way of life.

Safeguard military information--Safeguard America.

RUSSIA TIGHTENS GRIP ON BALTIC

U.S. and U.S.S.R. Exchange Notes on Baltic Incident

The portion of this article dealing with Russian Baltic fortification is reprinted from U.S. News and World Report, an independent weekly magazine on national and international affairs published at Washington. Copyright 1950, United States News Publishing Corporation. Further reproduction prohibited. The text dealing with the exchange of notes between the US and the USSR is from the Department of State Bulletin.

The Baltic Sea, where Hitler developed much of his wartime submarine fleet and perfected his rocket weapons, now is being turned into a Russian lake.

New Soviet restrictions against use of the Baltic by other nations are becoming evident. A U.S. naval aircraft has been shot down as a warning to foreign planes to keep well outside a 12-mile limit off Russian-controlled Baltic coasts. Fishing vessels of Sweden, Denmark and Britain have disappeared, some known to have been taken by Russian patrols. Ferry service from Germany to Denmark has been halted. Normal communications in the whole region are being restricted. Something, other nations conclude, is happening in that part of the world.

The facts about what Russia really is up to in the Baltic, as pieced together from authoritative reports reaching Stockholm, London and Washington, show in some detail just what is happening, what the Russians don't want U.S. fliers and other foreigners to see. The reported facts are these:

A "total defense zone," closely guarded, has been set up by Russia along the whole southern coast of the Baltic. That zone is shown in the map facing. Along this 1,100-mile coastal area, from just east of Hamburg up to Leningrad, the Russians have built a network of missile-testing stations, big submarine bases, radar centers, fortifications, specialized naval shipyards and naval bases.

Security measures, extreme even for Russia, show the importance attached to this zone by planners in Moscow. All foreigners, except those working in Soviet installations, are excluded by a special policing force, said to be composed entirely of Mongolians. From Swinemuende, a Russian coast-guard fleet keeps non-Soviet shipping in the Baltic sharply restricted. Airfields are set up and well equipped with fighter planes and radar to prevent aerial reconnaissance of the zone. In much of the Polish portion of the zone, even Poles are excluded. Thousands of natives along the coast and from nearby islands have been evacuated.

Weapons-testing centers within that zone are one prime reason for these tight security measures. At Insterburg, for example, the Russians have set up an experimental station for new types of weapons. At Peenemuende, where the German V-weapons were developed, Soviet engineers are testing rockets and guided missiles. At Kolberg, in Poland, is another missile-testing station.

Big submarine centers also are be-

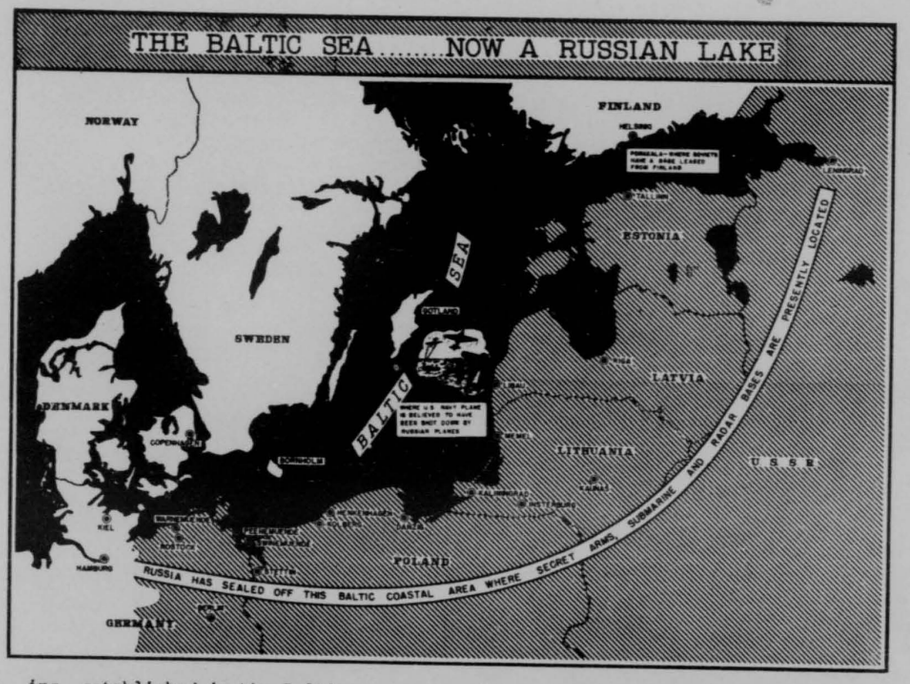
1927

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED



ing established in the Baltic zone. Bomb-proof submarine bunkers equipped to berth a large number of Russian U-boats already have been constructed at Memel, on the Lithuanian coast. That base is protected, too, by underwater nets against sneak submarine attack. In addition, fast, snorkel-equipped submarines are being constructed at Warnemuende, once a German seaside resort, and at Stettin, huge shipbuilding center.

Radar centers are being set up, too. A big radar station with new-type equipment, for example, has been established at Deep, in Poland. This station and others appear to form a radar screen for Russia's Baltic flank.

Naval bases and shipyards abound in the area. At Rostock, several German vessels are being reconverted into Soviet troop transports. At Warnemuende, a number of 600-ton torpedo boats are under construction. At Swinemuende is located the headquarters of the growing Russian Baltic fleet. A seaplane base is situated at Henkenhagen, on the Polish coast. And a major Soviet naval base is being expanded at Porkkala, located on the southern coast of Finland and leased in 1944 from the Finnish Government.

It was in the middle of the large array of secret Russian installations now being developed in the Baltic that the U.S. Navy plane was shot down last April. The facts, thus, indicate strongly that Russia's motive in that case was fear of any American reconnaissance of an area that is fast becoming the center of Soviet sea power and of missile development.

EXCHANGE OF NOTES ON BALTIC INCIDENT

The following is the text of a note dated April 18, 1950, from Ambassador Alan G. Kirk to the Soviet Minister for Foreign Affairs.

The Ambassador of the United States of America presents his compliments to the Minister for Foreign Affairs of the Union of Soviet Socialist Republics and, with reference to the note of the Ministry of Foreign Affairs of April 11, 1950, has the honor to state that the only American military aircraft which was in the air in the Baltic area on April 8, 1950, was a United States Navy Privateer airplane which disappeared on that date and no trace of its crew has since been found.

The United States Navy airplane carried ten persons. It was wholly unarmed. It left Wiesbaden at 10:31 a.m. Greenwich time for a flight over the Baltic Sea and two and one-half hours later reported by radio crossing the coast line of the British Zone of Germany. All American military aircraft operate under strict instructions to avoid flying over any foreign territory in the absence of express permission for such a flight from the appropriate foreign government. The investigation conducted by the United States Government had convinced it that the United States Navy airplane in question complied strictly with these instructions and did not fly over any Soviet or Soviet-occupied territory or territorial waters adjacent thereto.

In the Ministry's communication under reference the Soviet Government acknowledges that one of its fighter aircraft fired upon an American plane on April 8, 1950, at 5:30 p.m. Moscow time. In view of the fact that the only American military airplane which was in the air in the Baltic area on that date was the unarmed United States Navy airplane mentioned above and that this airplane was at no time after it crossed the coast line of Germany over any foreign territory or territorial waters, it must be concluded that Soviet military aircraft fired upon an unarmed American plane over the open sea, following which the American airplane was lost.

The Ambassador of the United States has been instructed to protest in the most solemn manner against this violation of international law and of the most elementary rules of peaceful conduct between nations. The United States Government demands that the Soviet Government institute a prompt and thorough investigation of this matter in order that the facts set forth above may be confirmed to its satisfaction. The United States Government further demands that the most strict and categorical instructions be issued to the Soviet Air Force that there be no repetition, under whatever pretext, of incidents of this kind which are so clearly calculated to magnify the difficulties of maintaining peaceful and correct international relationships.

The United States Government confidently expects, that, when its investigation is completed, the Soviet Government will express its regret for the unlawful and provocative behavior of its aviators, will see to it that those responsible for this action are promptly and severely punished, and will, in accordance with established custom among peace-loving nations, pay appropriate indemnity for the unprovoked destruction of American lives and property.

The following is a translation of a note handed on April 11, 1950, to

1929

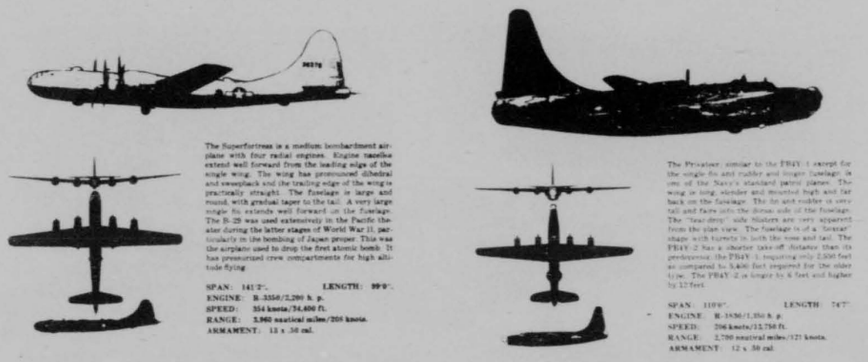
THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED



The Superfortress is a medium bombardment airplane with four radial engines. Engine nacelles extend well forward from the leading edge of the single wing. The wing has pronounced dihedral and sweepback and the trailing edge of the wing is practically straight. The fuselage is large and round, with gradual taper to the tail. A very large single fin extends well forward on the fuselage. The B-29 was used extensively in the Pacific theater during the latter stages of World War II, particularly in the bombing of Japan proper. This was the airplane used to drop the first atomic bomb. It has pressurized crew compartments for high altitude flying.

SPAN: 141'3". LENGTH: 99'0".
ENGINE: R-3350/2,200 h. p.
SPEED: 354 knots/34,400 ft.
RANGE: 3,960 nautical miles/205 knots.
ARMAMENT: 13 x .50 cal.

The Privateer, similar to the PB4Y-1 except for the single fin and rudder and longer fuselage, is one of the Navy's standard patrol planes. The wing is long, slender and mounted high and far back on the fuselage. The fin and rudder is very tall and faire into the dorsal side of the fuselage. The "tear drop" side blisters are very apparent from the plan view. The fuselage is of a "bonar" shape with turrets in both the nose and tail. The PB4Y-2 has a shorter take-off distance than its predecessor, the PB4Y-1, requiring only 2,500 feet as compared to 3,400 feet required for the older type. The PB4Y-2 is longer by 4 feet and higher by 12 feet.

SPAN: 110'0". LENGTH: 74'7".
ENGINE: R-1830/1,350 h. p.
SPEED: 206 knots/12,750 ft.
RANGE: 2,700 nautical miles/121 knots.
ARMAMENT: 12 x .50 cal.

COMPARISON. The identification pictures above illustrate the difference between the B-29 (left) and the PB4Y-2 Privateer (right).

Ambassador Kirk from the Soviet Minister for Foreign Affairs, Andrei Vyshinsky.

The Government of the Union of Soviet Socialist Republics considers it necessary to state the following to the Government of the United States of America:

According to verified data, on 8 April this year at 17 hours 39 minutes, there was observed south of Libava (Libau) a four-motored military airplane B-29 (Flying Fortress) with American identification signs, which went into territory of the Soviet Union for 21 kilometers. As the American airplane continued going deeper into Soviet territory, a flight of Soviet fighters arose from a nearby airdrome, demanding that the American airplane follow them for landing at the airdrome. The American airplane not only did not submit to this demand but opened fire on the Soviet airplanes. In view of this, the leading Soviet fighter was compelled to return fire, after which the American airplane turned toward the sea and disappeared.

The Soviet Government states a resolute protest to the Government of the United States of America against the gross violation of the Soviet border by an American military airplane, which is at the same time an unheard of violation of elementary standards of International Law.

Moscow, 11 April 1950.

STATEMENT BY SECRETARY ACHESON

Ambassador Alan G. Kirk has notified us that he saw Foreign Minister Vyshinski at noon today at the latter's request, at which time the Foreign Minister handed him a note in reply to ours of April 18 concerning the loss of the American naval airplane in the Baltic area.

We have just received the full text of the note which is being studied. Until the full contents of the note are examined by Departmental officials, I cannot, of course, make any full statement with regard to this Government's future course of action.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

A brief perusal of the note indicates, however, that the Soviet Government continues to defend its fictitious allegations that a B-29 airplane violated Soviet territory and fired at Soviet fighter aircraft. As you know, this Government had informed the Soviet Government that the only American military aircraft in the air in the Baltic area on April 8, 1950, was an unarmed United States Navy Privateer airplane.

It seems obvious that the Soviet Government has made no attempt to institute a real investigation of the matter in accordance with our request.

Until the Soviet note can be examined by the Department, I do not wish to make any further comment with regard to it except to say that there does not appear to be any new information in the note which would cause this Government to alter its position as set forth in its note of April 18.

STATEMENT BY MICHAEL J. McDERMOTT
CHIEF PRESS OFFICER

The American Ambassador at Moscow has presented to the Soviet Ministry of Foreign Affairs the United States Government's reply to the recent Soviet protest against an alleged violation of Soviet occupied territory by an American aircraft. The American reply corrects the distortions of fact which the Soviet Government has injected into the incident and puts the matter in its true light as an attack against unarmed Americans.

After investigation it has been determined that the facts of the matter are as follows: An unarmed American Navy plane with 10 persons aboard was shot down by Soviet fighter planes over the open waters of the Baltic Sea. No survivors have been found despite an extensive search.

The Scandinavian countries have been very helpful and cooperative in the humanitarian rescue work undertaken in connection with the disappearance of this plane. The American Government is deeply grateful for their assistance, which has rendered possible thorough search undertaken throughout the past week. By contrast, there has not been the slightest evidence of any concern on the part of the Soviet Government over the fate of our plane and its personnel. This seems an astonishing lack of common international courtesy and an unusual disregard for the loss of human life.

Moreover, the Soviet Government has thus far shown no sign of regret for its attack against an American aircraft. Instead, it has taken an aggressive tone and attempted to justify its action by impossible allegations. It has charged that the American aircraft fired first, when the American plane had nothing with which to shoot and was too slow a craft to attack fighters. Moreover, it has attempted further to confuse the issue with false propaganda claims and diatribes against the United States in the controlled Soviet press.

This attitude of the Soviet Government shows clearly the insincerity of its oft-proclaimed desire for peaceful relations with the United States and the non-Soviet world in general. The cause of peace is not furthered when the U.S.S.R. ostentatiously decorates Soviet airmen in a manner calculated to give the impression that they are being rewarded for shooting down a defenseless American plane.

RECOMMENDED READING FOR YOUR OFF DUTY HOURS

TITLE: New Soviet Jet Fighter

AUTHOR: W. Green

SOURCE: Skyways, May 1950

ADDRESS: Henry Publishing Company
New York, N.Y.

High Air Force personages and officials have confirmed the existence of advance-design jets in Russia. Drawings based on telephotofilms are as accurate a reconstruction as is possible on the available evidence concerning the new Soviet jet fighter which has a lay-out as advanced as an American or British jet in service. This Soviet fighter is actually in large-scale production and is being delivered to crack Soviet air force fighter squadrons. Crux of the latest designs is that they not only embody in practical form the advanced ideas of German technicians now working for the Soviet, but are almost certainly powered by a new powerful range of turbojet engines, including copies of the Rolls-Royce Nene and Derwent jets imported from Britain. The new fighter is as advanced in lay-out as the F-86 Sabre, combining 40 swept-back wings with a sharply swept-back fin and "T positioned" tail plane. Maximum speed of the Soviet fighter is as high as 690 mph. At medium altitudes it might even match the F-86, and should be easily capable of reaching any fighting formations of B-36's and B-50's. Apparently with a combination of German airframe designing genius and the world-famed Rolls-Royce Nene turbojet, this Russian fighter would appear to be an extremely formidable opponent.

TITLE: Combat--8 Miles Up

AUTHOR: Colonel N.F. Silsbee

SOURCE: Skyways, February 1950

ADDRESS: Henry Publishing Company
New York, N.Y.

Combat at altitudes of eight miles and up is reviewed from the fighter and bomber pilot's viewpoint. Flying our improved jets or actually fighting with them at such altitudes are two entirely different things. Except for a few experimental models airplanes so far can only operate in the troposphere. For jet engines, the critical feature is the turbine temperature. Combustion efficiency becomes more difficult to achieve as the jets tend to "flame out" at the reduced throttle settings. The present advantage of the bomber may be summed up in the jet fighter's sluggishness at extreme altitudes, which gives the bomber a definite edge in maneuverability, and the greater range of the bomber's electronically fixed heavy guns. Present USA, British, and Soviet interceptor models are discussed, and the question of armament vs speed as defense for the bomber at high altitude is taken up.

NEW EXPERIMENTS WITH AF B-36

The chart below graphically portrays the amazing comparisons between the B-36 and the former Air Force heavy bombers. Left, six trucks line up to deliver the 21,116 gallons of gasoline and 1200 gallons of oil required to fully load the B-36. This service alone points up the tremendous logistical problems involved in the upkeep of these huge craft.

Engineers are still experimenting to improve this giant, the tremendous size of which is illustrated when compared to the B-24 in the picture to the right. The remaining two pictures on these pages show an artists conception of jet pods on the plane in flight (lower left) and an actual jet-assist take-off (lower right).

Pictured on the back cover is the track-tread landing gear mounted on the "X" model of the B-36. Initial taxi-tests are being conducted at Convair's Fort Worth plant. This type landing gear, still strictly experimental, is expected to spread the 358,000 pounds of the B-36 over a larger area of the landing strip. The gear will reduce the 156 lb psi pressure of the conventional gear to an average pressure of 57 lbs psi. Only 5600 lbs are added to the plane's weight.

POLAR GUIDE

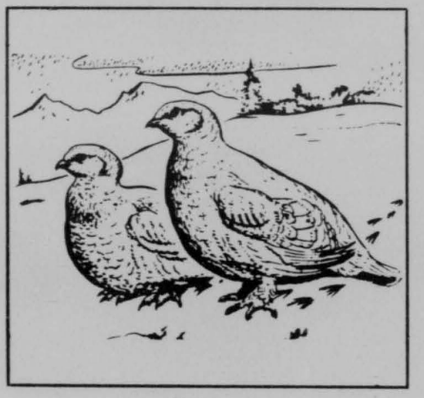
This is the thirteenth of a series of articles on Arctic Indoctrination

Chapter 18—Land Survival (continued)

BIRDS

All polar birds are edible, as are their eggs. Many northern birds nest in colonies that run to thousands of pairs. Near such a colony a man can keep alive all summer—even without a gun.

Ducks nest in grassy margins of ponds or on clumps of grass in marshes. If two of you are on the hunt, try dragging the ground with a rope to find the nests. When the rope passes over a nest, the sitting bird will fly off. You can also try catching the mother bird with a simple trap made of your mosquito headnet, parachute cloth, or any other cloth fastened over a firm frame. If no ready-made netting is available, you can make a net of parachute cord by one of the methods described in AF Manual 64-0-4, "Emergency Uses of the Parachute" which is in the pocket of every parachute pack. Fasten the netting or cloth to two curved pieces of wire hinged together with round eyes. To set the trap, fold the net back on itself, peg the bottom firmly into the ground, then prop up the top wire with a two inch stick; the net should lie in accordion folds. Then run a long, stout cord, fastened midway on the top wire, through a low, firmly planted wicket outside the spot where the net will fall when released. The cord should be long enough to allow you to lie concealed at some distance from the trap. When the bird takes the bait (placed at the back of the open trap), pull the cord quickly. With this trap you can get birds on the nest, birds hunting food, and ground squirrels. If large and strong enough, it will



Ptarmigan.

Deadfall.

1935

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Rock trips.

also serve for hares, ptarmigan, large gulls, ducks, geese, and swans. A trap two feet in diameter at the hinge line serves for most birds and small mammals.

After you catch the mother duck, take the eggs--whether strictly fresh or not, duck eggs are a feast for a hungry man.

Gulls can be caught with a hook baited with fish liver, entrails, or meat. Float the bait on a piece of wood. You may be able to catch a gull on the tidal flats with a rock or log deadfall. Set up a flat rock or log on a prop and put bait underneath it. Scatter bits of bait around the rock but fasten the larger chunk well back so the gull will have to go under after it. When the gull comes up and reaches for the bait, pull the prop.

For about two weeks, during the midsummer molting season, all ducks, geese, and swans (as well as many other waterfowl), lose their flight feathers all at once and become flightless. Diving ducks (such as eiders and old squaws) usually spend this time at sea; these you must get with a gun. Young eiders, geese, and swans hatched on inland waters far from the coast usually grow up there and during the flightless period are easy quarry for your shotgun. You may even succeed in catching half-grown geese and swans by hand.

The nests of auks, puffins ("sea-parrots"), murres, and similar birds are on certain rocky inland or mainland cliffs in the polar regions. On Greenland's west coast, Eskimos catch the little auks with hand nets. You can take puffins at their nests dug in turf, but look out for their savage beaks. Murres are especially abundant in high cliffs such as those at Cape Wolstenholme and the eastern end of Coats Island in Hudson Bay. All these are good food because they are fat.

In summer, ptarmigan (polar grouse) are so well camouflaged with protective coloration that they are hard to see, even when they are running. In winter, they are white, with black tail feathers that show only in flight. Ptarmigan are found both in low country and on ridges. In late summer and early autumn, you may come on broods of unsuspicious young; these you can kill with stones. Willow clumps are good places for ptarmigan snares.

Slingshots are excellent for killing ptarmigan, other birds, and small game. A powerful and durable slingshot can be made of one of the two-foot metal rods from your plane's tie-down kit (or any similar metal bar), two twelve to fourteen-inch lengths of elastic shock cord, a piece of webbing or belting from the material in which the parachute is packaged, and some fine copper wire.

To obtain the greatest food value from birds, pluck rather than skin them. If you can, pluck geese and ducks while they are still warm.

FOOD PLANTS

Food plants are found throughout

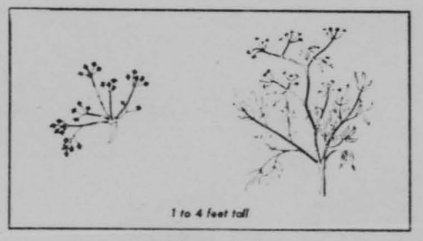
WARNING

There are only a few polar plants that are poisonous. Learn to know them, for they are dangerous.

WATER HEMLOCK

This plant belongs to the parsnip or carrot family, as the leathery, toothed leaves, and small flowers arranged in clusters suggest. The leaves are streaked with purple and when crushed emit a disagreeable odor. Do not eat any part of this plant or plants similar to it, even though the parsnip-like roots look inviting.



Water Hemlock.

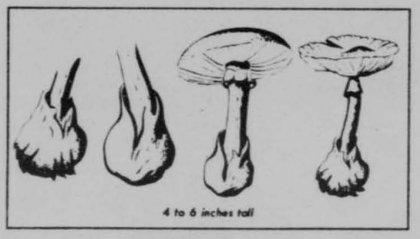
BANEBERRY

You can easily recognize a baneberry by the cylindrical cluster of red or white berries borne at the tip of the stem. The berries may turn blue as they get older. The baneberry grows throughout the wooded areas of Alaska and Western Canada. Do not eat it.

Baneberry.

DEATH-CUP AMANITA

This mushroom occurs in damp forests. Usually, it is completely white, but the cap may have tints of orange, purple or brown. When fully grown, the cap is four to six inches wide. When young, it is steeply convex on top, but later it flops downward from the center like an inverted saucer. The surface is sticky when moist. Beneath are white gills attached to the underside of the cap, but not to the stem. The stock is white and brittle and has a spherical base that is buried beneath the ground and that rests in a soft white cup which is not visible until the entire plant is exposed. This plant is poisonous.



Death-Cup Amanita.

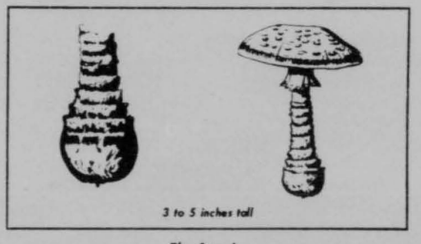
FLY AGARIC

This is a handsome mushroom with a yellow, orange, or red mottled cap, whitish or yellowish scales, and white gills. When these fungi are young, they may be mistaken for puff balls. However, breaking them discloses the gills.

EMETIC RUSSULA

This mushroom usually grows in the woods. You can recognize it easily by the top of its "umbrella", which is pink or rosy when young, and red or yellowish when older. If you eat this mushroom, it will probably make you vomit; hence its ill effects are neither serious or lasting.

No plants of the polar or sub-polar regions are seriously poisonous to the touch. A few, however, such as *ladyslipper*, and *devil's club* are irritating to some people. So do not touch them.



Fly Agaric.

the polar regions. Lichens, particularly, are almost universal. Most of the plants in the polar region are edible. Certain kinds, however, have more food value than others. Once you have learned to recognize a good food plant, study its surroundings carefully, so that you will know where to look for it the next time you need it. Watch the animals, especially the birds. They will lead you to food sources you might otherwise overlook.

LICHENS

Though lichens lack flowers, leaves, stems and roots, they have possibly the greatest food value of all polar plants. Caribou live almost entirely on lichens for months at a time. Some lichens contain a bitter acid that may cause nausea and severe internal irritation and therefore should not be eaten raw. However, soaking or boiling the plants in water (if possible, with a pinch of soda) removes the acid. If you cannot cook them simply soak them overnight, pour off the water, and eat the residue. However, lichens taste better when boiled. Do not be repelled by the gelatinous appearance of boiled lichens.

Lichens are most palatable if prepared as a powder. Soak them overnight, then dry the lichens till they are brittle. You can make them crisp by roasting them slowly in a pan. Afterwards, powder the dried plants between your palms or pound them with a stone. Soak the powder a few hours, then boil it until it forms a jelly. Use this jelly to thicken soups and stewed vegetables, or cook it with meat, especially if meat is scarce, for the lichen jelly will stretch it out. A mixture of flour and lichen powder may be used as a base for nutritious biscuits.

Rock tripe is a lichen consisting of thin, leathery, irregularly shaped discs, one to several inches across, and black, brown or greenish in color. The discs are attached to rocks by very short central stalks. They are soft when wet but hard and brittle when dry. Iceland lichen is dark brown, bushy, coral-like plant with individual straplike "branches" that have hairy edges. It grows in dense colonies on sandy soil. When properly cooked, this lichen is palatable and nourishing. Reindeer lichen is a grayish, many-branched, coral-like plant that prefers hollows or slopes with winter snow cover. It is as nutritious as Iceland lichen. Northern hunters make a stimulating tea from it.

BERRIES

All berries except the baneberry are edible, and berry bushes are abundant. The bushes are low-growing; sometimes they form mats. Despite their small size, individual bushes are good producers. Frequently berries remain on a bush throughout the winter, and the following year are even sweeter than those of the current season. If you wish to preserve the berries, freeze them into bricks; freeze them quickly and thoroughly. Start the process right after you pick the berries in order to preserve maximum food value.

The mountain cranberry (lingon) is a low creeping shrub with leathery evergreen leaves. It grows best in open birch or willow thickets and has red berries that are high in vitamin content.

The blueberry is a low shrub with small oval leaves that drop off in winter. It grows in open places. The berries are blue to blue-black.

The cloudberry (salmonberry or baked-apple berry) has small maple leaves. Its berries, which resemble raspberries, are reddish when imma-

THIS PAGE IS UNCLASSIFIED

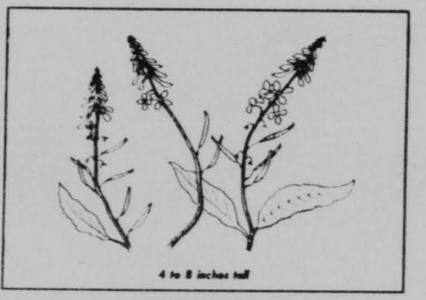
Wild rhubarb.

Spruce cone.



Willowweed.

ture but yellow when ripe. The raw berries are somewhat laxative. Their flavor is much improved by cooking.

The crowberry is one of the most abundant and widespread polar plants. Its slender leaves resemble fir needles, and its berries are shiny black. It grows along shelves on rocky ridges and hills where the snow is not deep, and therefore can be found even in winter.

The alpine bearberry is a trailing shrub with shreddy bark and round-tipped leaves that turn bright red in autumn. The berries are black or red and are rather tasteless. Related to this is the red bearberry (kinnikinick), with coral-red berries that are somewhat mealy and tasteless when raw but very nourishing and palatable when cooked. The dried and shredded leaves make a fairly good substitute for tobacco.

The cranberry occurs in similar marshy areas and on shaded upland ledges, particularly where peat moss (sphagnum) occurs. The berries are red and may be rather sour.

EDIBLE ROOTS

Several polar plants have roots that store energy-giving starches. All these roots are called masu by the Eskimos. To get the roots you will need a digging tool, unless you can succeed in stealing them from the underground runways near the surface, where they are stored by meadow mice. Eskimos use dogs to nose out the caches. Even though you have no dogs, try to spot these stores and save yourself a lot of digging.

The commonest root is northern sweetvetch (licorice root) which grows in clumps on sandy soil, especially on lake shores or along streams. It has pink flowers similar to pea or clover flowers, while its leaves resemble those of locust trees or the famous locoweed of our western states. Learn to recognize the leaves so you can find the roots when there are no flowers. The cooked root tastes like young carrot but is even more nourishing.

Another valuable root is that of the woolly lousewort which grows in dry tundra. Flowers of this plant are rose colored, resembling those of the licorice root in shape but arranged in denser clusters. The flower stalks are thick and strong and are visible long after the flowers have dropped off. During the winter, the leaves and flower stalks

THIS PAGE IS UNCLASSIFIED

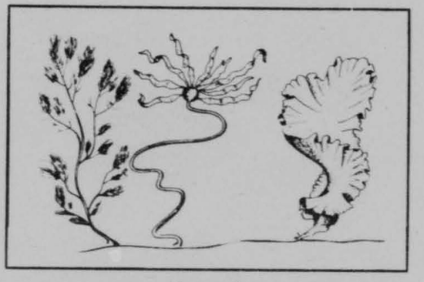
Dandelion.



Seaweed.

may be visible above the snow. The sulphur-yellow root is large and sweet. It is edible either raw or cooked.

Bistort or knotweed, also common in dry tundra, has small white or pink flowers that form slender spikes. The elongated smooth-edged leaves come out from the stem near the level of the soil. The root is about the size of a pecan, and is rich in starch. The slightly acid taste of the raw root disappears when it is cooked. Soak it in water for several hours and then roast it.

Kamchatka lily (saranna) grows in meadows and among low shrubs along the Pacific coast of Alaska and on the Aleutian Islands. Its flowers are shaped like other lily flowers. The stem rests in a large bulb surrounded by small bulblets about the size of rice grains. The bulbs serve as potatoes for the natives of Kamchatka because they contain large amounts of carbohydrates. People have lived solely on this bulb for long periods. Roast the bulbs in coals or boil them. Dried and powdered bulbs make good bread, soup, or porridge.

ANTISCURVY PLANTS

Scurvy has taken its toll of men in the polar regions. This dread disease results from vitamin C deficiency and may be brought on by prolonged diet of canned or lean meat and no vegetables. Most plants yield some vitamin C, but several are notably rich in this antiscurvy vitamin. Among these is "scurvy grass" which occurs along sea beaches. It has small white flowers and globular fruits; the lower leaves, borne on short stalks, are kidney-shaped. All parts of the plant are somewhat fleshy. The leaves, stems, and fruit, eaten raw, are valuable antiscurvy food.

Spruce twigs and leaves are also rich in vitamin C. Black and white spruce occur throughout the sub-polar forest and, in general, reach farther north than any other evergreen trees. They have short stiff needles borne individually, not in clusters as are pine needles. The cones are only one or two inches long and have thin scales. Black spruce cones are globular, while those of white spruce are slightly elongated. A strong infusion prepared by boiling young twigs and leaves in a covered pot, prevents and cures scurvy. The buds, needles, and stems, have a strong resin taste, but give some antiscurvy vitamin C when chewed raw.

The fresh green leaves and inner

1941

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

bark of the dwarf polar birch also are high in vitamin C. You can distinguish the birch from its companion shrub, the willow, by its thinner leaves and peeling bark.

GREENS

Several polar plants are fairly good substitutes for the leafy vegetables of our civilized diet. Some of these plants contain vitamins and minerals, and all of them give bulk to your diet.

An important green is wild rhubarb (alpine fleece-flower) which grows on open river banks and recent landslides. The stems are reddish and, like cultivated rhubarb, bear pointed leaves with wrinkled edges. The flowers form scraggly clusters. The young stems are bright red and juicy. When cooked, they resemble rhubarb in flavor.

Another green is sourgrass (mountain sorrel), which lives on moist, shady slopes and in ravines. Its fleshy, kidney-shaped leaves are borne on long, slender stalks, and its red or green flowers are arranged in plumelike branching clusters. The leaves and stems taste somewhat acid when raw but are very refreshing. When cooked, they resemble spinach in both flavor and appearance. New leaves are produced all summer, thus supplying fresh greens in any summer month.

Still another leafy plant is the willowweed (fireweed) which grows on sandy or gravelly soil along rivers and on beaches. It has purple flowers and fleshy, slender leaves. The leaves resemble spinach when cooked.

A woody plant in this list is the willow. This is the "tree" of the polar region, yet it often looks anything but tree-like because it grows close to the ground and spreads out like a cushion. Its cottony seeds are conspicuous during the spring when they are ripening and blowing around. The young, tender willow shoots contain a large amount of vitamin C and may be eaten as greens. They have a decidedly sour flavor.

Dandelion, a weed pest in the United States, is a potential lifesaver to anyone stranded in the polar regions. The young leaves make fine greens. Cook them only a short time, and bear with their bitter taste. Both leaves and roots can be eaten raw.

Marsh marigold is found in swamps

Marsh marigold.

Cow parsnip.

1942

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

and along streams and is one of the earliest plants to come out in the spring. The leaves and stems, particularly of young plants, are delicious when boiled.

Cow parsnip is abundant on the Pacific coast of Alaska and on the Aleutian Islands. Its large size and characteristic flower cluster make it conspicuous. The entire plant dies down to the ground each winter. Cow parsnip resembles the poisonous water hemlock of the subpolar forest. Both plants belong to the same family and have very similar flower clusters. The leaves, however, are entirely different. Learn the difference so that you can tell the plants apart. The young shoots and leaf stalks of the cow parsnip are edible either cooked or raw. Leaf stalks that have rusty or reddish spots or streaks are better than solid green ones. If there is no fresh water available, chew the leaf stalks of the cow parsnip. They will quench your thirst because they contain much water.

SEAWEEDS

Seaweeds should be on your menu whenever possible, especially if you eat much fish. They contain valuable vitamins and give bulk to your diet. In fact, they do the same thing for your emergency rations that lettuce, cabbage, and many other foods of little food value do for your normal diet. The bulk they give helps prevent constipation. The gelatinous consistency of cooked seaweed may offend your senses of sight and taste, but it is just what you need to round out your diet. Indians, Philippinos, Hawaiians, Chinese and many other peoples have eaten seaweeds for centuries.

Three kinds of seaweed are common:

Brown ribbons, several inches wide and amazingly long, which float in the surf, anchored by a slender stalk.

A profusion of small, brown, branched forms which make a jumbled mass on the rocks exposed at low tide.

Very thin green, wrinkled sheets of "sea lettuce" which grow on rocks, driftwood, other seaweeds, and on mud flats in quiet bays.

Take care in the selection of seaweeds for your stew pot. Fresh, healthy specimens have no marked odor or flavor and are firm and smooth to the touch. If the plant is wilted and slimy and has a fishy smell, it is decaying and should not be eaten. The large, brown, ribbon-like seaweeds can be either minced and eaten raw, or dried, shredded and scattered over other food. Discard the stalk and other tough parts; eat only the tender portions. The coarser red seaweeds are best if cooked; they are gelatinous and are most palatable if used with fish to make a stew. The broad-leaved "sea-lettuce" is good chopped and can be eaten raw or stewed. Do not eat the threadlike or slender branched forms. They are not poisonous but may contain irritating free acid. You can detect disagreeable acids by crushing a batch with your hands. The released acid causes the plant to decay so rapidly that within five minutes it gives off an offensive odor.

MUSHROOMS

It's a good idea not to eat mushrooms. In the first place, a number of them are toxic. In the second place, they don't have much food value.

RUSSIA BEAT U.S.? WEST IS GAINING

The following article, a reprint from U.S. News and World Report, is reprinted here because of its timely interest. Whereas no grave issue is taken with the general summary presented, it seems pertinent to observe that optimistic projections under present delicate and highly uncertain circumstances must be tempered with a certain measure of caution. To make such accomodations and reservations, of course, does not imply rejection or prejudice to the validity of the thesis as presented. On the other hand, however, a realistic estimate of the situation, as a continuing reappraisal of the military strength of a potential enemy,must place its major emphasis upon current capabilities. It provides but small comfort for a commander to know that he is favored by time when he is also aware that time is of the greatest essence. The vital question to be answered is--will the enemy strike while he has preponderate advantages in so many departments, or will he wait, knowing full well that any hesitation on his part works to his infinite detriment? Given time,the West will undoubtedly be in a position to accept any challenge, but--will the West be given time? (The Editor)

Stalin's chances of winning an early war are slipping away. Russia's fighting power is great, but West is overtaking her.

Trouble in the satellites, weakness in industry, raw materials, food, transport, all put checks on Moscow's strength.

West, meanwhile,is getting stronger, sharpening defenses. A shooting war, as things stand, means a stalemate nobody wants.

A shift is occurring in the military balance of power between Russia and the West. The atom bomb, in Russia's hands tilted the balance her way for a time. Now the swing is back, a little toward the side of the West.

War plans of a firmer sort backed by big arms shipments to Europe; new weapons that discount Russia's edge in tanks and man power; time, improved morale, all account for the rising military confidence of nations in the bloc U.S. leads.

Distrust of satellites, suspicion of political ambitions of top generals, weaknesses in transport and industry, at the same time, are lowering the confidence of Russia's dictators.

Russian power, on paper, still ap-

STAKHANOVITE FOREMAN. Skilled workers are not too plentiful.

1944

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

pears overwhelming in Europe. Russia's divisions outnumber those that could be put against her by 4 to 1 or more. She has tanks in superabundance. Russia's plane numbers exceed the combined total of the West. Her atom bombers are only one or two hours from Europe's big cities; barely 12 hours from the U.S. West coast, 18 hours from the industrial centers of the Midwest, 16 hours from the East coast.

Military leaders of the West are well aware of all that and more too. Yet the assessment they are making of war potentials and the chance of victory in any future war shows a sharp shift to optimism. The hopeless feeling that ruled not long ago is giving way to a degree of confidence. Given time--one year more, two years at most--Russia's chance of winning a war in Europe will be much reduced, or gone.

Behind this new confidence are strong indications that Western means of defense are catching up with Soviet means of attack. New weapons that are deadly against tanks are appearing. "Baby" atom bombs soon will be available as multiple-purpose tactical weapons against Russian land forces. New devices to combat the serious threat of Soviet submarines are in sight. Radical new antiaircraft weapons that can shoot down enemy planes before they come into sight are near production. And divisions of well-armed troops are starting to emerge in Europe. Moreover, joint defense plans are drawn up in Europe, ready for practical use on a moment's notice if the West is attacked.

Thus, the base is being laid for a powerful offset to Russia's immense strength on land. That strength is being reassessed by the military and economic analysts in the light of all this, and is found to be wanting in many elements that would be required to assure victory at this time in war that would involve the United States. Russia, on the basis of conclusions being reached, could not conquer U.S.

Cold facts and figures out of which that conclusion by military planners grows are provided in what follows. There is a report on Russia's existing military power, her potential power, the industrial base that must support this power. And there is a progress report on Western strength in men and machines for war. In these facts and figures, together with knowledge of new weapons for defense, are found the reasons for much of the growing confidence on the part of military leaders in the West.

Military strength of Russia, in men and equipment, appears overpowering. Yet the appraisers are finding weak spots and serious limitations in that strength.

Divisions. In Army man power, trained, experienced, Russia cannot be challenged. In readiness now are a minimum of 170 divisions. These are smaller in size, but equal to most Western divisions in armor, artillery, heavy equipment. They are opposed by 43 Western divisions, of which only about 25 can be used in Western Europe.

There are questions about the effectiveness of this Russian man power in an offensive war. Satellite troops are not trusted by the Russians. Soviet troops, in an attack on the West, are expected to lack the incentive they had in World War II when they defended their homeland.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Moreover, their transport is poor, unsuited for long offensive thrusts. And, if fighting is confined to a narrow front in Europe, mere numbers are less important than they appear.

If military strength depended solely on the number of divisions and men under arms, Russia nonetheless would have little trouble overrunning Europe and defeating U.S.

Tanks. Here, too, Russian superiority in numbers is overwhelming. Soviet divisions are equipped with 40,000 tanks, many of them far bigger than anything the West has now. They are opposed by only 6,000 Western tanks. If each side used half of its tanks in Western Europe, for example, the Soviet advantage would be more than 6 to 1. That advantage, however, is being reduced by development of a "radical" new U.S. antitank weapon, described by Gen. J. Lawton Collins, Army Chief of Staff, as being able to revolutionize tank warfare. In other words, a defense against vast numbers of tanks--the Russian's biggest threat in a land assault—is in sight.

Air support. In combat planes, again, Soviet forces have a numerical edge on the West, with about 16,000 planes in readiness compared to about 14,000 combat aircraft

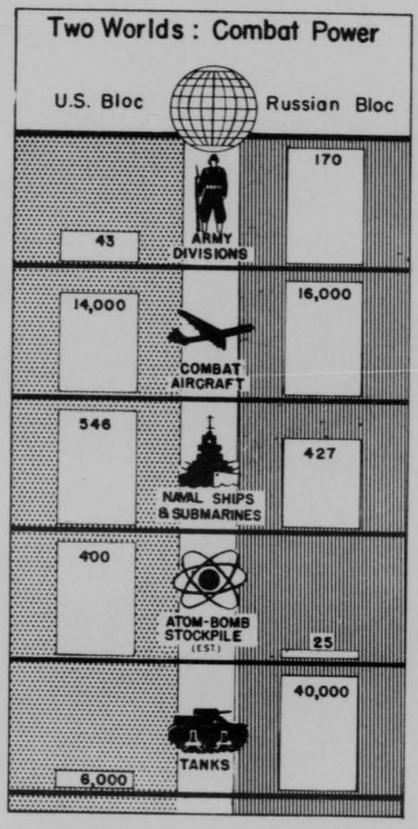
1946

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED



available now to the U.S. bloc. Most of these Russian aircraft, moreover, are fighters or fighter-bombers of postwar design, for use in supporting the big infantry-tank teams in land assault. That makes for a powerful air cover for Russian attacks, giving air superiority that would be difficult for the West to overcome.

Soviet bombers, in addition, now can strike anywhere in U.S. with atom bombs. Russia is known to have about 300 bombers of the B-29 variety, plus a jet bomber in production, and a B-36 model in the blueprint stage. Moreover, new bomber bases are being constructed on the Chukotsky Peninsula opposite Alaska and in the Murmansk region near Finland, the two areas of Russia that are closest to the United States.

But, as in tank warfare, the defense is catching up to these means of attack. Antiaircraft rockets able to knock down any bomber flying as high as 60,000 feet already are in "advanced development" in U.S. Also, new antiaircraft missiles, guided electronically, are promised soon and indicate a sure defense against conventional aircraft.

Russia's combination of more divisions, more tanks and more planes gives her an unquestioned advantage in offensive power, despite weak points. But military strength includes other things too.

Geography. The area over which any big Russian attack would have to go, for one thing, favors the defense. An invasion of the United States would be greatly complicated by intervening oceans. Assault on Western Europe, as the map on page 35 shows, must be confined to a relatively narrow corridor across the northern plains unless it is attempted through easily defended mountain passes. In that corridor, a small number of well-equipped divisions could hold off a far larger force. To the south, Russia is hemmed in by a long wall of mountain ranges, so that a small force also can hold an attack in that direction.

In other words, a Russian sweep across Europe—where any future war

1947

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

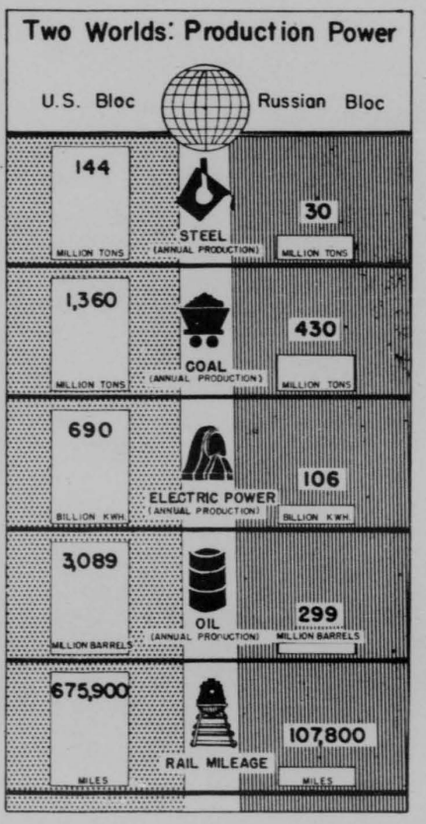
THIS PAGE IS UNCLASSIFIED

is expected to center--must gothrough bottlenecks in which small Western forces can use new antitank, anti-aircraft and other defensive weapons with telling effect, while long Russian lines of communication are subject to bombing and mass sabotage that could wreck a poor transport system.

Atomic weapons. But the big trump card for the West is its stockpile of atom bombs, large and small. While Russia's stockpile, eight months after her first atomic explosion, is certain to be less than 25 bombs, U.S. is believed to have at least 400 bombs on hand at this time. With U.S. bombers able to deliver wholesale atomic retaliation for any attack on the West, this provides a big deterrent to Soviet aggression that will be good until the Soviet stockpile, too, is large. It is expected to be at least another two years of time for Western preparation.

And, equally important, U.S. production of "baby" atom bombs for tactical use gives the West an unequaled defensive weapon for stopping Soviet land assaults and destroying Soviet communication lines. That coupled with geography, means the West is getting the means to stop Russian attacks on necessarily narrow fronts, as high defense officials see it, without the need for hundreds of divisions and more thousands of tanks.

Naval power. The same thing is happening at sea, where the defense also is catching up. Russia has a big edge in submarines, the offensive weapons of any new war at sea. About 300 of her 427 combat ships are submarines, designed to cut Western life lines in war. Yet new weapons and techniques for detecting and destroying these underwater craft are being revealed by Western naval forces, with 546 combat ships available now.



Result is that sea defenses are being strengthened, and the seas are likely to remain under control of the West, not Russia. That, in effect, keeps U.S. strength in Europe, prevents an invasion of this country

1948

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

by sea, keeps Western supply lanes open.

What it all adds up to, from a military viewpoint, is this: Russia clearly has the edge in offensive strength. She has the masses of men under arms, the advantage in tanks, the fighter planes to support offensive land action, the ability to bomb both Western Europe and U.S., and a large fleet of submarines to attack Western life lines. The West has relatively little offensive strength, but a growing amount of defensive power. It has the weapons to stop vast numbers of tanks, and a growing number of divisions equipped to use them. It has weapons in sight that can cut the effectiveness of Soviet air power, maybe stop it cold. It is getting the means of destroying enemy submarines. And it is aided by geography that tends to prevent Russia from invading U.S. and hinders Soviet forces in offensive action to the south or west.

But military strength is only part of the war strength of each side. Back of military power is economic power. Unless one side or the other wins any war at the out set, economic power will decide.

Economic potential of the Russian bloc, as the chart on page 36 indicates, is much less than that of the West. Since 1945, Russia has restored her output to prewar levels and has rebuilt many factories, power plants and other facilities destroyed in World War II. She still suffers from grave weaknesses, however. In a war, if she could not win quickly, they would handicap her more and more.

Steel production, by past Russian standards, is high. In territory under Soviet control, output reached 30 million tons last year, may rise further to 35 million tons in 1950. That exceeds the 27 million tons Hitler had available for war preparation in 1938 from Germany, Austria and Czechoslovakia. Yet it is less than one fourth of the production of the U.S. bloc, and thus could prove a weakness in a wartime production race.

Other metals, such as magnesium, lead, zinc, copper, aluminim and tin, are in ample supply in Russia. For war purposes, she would be self-sufficient in those materials.

Coal output in Russia, too, is believed great enough to sustain a war economy. Output last year of Russia and satellites was about 430 million tons. A goal of 600 million tons is in sight. The West, however, already turns out twice that.

Electric-power capacity, vital for Soviet war production, is being steadily increased from last year's level of 106 billion kilowatt-hours, but needs already are outrunning available supplies. Western output, in contrast, totals 690 billion kilowatt-hours yearly, more than six times that of Russia.

Equipment of various kinds required by Russia to back up her war production is being turned out in factories of Czechoslovakia, Poland and Eastern Germany. This output, including machinery, machine tools, trucks and tractors, is subject to widespread sabotage. In items such as precision instruments needed in war, there is a pronounced shortage.

In all those war essentials--steel, coal, power, machinery, trucks and tractors--Russia is at a big disadvantage compared with the Western nations. Her handicap is still more serious in other fields, however.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Greatest weaknesses of Russia's economy are her shortages of oil and rubber, her scant supply of food, her poor transportation system, and her lack of skilled workers.

Oil produced by Russia and her satellites is only one tenth of the amount of production to which U.S. and the other Western powers have access. Russia is especially short of facilities for making high-octane gasoline, needed for airplanes. In a war of movement, Russia would need great quantities of oil to operate her tanks and trucks. If she managed to overrun Europe, she might find that, without oil, she would not make Western Europe's economy function.

Rubber is even scarcer in Russia. Her needs have greatly increased, as the numbers of trucks, tanks, planes and motorized guns have multiplied. Besides, her rough roads wear out tires at a rapid rate. She is known to have imported about 160,000 tons of rubber last year, but she goes to great lengths to conceal the amount of her synthetic production. The high priority given to rubber imports by Russia is indicated by her payment in gold for heavy purchases of rubber from Malaya. Last year she tried to buy Ceylon's entire crop, but that move was blocked by U.S.

Food supplies in Russia, chronically short, would be cut still further if war comes. Without lend-lease supplies this time, lack of adequate food could become a major weakness in a future war effort. Production now, for example is only back to prewar levels, while Russia's population has increased more than 20 million.

Transport problems, in turn, keep Russia's economy basically weak,

INSIDE A SOVIET SUBMARINE. The life-line cutter is losing its edge.

hold back the industrial growth needed to support a major war. City-to-city highways, of the type known in U.S. and Western Europe, are almost nonexistent. Railroad mileage in Russia's world, despite vast distances to be covered, is only one sixth that of countries in the U.S. bloc. Train speeds are slow. Railroad routes are roundabout. What makes the problem worse is the fact that the various elements of Russia's production system—coal, iron, grain and population—are badly placed in relation to one another.

Engineering problems also play a big part in retarding Russia's industrial growth and war preparation. Ever since the late 1920's, her drive for increased production has been slowed by lack of skilled workers and trained engineers. For a long time, during World War II, U.S. made up the lack through lend-lease, by supplying Russia with many complex machines of advanced type.

Now, Russia is thrown back on her own resources. Making matters worse, from her standpoint, is the fact that among the refugees who have escaped to the West since the war are thousands of engineers. The reason

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

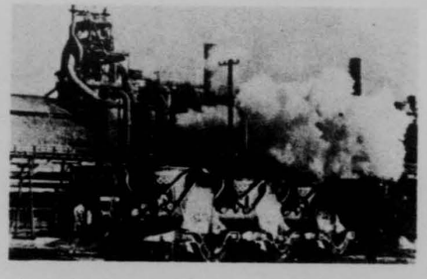
THIS PAGE IS UNCLASSIFIED

is that, in Russia, where errors of judgment often bring a death sentence, an engineer is always in danger. Partly offsetting this loss, Russia has acquired many German engineers. But the lack of skilled workers and administrators remains a drag on production.

These economic handicaps, in a long war, are certain to limit Russia's military strength, in spite of the basic advantages of large area, varied resources and big population.

What Russia can do, then, on the basis of her present military strength and economic potential, is being assessed by Western defense officials this way:

Against U.S., Soviet capabilities now are limited to bombing and sabotage. Without control of the seas, the planners agree, no large-scale invasion of the United States is possible, even with large numbers of transport planes and submarines. Atom bombing, to which the industrial U.S. is highly vulnerable, is likely to be limited by a growing warning system and the use of potent new antiaircraft weapons. U.S. can be badly hurt with atomic weapons, but, even though bombing is severe, the strategists insist, Russia cannot reach and defeat U.S. in armed conflict at this time.



BLAST FURNACE AT MAGNITOGORSK. By past Russian standards, steel production is high.

Against the Near East, Russian capabilities are greater. A determined force, with adequate air cover, might push down through the Caucasus, in the Near East oil area, even across North Africa. But, with the aid of mountain terrain and tactical atom bombs, a relatively small Western force including the Turkish Army probably could stop such an offensive.

Against Western Europe, however, the main Soviet assault is expected, if war comes. This is considered the No. 1 prize of a World War III. Yet the Western generals now are convinced that, with their new defensive weapons, that area could be held by only about 30 divisions. This strength, under the new 12-power organization, is rapidly being approached. Then, with a line held in Europe, the West's superior economic strength is counted on to win out in the build-up of forces that would follow.

Outlook, with the Western means of defense thus gradually overtaking the Soviet means of waging an offensive war, is for a stalemate of long duration, rather than a quick victory for Russia, if war comes. Each side now is getting into position to inflict heavy damage on the other. Yet neither side, at this time, has the edge in offensive strength needed to win.

A PROGRAM FOR NATIONAL SECURITY

**Report of the Advisory Commission on Universal Training--
with an Introduction by Air Training Command**

This is the first installment of a series.

Intelligence, in its broadest sense, is the function of accurate and factual presentation of the more realistic probabilities regarding the means, and the methods of dangers to the security of our nation. The ambiguous and often overly imaginative "possibilities" are only an alternative choice. This, in its broadest and yet basic essence, is the "know your enemy" essentialized over a score of centuries ago by soldier-philosopher Sun-Tzu.

From this knowledge of the "capabilities" of one's enemies, it becomes possible to assess what one's own safeguards and capabilities should be to curb and repel eventual face-to-face military attack.

Since that philosophy of Sun-Tzu became words long ago, many are the successively great nations and great powers that arose and fell to form the history of this civilization.

To bring these thoughts to date, one problem individually and collectively faces us of the Air Force, the Defense Establishment, and the United States as a nation--the security and protection of which is our military structure's sole reason for existence. This problem is the knowing of our enemy (Communist Russia and World Communism) and adjunctively the knowing of ourselves (and our place as the backbone of the free world). From this realization must come the molding of a superior total capability able to repel and defeat the military aggression so easily an offshoot of prolonged "political" aggression.

A gross understatement is the statement that much confusion exists in the world and in these United States today. Witness the daily assertions and counter-assertions: "which-way-and-why-ism", peace or re-armament, etc., of various public proclamations. Some serve a need and a purpose in molding public thought. Many serve no other purpose than to create confusion, fear, distortion and vacillation. Many are made by well-meaning personalities. Others are fed into the hopper of public consumption by either ill-meaning, shallow-thinking or just plain misguided souls who know not what they do.

Like Mr. and Mrs. America the individual officer and airman finds himself be-deviled by these multi-faceted public utterances. Like Mr. and Mrs. America the individual officer and airman must arrive at definite conclusions--or picture definite even though distant goals of what must be done to hold him on a constant course and prevent his falling individually and collectively a victim to the welter of expoundings. In short we must, individually and collectively become able to keep "both feet on the ground."

With this essential need in mind the following study is presented. In itself an extract from a study undertaken and compiled by a select, unbiased, non-politico group of our nation's leading citizens for our nation's President, it gives all a

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

clearly defined picture necessary to maintain mental equilibrium. It separates itself into four broad areas:

(1) A picture of the motivations and the devious methods utilized by our nation's enemy, short of war. (Not stated as such, but Russia by process of elimination.)

(2) A picture of the probable vicious forms of attack that will probably be utilized by our enemy when, and if, actual military attack begins.

(3) A picture of the necessary internal health we as a nation must retain to prevent inner crumbling—i.e. individual and collective mental, physical and economic health. This is combined with our place of prime responsibility in leading the free world.

(4) A picture of what we as a nation will require for minimum military security if war should come—i.e., what Air Force, Army, and Naval capabilities industrial production and dispersal, civilian defense, etc.

In all--although only the forepages of a complete study basically intended and slanted to the pros and cons of universal military training—it is believed a clear-cut document which fulfills the broadest essence of intelligence. In its portrayal of what our enemy is doing short of war and what vicious methods of attack to expect when war should break—balanced by what we must do to counterbalance both of these exigencies--it is believed must reading for all.

Against this picture the Air Force individual can weigh the daily portions of confusion and counter-confusion, rejecting those pronouncements that do not intelligently fit into the picture of these goals and accepting as reassurance those that do.

To sustain the weight of soundness which the following program in process would possess, the following is offered.

George F. Kennan, counsellor for our State Department and a veteran of 23 years in our Foreign Service, has rapidly become recognized and respected as one of the Western world's most able "Russian experts."

Writing under the anonymity of "Mr. X" he first attained widespread public acclaim in 1947 for a clear-cut, revealing expose of Soviet inner machinations and motives in a discourse entitled "The Sources of Soviet Conduct." (July 1947 issue of "Foreign Affairs"--Quarterly Review) His, also, are one of the credited "brains" behind the conception and creation of the Marshall Plan. (How close to home his analytical revelations of the Soviet inner sanctum have been is proven by the constant tirade and defamation directed against his name by the Soviets in profuse propaganda denunciations—always most violently directed against those who endanger their plans for world conquest).

Writing for the March 1950 issue of the Reader's Digest ("Is War With Russia Inevitable?"), Mr. Kennan closed his analysis with four essentials necessary for our national security. These four fit in near total exactness with the essentials listed in the Advisory Commission Report. (Secretary of State Acheson reiterated this thesis in his address, "Total Diplomacy," February 1949)

A PROGRAM FOR NATIONAL SECURITY

Foreword

The members of this Commission

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

have been asked by the President to determine whether the security of this Nation and the preservation of world peace require the establishment of a system of universal training. The President has further charged this Commission with the responsibility of recommending, if such a system is deemed necessary, how it can be carried out to give the country the largest measure of protection; make maximum allowance for the spiritual, mental, and physical development of the young men in training; and keep costs at the lowest level consistent with attainment of its security goal.

The Commission has approached its task with a recognition of the fateful character of the problem before it. Its members started with a considerable disparity of viewpoint on the degree to which universal military training would contribute to our own readiness for war or to the advancement of world amity. The one point on which there was complete agreement was that the Commission should undertake its inquiry with open minds and in an atmosphere wholly free of outside interference or influence from any source, public or private, civilian or military.

We are pleased to report that this aim of the Commission has been carried out successfully. The conclusions contained in this report represent the free, reasoned, and unanimous judgment of the members based on nearly 6 months of intensive study. In the course of our investigation, we heard approximately 200 witnesses representing every shade and variety of opinion. These included the men directly charged with the conduct of our military and foreign affairs, as well as those who have been most active in opposing military training and the foreign policies of our Government. We have studied previous testimony and published opinions, as well as voluminous correspondence, and have held scores of personal interviews in many parts of the country.

We have given close attention to the objections that have been raised to universal military training by those who feel it has no important place in a sound program of national defense, by those who fear it will inflict lasting damage on the lives of American youth, and by those who believe that it will be harmful to the continued operation of the United Nations. We have taken careful stock of the dangers now confronting this country and the United Nations. We have sought from leaders in the field of science and of military tactics the most expert guidance on the probable character of future warfare.

The Commission considered first whether a program of universal training could be supported solely on the basis of its possible contribution to the nation's health, education, and spiritual development. It has been our judgment that, if these were the only benefits to be derived from such a program, they could be secured more surely and more appropriately through a strengthening of existing public and private agencies in these fields rather than by a separate system of universal training.

The only basis on which universal training should be accepted, in our opinion, is a demonstration that it is needed to insure our safety in a world in which peace is not yet secure. We are convinced that such training is an essential element in an integrated program of national security designed to protect the United Stated against possible aggression, to perpetuate the freedoms for which millions shed their blood, and to hasten the advent of universal

1954

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

disarmament and peace through the United Nations. While as we hereinafter point out, universal training is not our first line of defense, we are convinced that without universal training the Nation's defense would be incomplete and inadequate.

In arriving at the conclusion that universal military training is a matter of urgent military necessity and in recommending that it be approved by the Congress and the people, we have attempted to lay down a program through which the military objectives of the training can be achieved under circumstances that will strengthen the spirit of democracy and prove of lasting value from a physical, mental, and moral standpoint to the youths in training. Our chief aim, however, and our principal justification for the program are military security and peace for ourselves and for the rest of the world. The other benefits which we envisage from such a program are by-products of a project which is made necessary by the state of the world today.

THE WORLD SITUATION AND THE PRESERVATION OF PEACE

At the root of all the Commission's thinking is the conviction that the only real security for this country or any other country lies in the abolition of war through the establishment of the reign of law among nations. The United Nations is the embodiment of our hopes for a durable peace based on justice and cooperation, rather than violence and death. The United States has committed itself to a position of leadership in building the United Nations into an effective instrument for banishing the use of armed might in the settlement of international conflicts.

Unfortunately, at the very time that we have assumed this commitment and before we have achieved it, we have allowed our military strength to fall away from us. The Army that fought with such power against Germany and Japan has been dismantled. Virtually all of what is left is assigned to occupation duty in the defeated countries. At a time when war can strike without warning and with devasting force, our Ground Forces have only 2 1/3 full combat divisions available for duty. Our air and sea strength is somewhat more formidable, but it is dwindling so rapidly that it cannot long be considered a shield against possible attack.

For a few years our monopoly of the atomic bomb and the availability in our civilian population of millions of battle-tested veterans of World War II may serve as insurance against a direct assault on the American homeland. But the precipitate drop in our state of military readiness will have the inevitable effect of encouraging those to whom weakness on the part of the peace-loving nations is a passport to aggression.

By the same token, the lands that share our democratic ideals but lack our resources of men and material will lose faith in our will or our ability to make real the principles for which we stand. Their industries demolished and their people demoralized, they will succumb the more readily to the blandishments or the threats of competing ideologies. The mantle of totalitarianism will spread over still larger sections of the earth, increasing the peril to us and narrowing the company of those on whose aid we can count in the search for lasting peace.

AIR FORCE LETTER)
NO. 205-25)

DEPARTMENT OF THE AIR FORCE
WASHINGTON, 30 MARCH 1949

SECURITY

Disclosure of Classified Information to Reserve Forces Personnel

(Effective until 30 September 1950 unless sooner rescinded or superseded.)

	Paragraph
Purpose	1
Scope	2
Policy	3
Investigation and Clearance	4
Residents of Foreign Countries and Foreign Nationals	5
Requirements	6

1. Purpose. To provide uniformity, this Letter outlines the policy of the Air Force with respect to the dissemination of classified military information to Reserve Forces personnel.

2. Scope. This Letter applies to the Air Force Reserve and the Air National Guard, and in addition, its provisions will be followed in connection with activities concerning the Air Reserve Officers' Training Corps and the Senior Division of the Civil Air Patrol. This Letter does not apply, however, to personnel on extended active duty.

3. Policy. In compliance with the provisions of AFR 205-1 regarding security of military information, Reserve Forces personnel may be entrusted with classified information as follows:

a. RESTRICTED information may be disseminated for official military purposes to any Reserve Forces personnel.

b. Except as authorized in c below, information classified no higher than CONFIDENTIAL may be disclosed to Reserve Forces personnel not on active duty who are actively participating in official training activities, provided that possession of the information is essential to the training course or program.

c. SECRET information may be disclosed to Reserve Forces personnel on active duty for training purposes and personnel not on active duty who have a mobilization assignment, provided that possession of the information is necessary in the performance of official assigned duties.

d. TOP SECRET material will not be used for training purposes in connection with Reserve Forces training programs. As authorized by paragraph 7, AFR 205-1, 14 March 1949, however, individuals serving on short periods of active duty whose assignments require it may be given access to the TOP SECRET information essential for the performance of their assigned duties.

e. Documents containing information classified higher than RESTRICTED will not be disseminated for retention by individuals. Such documents will be stored in military files only.

f. Reserve Forces personnel not on active duty who receive classified information will be informed that the information affects the National defense of the United States within the meaning of the Espionage Laws and that its revelation or transmission to an unauthorized person is prohibited.

g. Upon termination of active duty training, personnel will be briefed on the necessity for maintaining security of their professional knowledge while on inactive status.

4. Investigation and Clearance. Commanders concerned are responsible for requesting personnel security investigations and clearing personnel referred to in this Letter whenever required or necessary in accordance with separate Regulations.

5. Residents of Foreign Countries and Foreign Nationals. The provisions of AFL 182-4 and 8f, AFR 205-1, 14 March 1949, will be observed regarding dissemination of military information to persons residing in foreign countries, or to foreign nationals as defined in paragraph 2i, AFR 205-1.

6. Requirements. Although it is the desire of the Air Force to make available to Reserve Forces personnel such classified information as is required for training purposes within established training programs and courses, it is of primary concern that no breach of security will result from this policy. Commanders concerned will review continuously all classified material required by or of direct value to Reserve Forces activities, and whenever appropriate, will initiate down-grading action thereon in accordance with paragraph 27, AFR 205-1, 14 March 1949.

BY ORDER OF THE SECRETARY OF THE AIR FORCE:

- - - - -

*This Letter supersedes AFL 205-25 (formerly 46-7), 31 March 1948.
This Letter has been coordinated with and approved by the Chief, National Guard Bureau, as being applicable to the Air National Guard.

THE COMMANDING GENERAL
CONTINENTAL AIR COMMAND
MITCHEL AIR FORCE BASE, NEW YORK

The information herein was compiled by personnel assigned to the Office of the Director of Intelligence, Headquarters, Tactical Air Command, with the aim of presenting in one volume a study on the organization, tactics and equipment of the Armed Forces of the Union of Soviet Socialist Republics. This information has, heretofore, been available only in many publications.

The sources of the information include the general publications of the Intelligence Division, General Staff, United States Army; the Director of Intelligence, Headquarters, United States Air Force; the Central Intelligence Agency; and the Intelligence Center, Atlantic Command and United States Atlantic Fleet. In addition, assistance was obtained by personal contact with the Intelligence personnel of the Army Field Forces, Fort Monroe, Virginia, and the Atlantic Command and United States Atlantic Fleet at Norfolk, Virginia.

In order that this volume may continue to be both comprehensive and up-to-date, supplements containing additions and corrections will be published. These supplements will be published in uniformity with this original volume so that they can be bound into the same cover.

Every officer should not only have a ready comprehension of international issues but he should also keep himself fully informed on all current tactical and technical trends and developments. This volume on tactical and technical trends and developments is far from definitive, and represents only an introduction to the general field. It must be supplemented by appropriate Intelligence appraisals, by newspaper and periodical reports, and by relevant military literature.

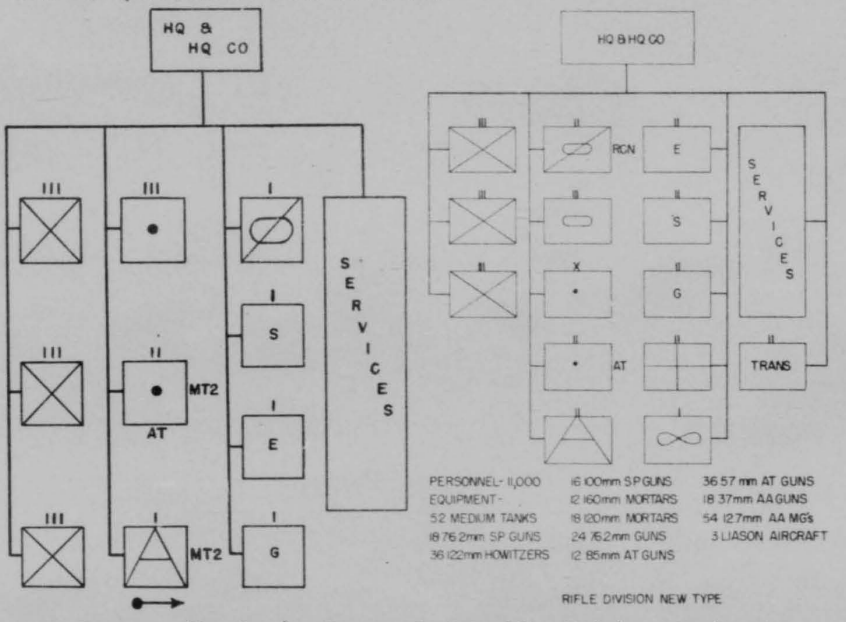
Rifle Division (World War II) - The wartime division, with but little artillery, and that chiefly horse-drawn, was light and maneuverable, but it lacked strategic mobility and organic support. For offensive operations it served usually as the basis of specially tailored infantry-tank-artillery assault groups. For pursuit operations the rifle divisions was sometimes temporarily motorized for support of large armored units in rapid advances.

It is not unlikely that all Soviet rifle divisions will eventually conform to the new division T/O&E. Some are organized as mountain units, and a number may retain their horse-drawn transportation, suitable for operations in roadless terrain.



RIFLE DIVISION NEW TYPE

Rifle Division (New Type) - The new Soviet rifle division, developed since VJ-day, has more offensive shocking-power on a man-for-man basis that the U.S. infantry division, although it is inferior to the latter in staying power. The Soviets, with over 100 rifle divisions in peacetime, need not plane for prolonged commitment of their divisions; in World War II they employed rifle divisions on a rotational basis in the line. Since VJ-day, the Soviet High Command has strengthened the rifle division organization by increasing its mobility, logistical endurance, and firepower.

The new-type Soviet rifle division is a well-balanced unit with formidable firepower.

THIS PAGE IS UNCLASSIFIED

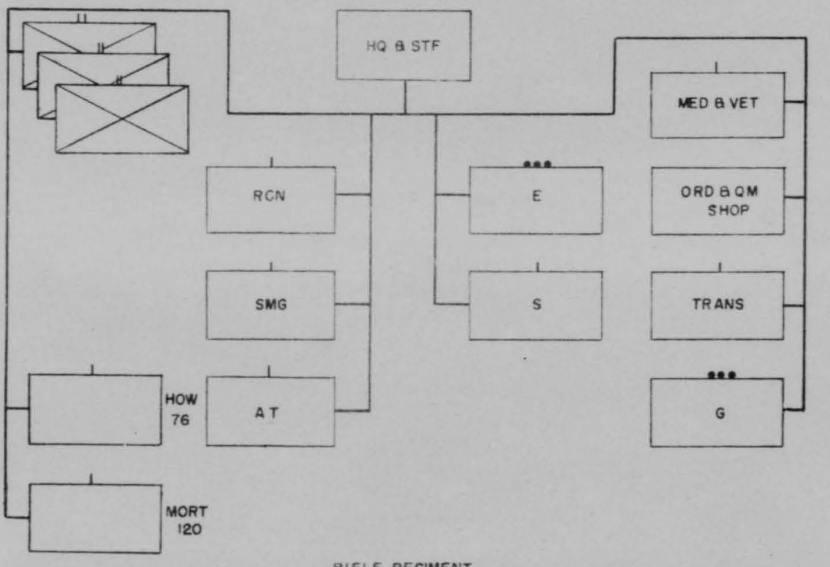
Rifle Regiment - The Soviet rifle regiment is an organization which contains the arms and minimum services necessary for the execution of independent combat missions. In contrast with 3,257 officers and enlisted men of the U.S. infantry regiment, it appears small. The difference is due mainly to smaller weapons, crews and service elements. The Soviet rifle regiment is stronger than the U.S. infantry regiment in automatic weapons, especially submachine guns, and in medium and heavy mortars. But it is weaker in regimental artillery and anti-tank guns. Outstanding feature of the organization of the rifle regiment is the submachine gun company of 100 men, all armed with submachine guns.

With the exception of heavy mortars and signal equipment, which are motorized, all of the regimental weapons and transport are horse-drawn. The regiment is free to maneuver in all kinds of weather and terrain. It is not road-bound. The regiment is, however, incapable of extended independent combat, because the supply and maintenance capabilities of its organic transport are low. Even moderate casualties greatly reduce its effectiveness. The regiment is easily maneuverable. It requires only three 50-car trains for movement by rail.

The Guards Rifle Regiment differs from the standard rifle regiment in that it is upgraded in personnel, and made stronger in light and heavy automatic weapons. A Guards Rifle Regiment is able to put more men in the forward line, and is capable of more extended action than is the standard rifle regiment.



RIFLE REGIMENT

1973

THIS PAGE IS UNCLASSIFIED

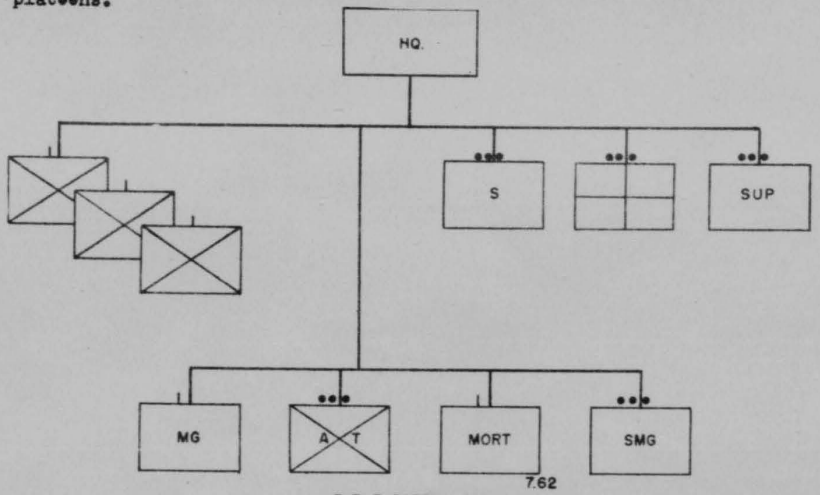
Rifle Battalion - Basic organizational element of the infantry arm is the rifle battalion. The battalion is the lowest administrative and housekeeping unit of the infantry arm maintaining a kitchen, a repair shop, a medical unit, and a pharmacy for its subordinate units. With its light transport, organic supporting mortars, and light artillery, it is well suited for outflanking and infiltrating tactics in any terrain.

In comparison with the U.S. infantry battalion, the Soviet rifle battalion is weaker in personnel and weapons, except light automatic weapons and medium mortars. The outstanding feature of the armament of the rifle battalion is its large number of submachine guns.

Supply and maintenance capabilities of the rifle battalion are small. For more than a day of light combat it must be assisted by regimental or divisional services. A rifle battalion can be easily moved.

Two variations of the rifle battalion - - the motorized rifle battalion and the motorized submachine gun battalion - - constitute the infantry element of the motorized and the tank brigade respectively. The motorized rifle battalion differs from the standard battalion in that it has additional antitank rifle, antitank gun, and submachine gun platoons. It has six instead of nine 82mm mortars. The motorized submachine gun battalion, a part of the tank brigade, is smaller than the standard rifle battalion. It lacks the machine gun company, and has six instead of nine 82mm mortars. But, like the motorized rifle battalion, it has additional antitank rifle and antitank gun platoons.



RIFLE BATTALION

1974

THIS PAGE IS UNCLASSIFIED

Rifle Company - The rifle company is stripped of all personnel not immediately essential to the combat mission. Company headquarters consists of the company commander, first sergeant, cooks, and first-aid man. Each of the three 30-man rifle platoons is organized into three squads, with three men in platoon headquarters.

The squad consists of nine men, although its T/O strength has varied in the last eight years from 8 to 12. Its fire base is the DP light machine gun - - a weapon generally similar to the Browning Automatic Rifle - - or, in some cases, the Company Light Machine Gun, a newer and more effective weapon. Five riflemen equipped with bolt action rifles or carbines complement the machine gun firepower. Despite their predilection for the submachine gun, the Soviets emphasize the value of individual armed fire, and one rifleman in each squad is usually qualified as a sniper and is issued a rifle with telescopic sight. A postwar innovation is the panzerfaust which is now allotted to each squad. The panzerfaust is a recoilless grenade-launcher, firing a hollow-charge projectile against tanks.

PISTOLS AND REVOLVERS

General - As in other armies these weapons are of minor importance in the Soviet Army. They are issued to tank crews, officers, etc., for personal defense, but have been replaced by submachine guns to a great extent for combat use.

The principal defect of the Soviet hand guns is their small caliber (7.62mm or .30 cal). This limits bullet weight, which in turn results in insufficient shocking power in spite of high velocity.

Possible development may be a pistol with selective full and semi-automatic fire, shoulder stock holster and a large caliber.

Characteristics

1. Nagant M1895 Revolver....At left.
Caliber.....7.62mm (.30 cal)
Effective Range..... 50 yards
Capacity of Feed Device.....7 rds in cylinder
Practical Rate of Fire.....7 rds in 15-20 seconds

Remarks Obsolescent, but still in use. This revolver is hand-operated. There are single and double action models.

2. Tokarev "TT 1930" Automatic Pistol.....At right
Calibre.....7.62mm (.30 cal.)
Effective Range.....50 yards
Capacity of Feed Device.....8 rds in clip magazine
Practical Rate of Fire.....8 rds in 10-15 seconds

Remarks -Also has been designated as TT 1933. This recoil operated semiautomatic pistol is of Colt-Browning design and is a simplified version of the U. S. pistol .45 cal. M1911 or M1911A1.

1976

THIS PAGE IS UNCLASSIFIED

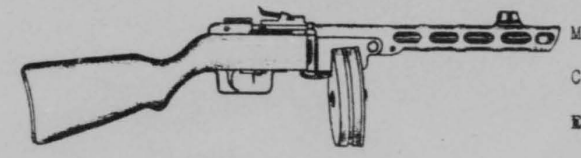
SUBMACHINE GUNS

General - The Soviet Army has developed four submachine guns, three of which have been developed since 1940. Two of these, Model 1934/38 and "Degtyarev" PPD 1940 are obsolete. There is wide distribution throughout the Army of submachine guns.

There are comparatively few basic changes to be expected in Soviet submachine guns except for the possible adoption of a more powerful cartridge in a weapon along the lines of the German MP 44 automatic carbine.

Characteristics



1. "Shpagin" PPSH M1941.....At left

Calibre.....7.62mm (.30 cal.)
Effective Range..... 325 yards

7.62 mm "SHPAGIN" PPSH M1941 SUBMACHINE GUN

Capacity of Feed - Device.....71 rd in Drum magazine; 35 rd in clip magazine
Practical Rate of Fire (RPM).....

Semiauto - 30
Short Bursts- 70
Long Bursts- 100

Remarks - Believed to be limited standard, but still the model in widest use. Has wooden stock. Has selective auto and semi-auto fire.

2. "Sudarev" PPS - M1943.....At right
Calibre..7.62mm(.30 cal)
Effective Range.....
Short bursts-220 yards
Long bursts -110 yards
Capacity of Feed Device- 35 rd in box magazine
Practical Rate of Fire.. (RPM).....100

Remarks - There was great need for a submachine gun which could be easily mass-produced; the result was the PPS 1943. This weapon fires a 7.62mm (.30 cal.) high-velocity, light weight ball round, and an armor-piercing incendiary round for use against lightly armored targets. Believed to be the current standard submachine gun. It is distinguished by the folding skeleton metal stock.

CARBINES AND RIFLES - CHARACTERISTICS

7.62mm M1938 Carbine

Calibre.....7.62mm (.30 cal.)
Effective Range.....Up to 440 yards
Capacity of Feed Device.....5 rds clip-fed in magazine
Practical Rate of Fire (RPM)..10

Remarks - Believed limited standard. Has no provision for bayonet. Believed being converted to M1944 carbine. Is a shoulder version of the M1891/30 rifle.

ILLUSTRATION NOT AVAILABLE

ILLUSTRATION NOT AVAILABLE

7.62mm M1944 Carbine

Calibre.....7.62mm (.30 cal.)
Effective Range.....Up to 440 yards
Capacity of Feed Device.....5 rds clip fed in magazine
Practical Rate of Fire (RPM)..10

Remarks - The standard shoulder arm for troops whose duty does not require a rifle or submachine gun. Differs from the M1938 carbine only in the permanently attached, folding bayonet.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

M1891/30 Mossin-Nagent Rifle

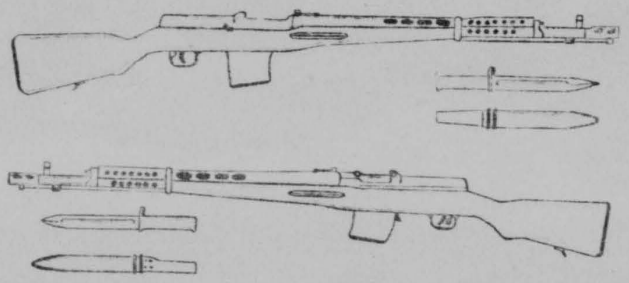
Calibre.....7.62mm (.30 cal.)
Effective Range.....Up to 440 yards-with telescopic sight, approximately 880 yards
Capacity of Feed Device.....5 rds clip-fed in magazine
Practical Rate of Fire (RPM)..10

Remarks - The basic rifle of the Soviet Infantry, the manually operated, bolt action M1891/30 and improved later versions have been the mainstay of their infantry since 1891. Sniper versions are in the service. The earlier sniper versions had a 4-power telescopic sight, but later versions have a simpler 3.5-power telescopic sight on a mount fastened to a base on the left side of the receiver. A silencer used in conjunction with ball ammunition loaded below the velocity of sound was used in partisan operations during World War II. The M1891/30 has given satisfaction except for its slow rate of fire (10 rpm) and awkward length.

There are two carbine versions of the bolt action M1891/30 rifle. These differ only in that the latter-M1944-version has a permanently attached folding bayonet.

Tokarev Semi-Automatic Rifle (SVT) M1940

Calibre.....7.62mm (.30 cal)



Remarks -Currently in service in limited numbers in the infantry, this is a gas-operated, air cooled magazine fed, shoulder weapon. Some are capable of fire on full automatic, as a light anti-aircraft weapon,using a 15-round magazine instead of the regular 10-round magazine. Workmanship is good but lacks ruggedness.

Effective rates of fire are considered to be 20-25 rounds per minute in semi-automatic fire, and 70-80 rounds per minute when the rifle is fired on full automatic.

The weapon develops a muzzle velocity of 2,720 ft/sec when M1908 ball ammunition is used. Maximum effective range is considered to be 440 yards against ground targets and 500 yards against strafing planes. Over-all length is 48.2 inches. With the inclusion of a

1979

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

3.5 X telescope that is easily mounted with a horseshoe type mount, the rifle may be used for sniping.

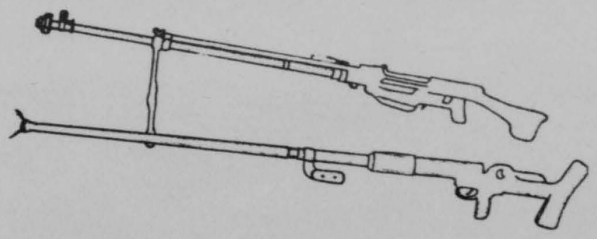
A six baffle combination muzzle brake compensator is permanently mounted on the muzzle. This helps keep the muzzle down and lessens the recoil, but the back blast from the gases produces a very bad effect on the firer in a short time. It is reported that this weapon is not well liked in the infantry, despite its sufficiently rapid rate of fire, because it is regarded as very complicated and sensitive.

This weapon employs a fluted chamber throat, which tends to equalize the forces on the inside of the cartridge, thus reducing the adhesion of the cartridge case to the chamber walls. The cartridge, then being less tight in the chamber, may be extracted with less effort and in smoother action. Lighter extractors may be used, and broken extractors and jammed empty cartridge cases are less frequent.

Antitank Rifles - General

The Soviet Army is equipped with two calibre .57 antitank rifles; one is single-shot, bolt action, and the other is gas-operated, semi-automatic in action. Both weapons were standardized early in World War II when armored vehicles carried much less thicknesses of armor than were used at later periods. Accordingly, these weapons have lost a good measure of their effectiveness. Although still effective against armored cars, half-tracks, and light tanks, they are relatively ineffective against modern medium and heavy tanks. It is believed that these weapons are not limited standard and indications are that they are being replaced by a recoilless antitank weapon of the German Panzerfaust type.

The German Panzerfaust is a one-man recoilless grenade launcher. Panzerfaust-type weapons do not possess either the range or the accuracy of the United States recoilless or rocket launchers. However, for close-in fighting at a range of 50 yards or less, they are extremely effective and, once a hit is obtained, able to penetrate any modern armor.



1. 14.5mm Simonov PTRS-1941 Antitank Rifle - Top left.
2. 14.5mm Degtyarev PTRD-1941 Anti-tank Rifle Top bottom.

Calibre...1.& 2. 14.5mm

Remarks - The PTRS is a gas-operated, semi-automatic rifle with a 5 rd clip magazine, while the PTRD is a manually operated bolt-action, single-shot rifle. The BS-41 round, having a tungsten-carbide core, is the most effective ammunition for use with these rifles. The BS-41 round will penetrate 1.18 inch of armor at 110 yards; 1.08 inch at 330 yards; .98 inch at 550 yards, at 30 degrees angle of impact.

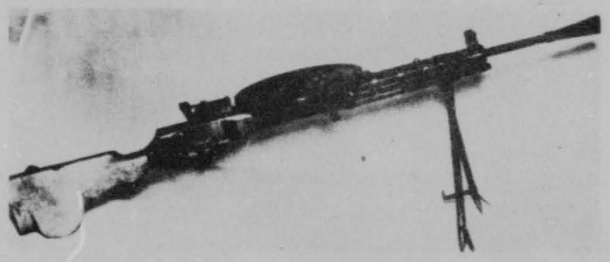
MACHINE GUNS

General - The Soviet machine guns in current use are in the majority of cases designs developed and standardized prior to World War II.

However, after fighting a major war, the Soviet Army has become aware that its combat infantrymen have worthwhile ideas on the everyday weapons with which they fought, and the Soviet Ordnance Department has taken action on the criticisms of the "DP" Light Machine Gun, the basic light machine gun of the Soviets infantry throughout World War II. As a result, the M1946, Company Light Machine Gun, technically far superior to the DP, has been developed.

Characteristics

1. 7.62mm Model DP (Degtyarev)



Calibre.....7.62mm (.30 cal)
Effective Range.....Ground - 880 yards AA - 550
Capacity of Feed Device...47 rd in drum magazine
Rate of Fire (RPM).....80

Remarks - Developed in 1926, the Model DP Light Machine Gun proved to be the work-horse of the Soviet Infantryman until VJ-day. The "DP" is a light, gas-operated, air-cooled, magazine fed, and biped mouthed machine gun. It is basically of very simple design and easily manufactured, and, besides the basic version, variations of the "DP" came into service as standard tank and aircraft flexible machine guns well before World War II.

After their experience during the Spanish Civil War of 1936-38, the Soviets entered the war with this as their standard weapon, knowing that: (1) the drum magazine caused numerous stoppages; (2) the driving spring, positioned around the gas pistol in a cylinder underneath the barrel, gave trouble when the gun became heated; (3) the weapon had a very marked comparable effective rate of fire. However, production was more important than accomplishing major modification. A few minor modifications that would not materially affect production were made during the war.

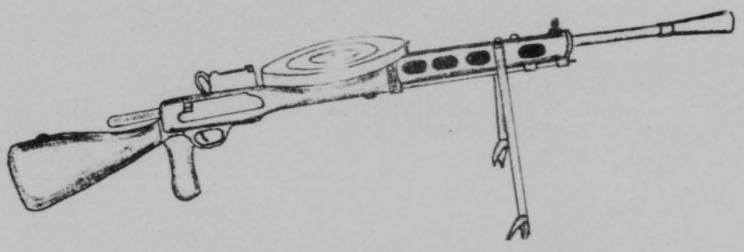
THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

2. 7.62mm Model DPM - Company Light Machine Gun



Calibre.....7.62mm (.30 cal.)
Effective Range.....Ground - 880 yards, AA - 550 yards
Capacity of Feed Device...47 rd in drum magazine
Rate of Fire (RPM).....80

Remarks - Late in 1944, the Soviets redesigned the "DP" to eliminate some of the faults made apparent by three years of combat use. The most important change made at this time was to remove the driving spring from its position around the gas piston- where it was exposed to the heat of the propellant gases and the hot barrel - to a position in the rear of the receiver. Some of these redesigned "DP's", known as the "DPM" (Degtyarev Infantry, Modernized), were in service at the close of World War II. Some "DP's" also had a modified flash-hider added which served as a muzzle brake and lessened the dispersion of fire inherent in a light automatic weapon fired from a bipod mount.

3. 7.62mm Model DT - Tank Machine Gun

Calibre.....7.62mm (.30 cal)
Effective Range.....875 yards from halted vehicle
330 yards from moving vehicle
Capacity of Feed Device...60 rd in drum magazine
Rate of Fire (RPM).....100 (estimated)

Remarks - This is a tank-mounted version of the "DP". It is used as a coaxial and hull gun in armored combat vehicles. It has a pantograph, skeleton stock and aperture sights. The biped mount is carried in the vehicle for emergency off-the-vehicle use.

THIS PAGE IS DECLASSIFIED IAW EO 13526

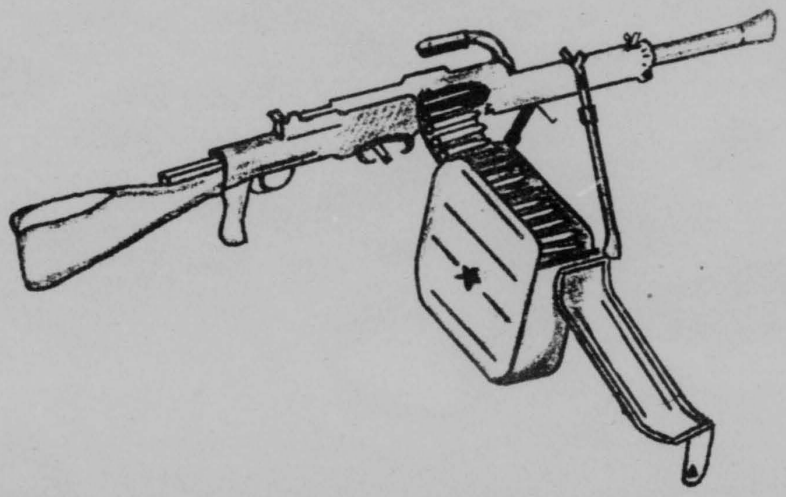
THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

4. 7.62mm Model 1946 - Company Light Machine Gun



Caliber.....7.62mm - Model 1946 (.30 cal.)
Effective Range.....1,100 yards; most effective up to 668 yards

Remarks - By 1947, development had standardized the 7.62mm Model 1946 Company Light Machine Gun. This gun is basically the "DPM" with extensive modifications. The most important change provides for a belt-fed mechanism which handles the 50-round sections of metallic link belts used in the 7.62mm M1943 Coryunov Heavy Machine Gun. Those, like the German link belts, are capable of being joined to give any capacity desired, but are usually packed five sections (250 rounds) to a belt box. This belt-fed mechanism is made detachable so that the 47-round drum magazine may be used.

Since the new weapon has a higher (250 rpm) effective rate of fire than its predecessor, the DP/DPM, with its 80 rpm, it has been necessary to increase the barrel weight. The barrel lock has been improved so that barrel change is accomplished much faster than in the DP/DPM, and the weak bipod of the older guns has been strengthened.

The M1946 weighs 5.51 pounds more than the basic "DP", but this added weight is negated by the fact that it weighs 22 pounds less than the "DP" when 500 rounds of ammunition are computed in the total weight, owing to the lesser weight of the belts compared to that of the drum magazines.

1985

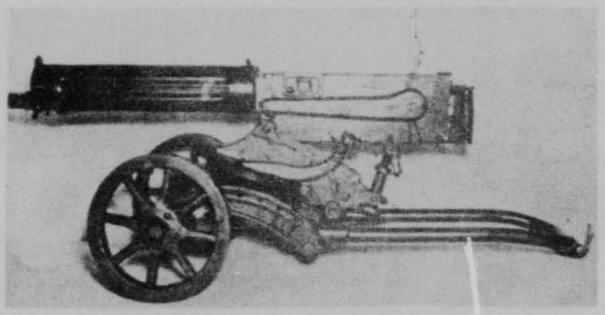
THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

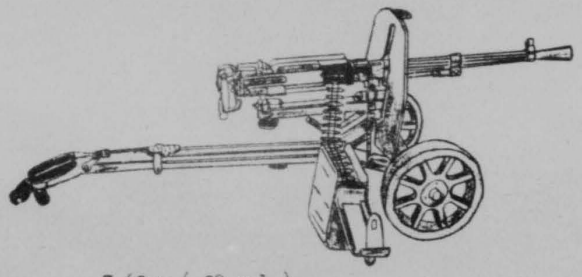
5. 7.62mm M1910 Maxim - Heavy Machine Gun



Caliber.....7.62mm (.30 cal.)
Effective Range.....Ground-1,650 yards,AA-1,100 yards
Capacity of Feed Device.....250 rd in fabric belt
Practical Rate of Fire (RPM)...250 - 300

Remarks - This is a heavy, clumsy, but reliable water-cooled gun. It is now apparently limited standard and probably being replaced by the Guryonov M1943 or an improvised version of the Guryonov. Used as light AA on single, dual and quad AA mounts. Well liked in the Soviet Army. M1908 light ball ammunition giving maximum range of 3,300 yards can be fired although M1930 heavy ball is the present standard.

6. 7.62mm M1943 - Guryonov - Heavy Machine Gun



Caliber.....7.62mm (.30 cal.)
Effective Range....1,100 yards - ground
550 yards - AA
1,100 yards - AA (with special sight)

Remarks - This gun or an improvised version believed to be replacing the M1910 Maxim heavy machine gun. Mount inverts for AA fire. M1908 light ball ammunition giving maximum range of 3,300 yards can be fired although M1930 heavy ball is the present standard.

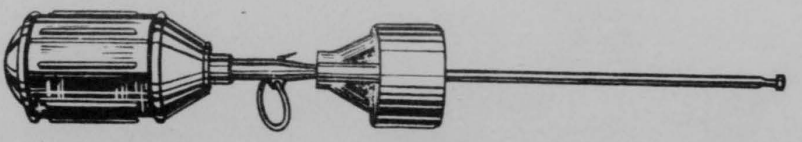
GRENADES

General - Soviet hand grenades include offensive, combination offensive and defensive, defensive, shaped-charge antitank, and chemical types.

In general, Soviet grenades are simple in operation but somewhat complicated in design. Hand antitank grenades, especially of the shaped-charge variety, are emphasized. The absence of a known HE rifle grenade during World War II may be explained by the use of the 50mm light mortar. Since the 50mm mortars are believed to be obselescent, an HE rifle grenade may be expected to come into service. Due to Soviet emphasis during World War II on close combat antitank work, it is to be expected that development of hand shaped-charge antitank grenades will continue in conjunction with recoilless weapons firing shaped-charge antitank projectiles.

Characteristics

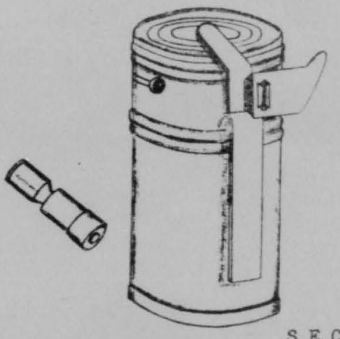
1. VPG-S 1941 HEAT Rifle Grenade



Average Range - 55-85 yards.

Remarks - Present status not known but used in World War II; utilizes shaped charge principle, penetrates 1.18 inches of armor at 60°; no launcher used as grenade is of the rodded type in which the rod is inserted in the rifle barrel and a blank cartridge used.

2. RG-42 Offensive Hand Grenade (M 1942 HE)



Average Range.....35-45 yards.

Effective Radius of Fragmentation.....17-25 yards.

Remarks - Believed standard, depends on light of fragmentation.

1985

MORTARS

GENERAL

On the whole, Red Army mortar technique is very similar to that of the U. S. Army. However, the Soviets seem to place greater emphasis on the role of the mortar as a support weapon. This emphasis becomes apparent in the greater stress laid on officer supervision and centralized control of mortar units than will be found in equivalent units of the U.S.; and also in the greater number of medium and heavy mortars found in a Soviet rifle division. The resulting striking power of a Soviet rifle division by weight of projectile is two and one-half times that of an American infantry division.

TACTICAL EMPLOYMENT

The fundamental principle of mortar employment in the Soviet Army is the use of massed mortar fire as an independent striking weapon. This is achieved by combining mortar units under one commander. In operation, requirements are set by the infantry commander, while technical control and coordination are the responsibility of the artillery commander. Constant coordination and liaison between mortar units, artillery command, and the rifle units is a strict rule. The result is a closely knit fire plan wherein a single system of terrain reference is maintained by all troops. This, in turn, facilitates requests for, and delivery of, fire support.

Fundamentally, mortar fire, like field artillery, is used to neutralize and destroy the enemy system of fire throughout all operational phases, thus enabling Soviet infantry to encircle and destroy enemy personnel.

DEVELOPMENT AND TRENDS

The characteristics of modern Soviet mortars, brought about as a result of World War II experience, are simplicity of design, light weight, and high mobility. Up until now, emphasis has been placed on fire power rather than accuracy. However, the Soviets have now developed their 160mm mortar, and, as this appears to be the optimum for a field mortar as to caliber and weight, they are likely now to concentrate on the improvement of accuracy and greater mobility.

In this regard, it is expected that high priority will be allotted to the development of better mortar fire control, ammunition, and means of more rapidly concentrating the fire of massed units.

A possible development is that of a mortar that would be readily convertible to a recoilless weapon for flat trajectory use. Another is a self-propelled heavy mortar or multiple mortar.

THIS PAGE IS UNCLASSIFIED

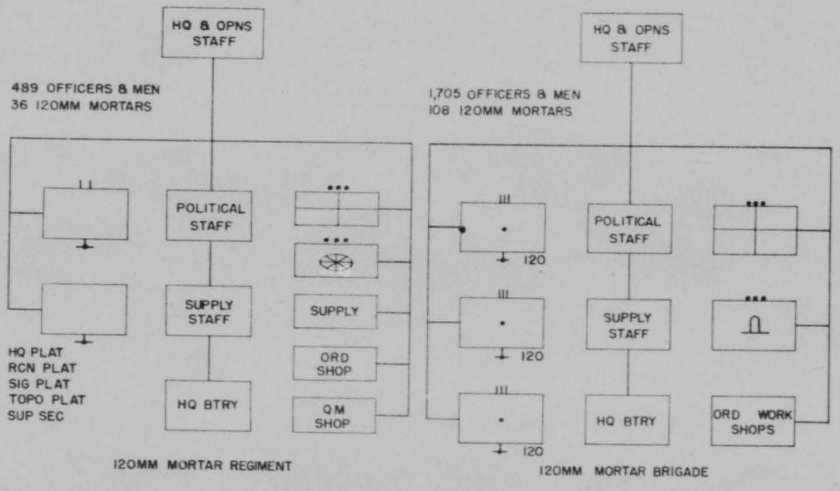
ORGANIZATION

120mm Mortar Brigade

Every artillery division has a mortar brigade. Mortar brigades, however, also may be independent. A mortar brigade has good tactical and strategic mobility. Primary missions of the mortar brigade include: Destruction of personnel in the open and in light shelters; destruction of light field fortifications and wire barriers; destruction or neutralization of artillery, mortar, and infantry firing positions; accompanying and defensive barrages and concentrations; and smoke screens. A heavy mortar brigade is especially useful in woods and swamps in direct support of infantry or cavalry.



120mm Mortar Regiment

A heavy mortar regiment forms a part of a mortar brigade, or it may be independent. It is used for destruction of personnel and materiel in open positions and in open trenches, for destruction of wire entanglements, neutralization of machine guns and mortars, and for the establishment of stationary and moving barrages. During artillery preparation for an offensive operation, the mortar regiment is often reinforced by a 122mm howitzer regiment to form a counter-mortar groupment.

THIS PAGE IS UNCLASSIFIED

82mm M1937 Battalion Mortar

Caliber.....82mm
Maximum range.....3,325 yards
Maximum rate of fire (rpm).....25
Elevation.....45° to 85°

Remarks - Each battalion 82mm mortar company, with nine pieces, may fire in support of its own rifle battalion. On defense, or static situation, it is normal to combine the three medium mortar companies of a rifle regiment into a provisional battalion commanded by the regimental heavy mortar battery commander who operates jointly with the three mortar companies. This provisional mortar battalion establishes a fire direction center with wire communication to observation posts. Parellel and unit observation posts are numerous in this set-up.

82mm M1941 Battalion Mortar, and 82mm M1943 Battalion Mortar

Caliber.....82mm
Maximum Range.....3,325 yards
Maximum Rate of Fire (rpm).....25
Elevation.....45° to 85°

Remarks - There are only minor differences, not affecting performance, between the two models. The M1943 is believed to be the current standard weapon with the M1941 being modified to M1943. Has wheeled mount and can be hand-thrown by two men.

1996

107mm M1943 Mountain Mortar

Caliber.....107mm

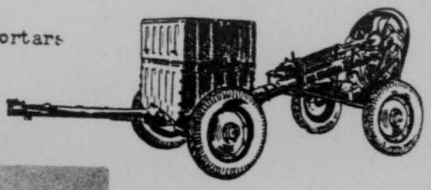
Maximum Range,.....6,900 yards

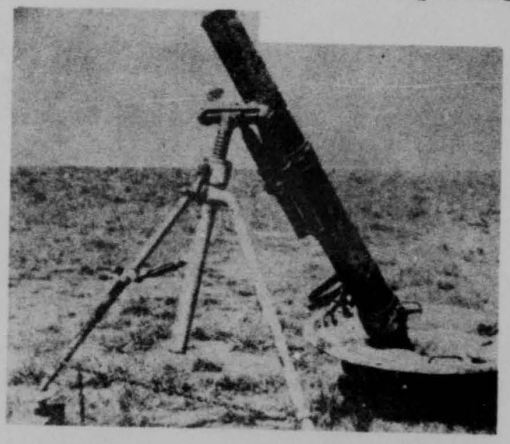
Maximum Rate of Fire (rpm).....15

Elevation.....45° to 80°

Remarks - This weapon was in use in mountain units during World War II. Not known whether it is still standard. This weapon fires gas and smoke rounds. Mortar, limber, and caisson drawn by four horses or packed on nine animals.

120mm M1938 and M1943 Regimental Mortars





Caliber.....120mm

Maximum Range.....
.....6,240 yards.

Maximum Rate of Fire(rpm)
.....12.

Elevation.....45°to 80°

Remarks - The Soviet standard heavy mortar is the 120mm, there being seven of them in the regimental mortar battery. There is no equivalent organization or weapon in the U. S. Army infantry regiment.

The M1938 is believed limited standard and the M1943 standard. There is no performance difference between the two models.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

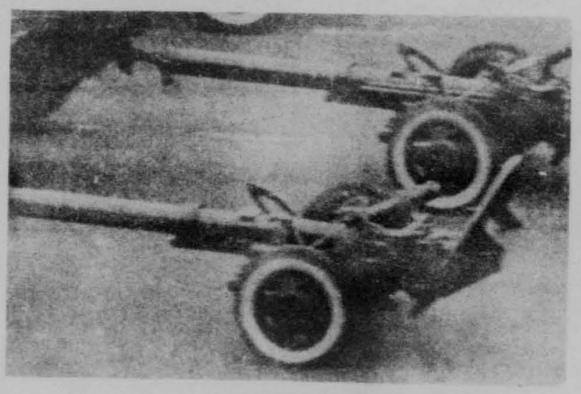
Mortar, limber, and caisson are horse or truck drawn, also sometimes carried on trucks or packed on animals.

This mortar so impressed the Germans that they not only used captured mortars of the type but proceeded to manufacture a very close copy which they used extensively.

The 120mm along with the 160mm are actually regarded as artillery according to Soviet concepts and, during World War II, were massed in regiments and brigades for barrage fire against area targets.

The 120mm mortars are characterized by high rate of fire, great maneuverability and good radius of burst.

160mm Model 1943 Mortar



Caliber.....160mm

Maximum Range.....5,500 yards

Maximum Rate of Fire (rpm)...3

Remarks - Latest known mortar, believed standard. Method of loading not certain. Mount believed integral with limber used to transport mortar; truck drawn. This mortar and the 120mm are regarded as artillery by the Soviets and, during World War II, were massed in regiments and brigades for barrage fire against area targets. The 160mm appears to be the optimum for a field mortar as to caliber and weight.

ARTILLERY

GENERAL

The importance of massed supporting fire, both in the initial and subsequent phases of armored operations, is stressed by the Soviet Army in its employment of large balanced armored forces in independent operations.

One notable difference from U. S. practice is the Soviet use of large quantities of heavy mortars, rockets, and towed tank-destroyer artillery. In addition, the Soviets employ heavy caliber self-propelled artillery both for centralized and decentralized assault-gun type support.

The Soviets employ six main types of ammunition: HE, for general use; AP (solid) and sub-caliber, arrow type for penetration of armor; concrete piercing (HEAP), against concrete and armor; shrapnel against personnel up to three kilometers; incendiary, and smoke.

NOTE: Sub-caliber ammunition should not be confused with that used in the familiar U. S. Army materiel, which consists of a smaller gun mounted either inside or on top of the tube of a larger gun for the purpose of firing the standard projectile of the smaller weapon. On the other hand, sub-caliber ammunition is designed to enable a smaller projectile to be fired from a larger caliber gun for one or more of three purposes: (1) To increase the muzzle velocity; (2) to decrease the time of flight; and (3) to increase the penetrative powers. For the purposes listed above sub-caliber ammunition increases the efficiency of the weapons in which it is used. Discussion of the characteristics, advantages, and limitations of sub-caliber ammunition will not be made here, but can be found in regular Ordnance publications.

Four types of fuzes are in general use by the Soviets: (1) Superquick, used against personnel when ricochet or time fire cannot be used; (2) quick, used when maximum shallow blast is required, as in neutralizing field fortification; (3) delayed, used for maximum penetration and deep blast action or for ricochet; and (4) time, used for air bursts in registration and against personnel.

The Soviet rifle division has a total of 114 pieces of artillery, besides twenty self-propelled guns. The Soviet rifle army is likely to have an artillery division of some twenty battalions, and an anti-tank brigade. Much of this artillery is parceled out to corps and divisions.

FUTURE TRENDS

Possibly the most significant single contribution to the design of future Soviet artillery has been the acquisition of German materiel and design personnel. Although no German artillery has been reported to date as employed by the Soviets, it is believed that several outstanding German weapons are actually in use. These may include the German 17cm Gun

2000

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

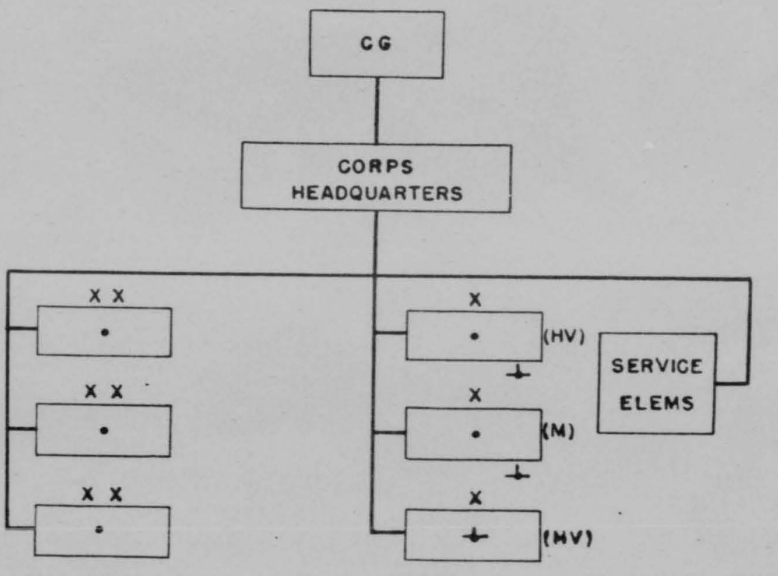
on a mortar carriage, the German 10.5cm Flak 38 and 39, and the German 12.8cm Flak 40 and 41.

Based upon the known standards of Soviet research and development, plus the acquisition of expert German personnel, there is little doubt that the Soviets are capable of producing, if time permits, some of the most outstanding artillery weapons in the World. Certainly, future Soviet artillery materiel should be, in all classes, on a par with the similar weapons of the United States and of the United Kingdom. In addition, the Soviets cannot be expected to relinquish their present lead in several classes of materiel.

ORGANIZATION

Artillery Corps

The Artillery Corps is a forward artillery headquarters with a balanced staff. It controls two or more artillery divisions and other GHQ artillery units which are assigned to it for a specific operation, or series of operations. Because the artillery corps is primarily a task force, there is considerable variation between corps, and within the artillery corps itself.



ARTILLERY CORPS

2001

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

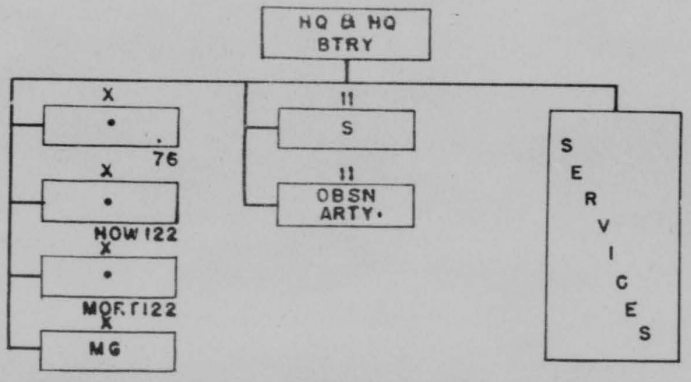
THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Artillery Division

The artillery division is a base of fire for major offensive and counter-offensive operations. It is essentially a task force headquarters with permanent planning, fire control, reconnaissance, intelligence and liaison staffs. It has adequate technical and service personnel for effective employment of 24 to 36 firing battalions. The number, type, and caliber of its component units depend primarily on its mission. It may be reinforced by GHQ heavy artillery regiments, aviation units, antiaircraft artillery and rocket regiments, army transport, and service units.

Tactically and strategically, the artillery division is not highly mobile. It requires extensive engineer assistance for road and bridge maintenance, preparation of firing positions, camouflage, and construction of shelters for personnel. Much of its equipment is tracked. Single units of the equipment weigh up to 35,000 pounds. There are also specialized weapons-artillery divisions, including the heavy gun division, and the antiaircraft artillery division. Little is known of the heavy gun divisions. Presumably, they consist of several heavy artillery brigades.



ARTILLERY DIVISION

Artillery Brigades

An artillery brigade is a permanent tactical unit comprising of a headquarters and a headquarters battery, two or three artillery regiments, and a service train. The headquarters battery has reconnaissance, survey, fire control, signal, and service platoons aggregating between 70 and 85 officers and enlisted men. An artillery brigade may be independent or a part of an artillery division.

Light Artillery Brigade - A light artillery brigade generally forms a part of an artillery division. It is armed with seventy-two 76mm

2002

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

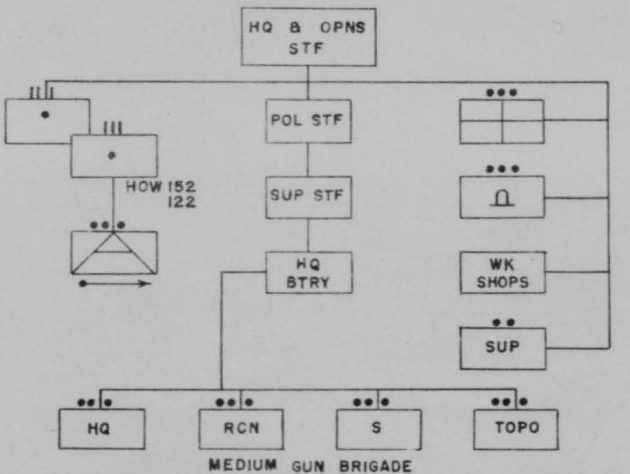
THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

guns. It is employed in close support of infantry and tanks, especially for direct fire. Its primary missions are destruction of personnel, infantry, light artillery weapons, and light field fortifications. The independent tank destroyer brigade is a variation of the light artillery brigade in which the firing batteries are controlled by the regimental headquarters. Battalion headquarters are eliminated.

Light Howitzer Brigade - A light howitzer brigade may be either independent or a part of an artillery division. It is armed with 122mm howitzers and their companion pieces, the 152mm howitzers. The brigade may be used for any mission except destruction of strong fortifications, or long-range fire. Its primary missions include destruction of personnel in the open and in shelters; accompanying and anti-personnel barrages and concentrations; neutralization of light fortifications, mortars, and light artillery weapons; and fire reconnaissance. Additional missions include destruction of mine fields, antitank ditches, and medium field fortifications. A light howitzer brigade consists of two howitzer regiments, and brigade troops.

Medium Gun Brigade - The medium gun brigade consists of two medium gun regiments, and brigade troops. It is armed with 152mm gun-howitzers and their companion pieces, the 122mm guns. The brigade is used against targets which are beyond the range and capabilities of the light howitzer brigade. Its primary missions are destruction or neutralization of artillery and armored trains, neutralization or interdiction of distant targets, destruction of field fortifications, fire reconnaissance of important or exceptionally resistant targets, and destruction of distant minefields. It is likely that the new high-velocity 100mm guns are replacing some of the 122mm guns in the brigade.



MEDIUM GUN BRIGADE

2003

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Heavy Howitzer Brigade - The heavy howitzer, and, possibly, the heavy gun brigade, armed with 203mm howitzers and 152mm guns respectively, consist of brigade headquarters and headquarters battery, four firing battalions, and brigade services. Primary missions of these brigades include destruction of permanent fortifications, bridges, railroads, and buildings. In tactical groupments, the 203mm howitzer is combined with its companion piece, the 152mm gun.

120mm Mortar Brigade - Every artillery division has a mortar brigade. Mortar brigades, however, also may be independent. A mortar brigade has good tactical and strategic mobility. It is armed with one hundred and eight 120mm mortars. Primary missions of the mortar brigade include: Destruction of personnel in the open and in light shelters; destruction of light field fortifications and wire barriers; destruction or neutralization of artillery, mortar, and infantry firing positions; accompanying and defensive barrages and concentrations; and smoke screens. A heavy mortar brigade is especially useful in woods. and swamps in direct support of infantry or cavalry. The brigade consists of three mortar regiments and brigade troops.

Artillery Regiments

Artillery regiments may be independent or may be parts of artillery brigades and artillery divisions, and organic to formations of combined arms. An artillery regiment generally consists of headquarters and headquarters battery aggregating between 75 and 100 officers and enlisted men, three firing battalions, and service troops.

Independent artillery regiments carry a full unit of fire for their subordinate units. Regiments which are parts of larger artillery units or of formations of combined arms carry one-third of a unit of fire. Regiments are the lowest housekeeping and administrative units of the artillery arm.

Artillery regiments may be homogeneous or heterogeneous. Homogeneous regiments include the light artillery regiment, the mortar regiment, and the rocket regiment. A light artillery regiment generally forms a part of a light artillery brigade. This regiment is often combined with a tank destroyer regiment to form an antitank groupment.

A heavy mortar regiment forms a part of a mortar brigade or it may be independent. It is used for destruction of personnel and materiel in open positions and in open trenches, for destruction of wire entanglements, neutralization of machine guns and mortars, and for the establishment of stationary and moving barrages. During artillery preparation for an offensive operation, the mortar regiment is often reinforced by a 122mm howitzer regiment to form a counter-mortar groupment.

The rocket regiment may be a part of a rocket brigade, or it may be independent. This regiment is used aginst area targets.

2004

THIS PAGE IS DECLASSIFIED IAW EO 13526

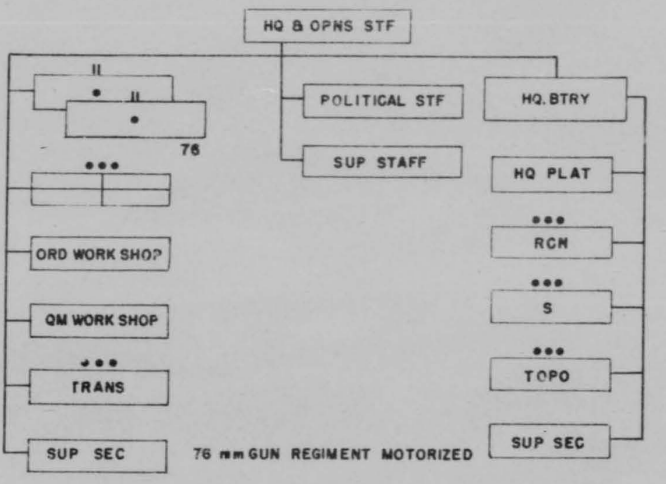
THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

The medium and light antiaircraft artillery regiments are also homogeneous. In addition to its primary mission of antiaircraft protection of ground troops and installations, it is employed for direct fire against ground fortifications, antitank defense, and, less often, for indirect fire against ground targets.

Heterogeneous artillery regiments include the divisional artillery regiment, the howitzer regiment, and the medium gun regiment. Missions of these regiments are the same as for the corresponding brigades.



Artillery Battalion

The basic organizational and tactical element of the artillery arm is the battalion. Independent artillery battalions have sufficient maintenance, repair, and service personnel to effect first and second echelon repairs and to carry one unit of fire and one refill of fuel for its subordinate units. Artillery battalions which form a part of larger artillery units (regiments and brigades) do not have maintenance and repair personnel. Their supply train carries one-half of a unit of fire. Artillery battalions which form a part of a formation of combined arms also have no service and maintenance personnel. Their ammunition platoon carries only one-third of a unit of fire.

There are two basic types of artillery battalions: The 12-piece, and the 6-piece battalion. The light guns and light and medium howitzers are organized into 12-piece battalions. The medium guns, medium gun-howitzers, and heavy guns and howitzers are organized into 6-piece battalions.

ARTILLERY BATTALION

CHARACTERISTICS

76mm Regimental Gun M1927

ILLUSTRATION NOT AVAILABLE

Caliber.....76.2mm

Horizontal Range.....9,350 yards

Rate of Fire (rpm).....12

Muzzle Velocity.....1,378 feet per second

Elevation Limits.....-6° to +25°

Remarks - While this weapon is obsolescent, it is still employed in considerable quantity.

2006

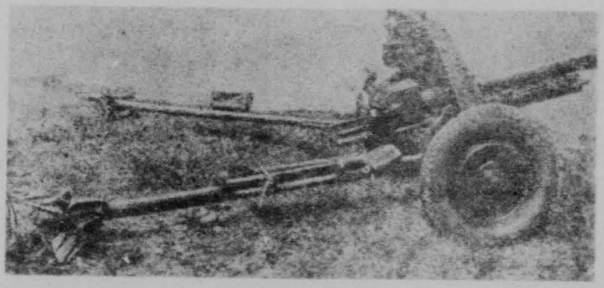
THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

76mm Regimental Gun M1943



Caliber.....76.2mm

Horizontal Range.....4,620 yards

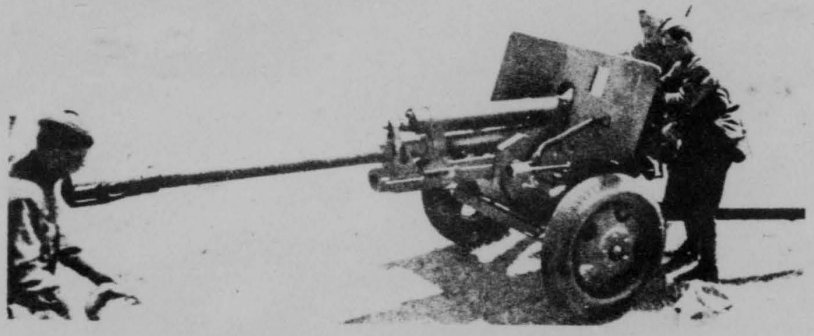
Rate of Fire (rpm).....12

Muzzle Velocity-860 feet per second

Elevation Limits.....8 ° to +25°

Remarks - Although the M43 Infantry Gun was produced to replace the M27, the actual results obtained have not been favorable. The Soviets admit that the M43 has not answered its design purpose, and when used with hollow-charge ammunition, it is incapable of dealing effectively with modern armor.

76mm Gun M1939 and M1942



Caliber.....76.2mm

Horizontal Range.....14,300 yards

Rate of Fire (rpm).....25

Muzzle Velocity.....2,230 feet per second

Elevation Limits.....6° to +45°

2007

THIS PAGE IS DECLASSIFIED IAW EO 13526

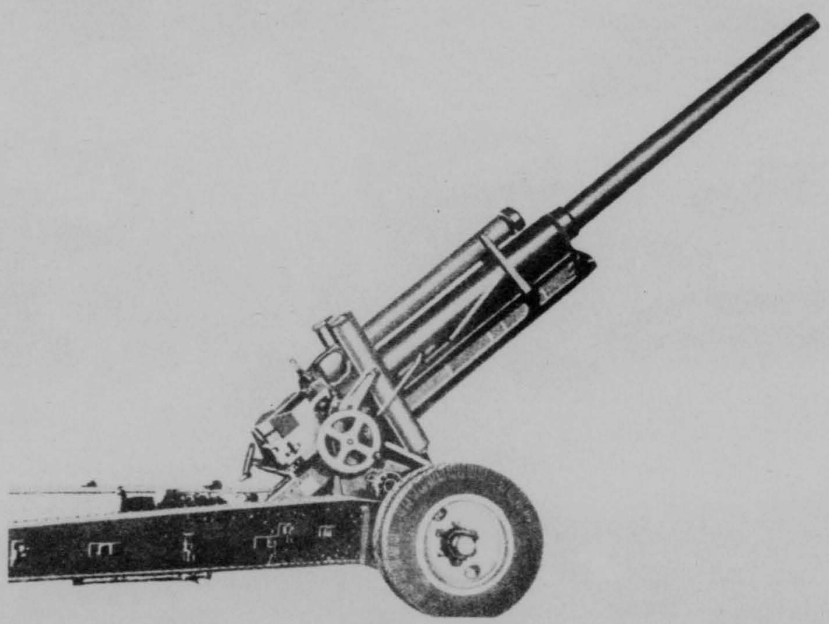
THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Remarks - The 76.2 gun M1939 and M1942 (ZIS-3) are basically identical and are characterised by a high rate of fire, good muzzle velocity and great maneuverability, are employed in close support of infantry (tanks) and especially for direct fire. Their primary missions are destruction of personnel and neutralization of infantry weapons in the open; anti-personnel barrages, destruction of tanks, vehicles, embrasures, and dragon's teeth by direct fire; and harassing fire. Secondary missions are: Accompanying barrages and concentrations; neutralization of artillery and mortars; establishment of smoke screens; and destruction of wire. Exceptional missions are fire reconnaissance, destruction of light materiel with indirect fire, and destruction of minefields. Division artillery.

107mm Gun M1940 M60



Caliber.....107mm
Horizontal Range.....19,100 yards
Rate of Fire (rpm).....6
Muzzle Velocity.....2,362 feet per second
Elevation Limits.....6° to +43°

Remarks - Corps Artillery.

THIS PAGE IS DECLASSIFIED IAW EO 13526

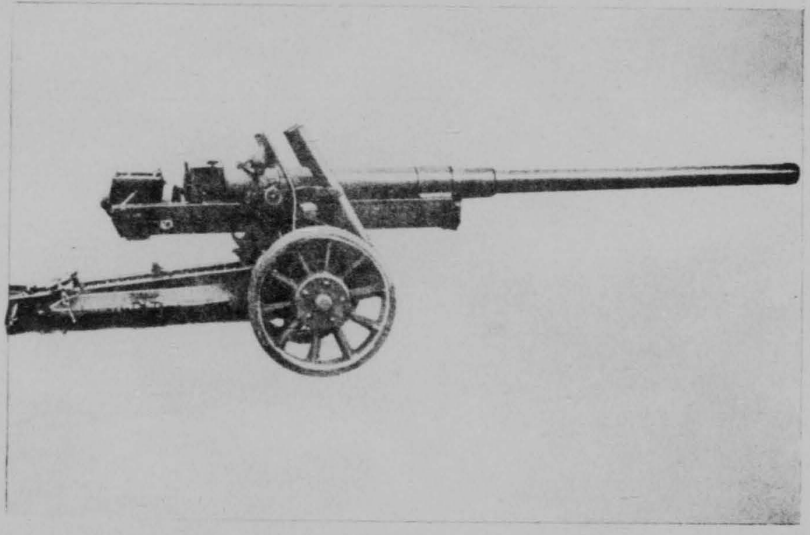
THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

122mm Gun M1931/37



Caliber.....121.92mm

Horizontal Range.....22,400 yards

Rate of Fire (rpm).....5 to 6

Muzzle Velocity.....2,625 feet per second

Elevation Limits.....-2° to +65°

Remarks - The 122mm guns (M31/37), the basic long range weapons of Soviet field artillery, have high muzzle velocity, great penetration and range, good rate of fire, but only moderate maneuverability. (They are replaced by 107mm guns M40 or 10/30 in difficult terrain or for rapid movement). They are employed against distant targets and for destruction of materiel. Their primary missions are: Neutralization or destruction of artillery and armored trains; neutralization, interdiction, or harassment of distant targets; destruction of moderately strong permanent fortifications by flat trajectory fire; and fire reconnaissance against distant targets. Secondary missions are : Destruction of tanks and vehicles by direct fire; destruction of elevated targets; and destruction or neutralization of field fortifications, trench mortars, infantry weapons, and infantry in the open. Exceptional missions are anti-personnel and accompanying barrages and destruction of mine fields. Corps Artillery.

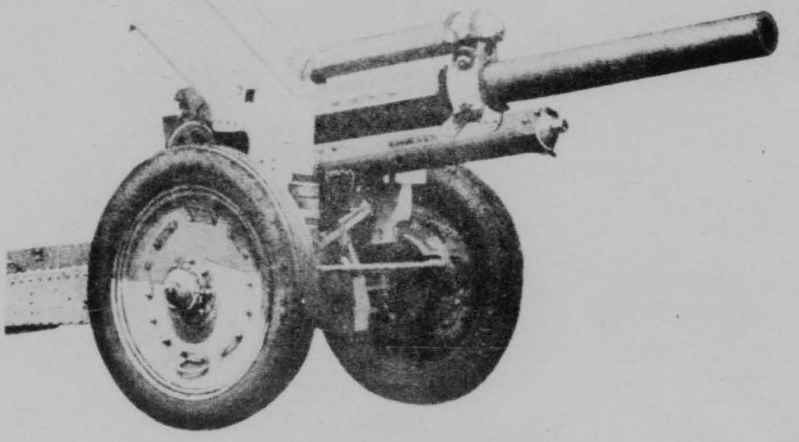
THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

122mm Howitzer M1938



Caliber.....121.92mm

Horizontal Range.....12,980 yards

Rate of Fire (rpm).....6

Muzzle Velocity.....1,690 feet per second

Elevation Limits.....3° to +65°

Remarks - 122mm howitzers M38, the backbone of Soviet field artillery, are characterized by great flexibility in muzzle velocity and trajectory, very effective burst, and good maneuverability. (The M10/30 howitzer is employed when terrain prohibits the use of the M38). They may be used for almost any mission except destruction of strong positions or for distant fire. Their primary missions are: Destruction of personnel and neutralization of infantry weapons in the open and under cover; anti-personnel barrages, accompanying barrages and concentrations; destruction of light field fortifications neutralization or destruction of mortars; fire reconnaissance against camouflage and minefields or in conjunction with sound ranging; neutralization of artillery at medium ranges; establishment of smoke screens; and harassing fire. Secondary missions include: antitank defensive barrages; destruction ofartillery; attack on fortified houses; destruction of wire; and destruction of tanks, ordnance, embrasures, antitank escarpments, and dragon's teeth by direct fire. The destruction of minefields is an exceptional mission. Division artillery.

THIS PAGE IS DECLASSIFIED IAW EO 13526

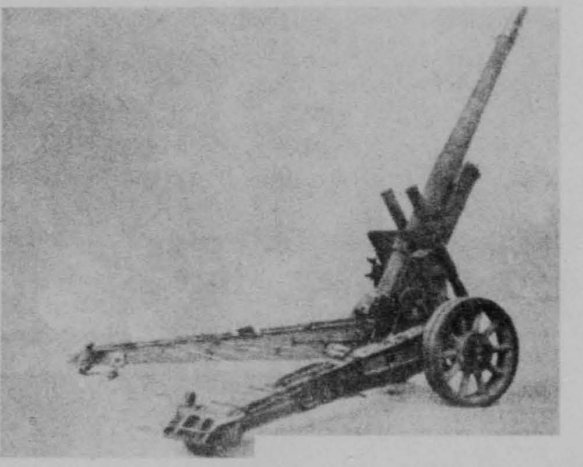
THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

152mm Gun-Howitzer M1937



Caliber.....152.4mm

Horizontal Range.....19,360 yards

Rate of Fire (rpm).....2 to 3

Muzzle Velocity.....2,133 feet per second

Elevation Limits.....-3° to +65°

Remarks - The 152mm gun-howitzers (M37) have much greater range and penetration than 152mm howitzers, but a lower rate of fire, and, except with the self-propelled KV mount, considerably less maneuverability. They are employed in conjunction with the 122mm gun against targets beyond the range or capabilities of the 152mm howitzer. Their most important missions are: Neutralization or destruction of artillery and armored trains; neutralization or interdiction of distant targets; destruction of strong field fortifications; destruction of moderately strong permanent fortification by flat trajectory fire; fire reconnaissance of exceptionally important or resistant targets; destruction or neutralization of trench mortars, infantry weapons, and infantry in the open; and destruction of tanks, vehicles, armor, and concrete by direct fire. Reinforcement of anti-personnel fire and employment in accompanying barrages and concentrations are exceptional missions. Corps Artillery.

152mm Howitzer M1943, D-1

ILLUSTRATION NOT AVAILABLE

Caliber.....152.4mm

Horizontal Range.....12,400 yards

Rate of Fire (rpm).....2 to 3

Muzzle Velocity.....1,657 feet per second

Elevation Limits.....-3° to +63°

Remarks - The 152mm howitzers (M43) differ from the 122mm howitzers in their greater radius of burst, slightly longer range, lower rate of fire, and reduced maneuverability. Basically, they reinforce 122mm howitzers, or replace them against more resistant targets. Their primary missions are: Destruction of personnel and neutralization or destruction of infantry weapons in the open or under cover; accompanying concentrations; antitank defensive barrages; destruction of light and medium field fortifications (including attack of fortified houses); destruction of antitank ditches; neutralization or destruction of mortars and artillery; fire reconnaissance; and destruction of minefields. Secondary missions include the following: Direct fire against very strong earth-and-timber fortifications; establishment of smoke screens; and reinforcement of antipersonnel and accompanying barrages. Exceptional missions are destruction of tanks and motor vehicles by direct fire, and harassing fire. Corps artillery.

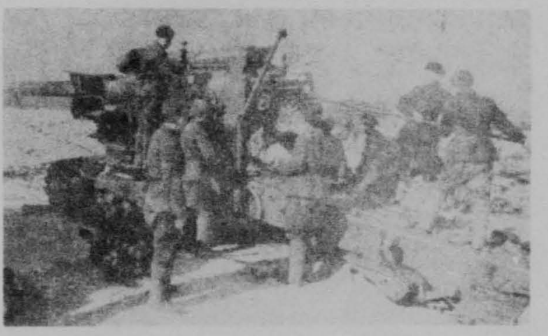
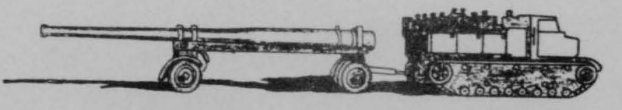
203mm Howitzer M1931



Caliber.....203mm
Horizontal Range.....19,700 yards
Rate of Fire (rpm).....1/3
Muzzle Velocity.....1,990 feet per second
Elevation Limits.....0° to +60°

Remarks - The 203mm howitzers are the most powerful pieces habitually used by Soviet field artillery when exceptionally great blast and penetration are required. Targets for these weapons must be carefully selected because of the low rate of fire and great weight of ammunition. Typical targets are permanent fortifications (either with flat trajectory or high-angle fire), bridges, railroads, and buildings. The 203mm howitzer may be employed for maximum blast effect at moderate ranges; at short ranges, heavy rockets are more economical. Heavy artillery.

210mm Gun M1939



Caliber.....210mm
Horizontal Range.....32,966 yards
Rate of Fire (rpm).....Unknown
Muzzle Velocity. .....2,624 feet per second
Elevation limits. .....0° to +50°

Remarks - The Soviet 210mm Gun is a copy of the Skoda 210mm piece.

ANTITANK ARTILLERY

GENERAL

Soviet antitank artillery weapons are well capable of fulfilling their designated role. Soviet design background, coupled with the combat experience of Soviet troops and intensive exploitation of German personnel and resources, places the U.S.S.R. in a position equal to that of any other major nation for future designing of antitank artillery weapons.

Soviet antitank artillery actually in the hands of troops has a definite advantage over similar weapons of the other major powers. This advantage does not result from Soviet designers producing better materiel than other powers. It results from the fact that the Soviets even in peacetime, have elected to produce their weapons in sufficient quantity to arm their forces fully with the latest antitank artillery weapons.

It is noteworthy that Soviet antitank artillery has been equipped with sub-caliber ammunition, which very materially increases its effectiveness and even renders the 45mm AT gun an effective weapon.

ARMOR PENETRATION OF SOVIET ANTITANK ARTILLERY

3,500 feet per second SC
Elevation Limits.....8° to $+25^{\circ}$

Remarks - Modification of 1932 and 1937 models; has a greatly increased muzzle velocity over the previous models, and is characterized by its unusually long barrel (about twice the length of the tube on 1932 and 1937 models).

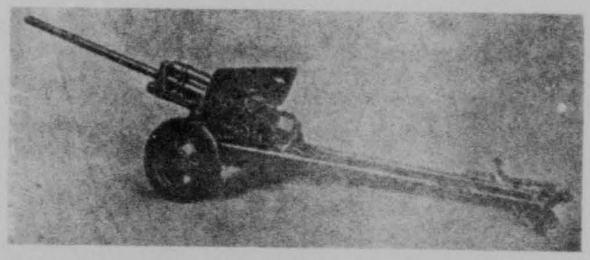
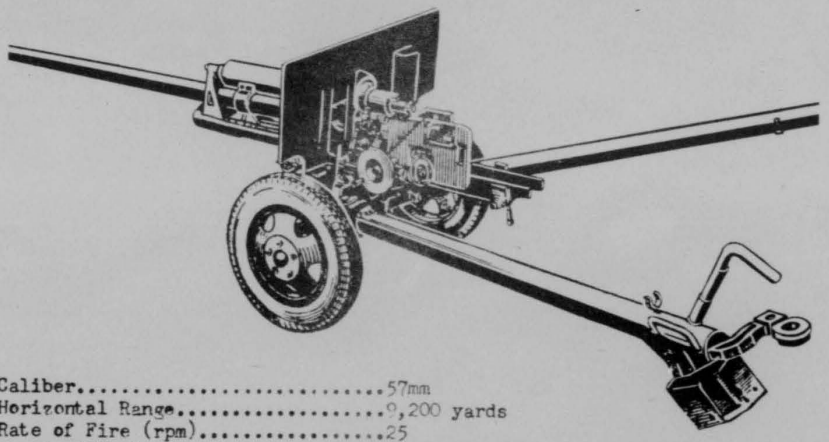
57mm M1941 Antitank Gun



Caliber.....57mm
Horizontal Range.....8,800 yards
Rate of Fire (rpm).....25
Muzzle Velocity.....3,240 feet per second AP
4,176 feet per second SC
Elevation Limits.....10° to +18°

Remarks - This gun provided the Soviets with a light-weight piece with an outstanding performance. Along with the 45mm, antitank guns are still present in the Soviet Army for antitank purposes, although in limited quantity. However, production has been stopped in favor of heavier caliber weapons.

57mm M1943 Antitank Gun



Caliber.....57mm
Horizontal Range.....9,200 yards
Rate of Fire (rpm).....25
Muzzle Velocity.....3,248 feet per second AP
4,176 feet per second SC
Elevation Limits.....5° to +25°

THIS PAGE IS UNCLASSIFIED

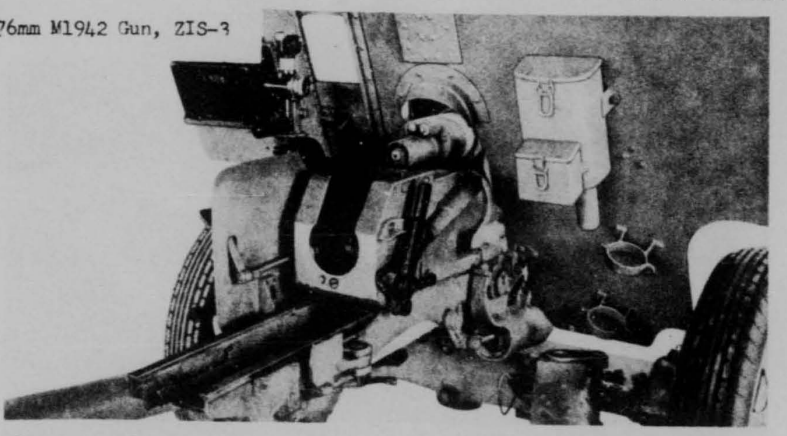
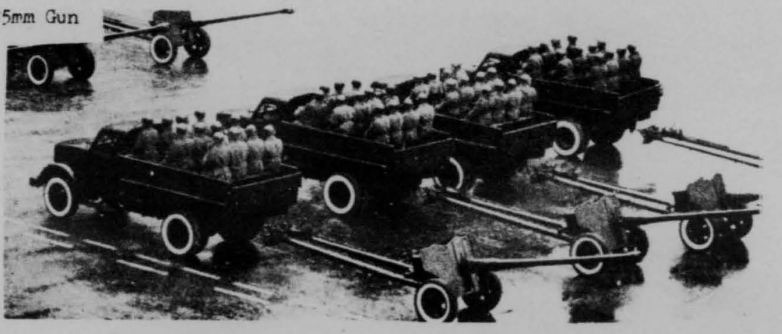
76mm M1942 Gun, ZIS-3



Caliber.....76.2mm
Horizontal Range.....14,300 yards
Rate of Fire (rpm).....25
Muzzle Velocity.....2,230 feet per second
Elevation Limits.....5° to +37°

Remarks - This field gun employed in AT roles when equipped with sub-caliber ammunition proved to be an effective antitank weapon.

85mm Gun



Caliber.....85mm

Remarks - Nothing is known about the piece except that it exists. May be a field gun or an antitank gun, probably the latter. This weapon has tubular steel trails, a concentric ring type of recoil mechanism, and a small irregularly sloped shield. It is believed to incorporate features that will render it more effective than either the 76 or 100mm weapons. These features include much lighter weight than the 100mm gun and superior armor-penetration capabilities compared with the 76mm gun.

THIS PAGE IS DECLASSIFIED IAW EO 13526

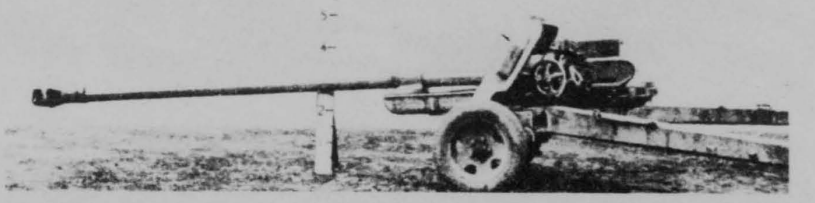
THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

This piece is unique in that it apparently incorporates a modified tank-gun recoil system. Apparently, the entire recoil system is located in two cylinders on top of the rear portion of the gun barrel. It is believed that the piece recoils through a sleeve. This light-weight piece may be an application of a Krupp design which was not introduced in World War II. It has not been Soviet practice to manufacture a weapon to replace a good piece (in this case the 100mm antitank gun M1944), unless there is something to gain thereby. Hence, this new 85mm piece must offer a performance superior to that of the 100mm weapon.

100 mm M1944 60-3 Field Gun



Caliber.....100mm
Horizontal Range.....22,900 yards
Rate of Fire (rpm).....8
Muzzle Velocity.....2,749 feet per second
Elevation Limits.....5° to +25°

Remarks - Either corps or AT artillery, depending upon its assignment.

This is the largest caliber antitank piece supplied in quantity in the hands of any army in the world. Although penetrations for this weapon are known only for the conventional AP projectiles, even with this type of ammunition the results are excellent. In addition, it is known that a type of sub-caliber ammunition has been supplied for this weapon. Its penetration is undoubtedly higher than that achieved with conventional ammunition.

In 1944, the Soviets culminated their race of gun versus armor by adopting as their standard antitank weapon a 100mm gun of very high performance. This weapon, which fires a 34-pound projectile at a muzzle velocity of 2,950 feet per second, has better penetration figures than those of any of the standard German, British or American antitank guns used operationally in World War II. Weighing 7,620 pounds, this weapon is 2000 pounds lighter than the most outstanding German antitank gun - the very efficient 88mm Pak 43/41. This Soviet weapon is today the outstanding operational antitank gun of the world.

ANTIAIRCRAFT ARTILLERY

GENERAL

Soviet antiaircraft weapons are divided into two major categories of materiel. The tactical, or field, class consists of all antiaircraft weapons up to and including 85mm caliber, while the strategic, or rear area, class consists of all antiaircraft artillery pieces over 85mm caliber.

Considerable information is available concerning the tactical class of weapons, enough upon which to formulate estimates as to its effectiveness. Such is not the case with the strategic weapons, as little is known about them.

During World War II the lack of modern fire-control devices proved to be the greatest weakness of Soviet medium and heavy antiaircraft artillery. This deficiency was so marked as to preclude the accurate delivery of antiaircraft fire by these weapons. Due to the materiel received from the United States under the Lend-Lease program and to the interest shown by the Soviets in such devices, this relative importance is not expected to be of long duration. In the past, reliance has been placed by the Soviets upon the ability of the Bofors Company of Sweden, one of the outstanding designers and manufacturers of light and medium antiaircraft materiel in the world, to produce antiaircraft weapons. Since 1930, the Soviets have based the design of their 37mm M1939, 40mm M1933, 76mm M1931, 76mm M1938 and 85mm M1939 antiaircraft weapons on Bofors manufactured weapons. Today, the exact state of relationship between the firm of Bofors and the Soviet Union is not known.

ORGANIZATION

Antiaircraft Artillery Division:- The Soviet antiaircraft artillery division corresponds roughly to a U.S. automatic antiaircraft weapon group. One antiaircraft artillery division is generally assigned to each operational Army, and one or more to each Army Group (Front). In addition to their primary mission of antiaircraft defense of important installations and troop concentrations, antiaircraft artillery units are used for antitank defense, support of ground troops by direct fire against targets whose destruction requires high-velocity fire, and less often for indirect fire against general ground targets. An antiaircraft artillery division is completely motorized and has good strategic mobility.

SELF PROPELLED ARTILLERY

GENERAL

Soviet self-propelled weapons are designated by the prefix "SU" followed by a number. This prefix is an abbreviation of the Russian "SAMOKHODNAYA USTANOVKA," meaning self-propelled mounting. In the majority of instances the subsequent figures indicate the caliber of the gun in millimeters. However, in one known case (JSU-249) the figures have no relation to the caliber but are thought to be a code or design number allotted at the time of the weapon's inception. Recent self-propelled guns, mounted on the Joseph Stalin heavy tank chassis, use the prefix "JSU" - the "J" indicating the Stalin mounting.

A possible weakness of Soviet gun mounts in self-propelled vehicles, is that they are capable of only very slight depression (average maximum depression of less than 4°.

All known pieces of modern Soviet self-propelled artillery consist of either field, antitank, or antiaircraft weapons which have been adopted to armored roles. All these weapons are ballisticelly identical with their parent pieces, fire the same kind of ammunition, and use the same ballistic charts.

Modification of field weapons for use in armored roles has been simple, usually consisting of a slight shortening or machining down of the barrel, or installation of a muzzle brake. In addition, recoil mechanisms suited for armored vehicle mounts are fitted on all weapons.

ORGANIZATION

In the Soviet Army, self-propelled artillery is a part of the tank and mechanized forces. Organization of the self-propelled artillery regiments reflects tank rather than artillery doctrine. In fact, the organization of the heavy tank regiment is the same as that of the heavy self-propelled artillery regiment. It has the same supply requirements and capabilities, and the same mobility. The medium self-propelled artillery regiment is a smaller version of the heavy regiment.

FUTURE TRENDS

Existence of super-heavy self-propelled pieces, ranging in caliber from 172mm to 210mm has been reported. These are in the advanced experimental stage, and production of a super-heavy piece for special roles is a strong possibility for the very near future, it is believed. In addition, the mounting of the German 172mm (used by the Germans with outstanding success, mounted on a mortar carriage) on a special SP chassis would produce a splendid weapon. Recent reports indicate that this may already have been done on an experimental basis.

THIS PAGE IS UNCLASSIFIED

GUIDED MISSILES

GENERAL

The successful introduction of guided missiles in World War II by the Germans resulted in a race in this field by the major victor nations. The USSR, like the other principal nations, came into possession of: (1) German technical personnel familiar with the development of guided missiles; (2) a number of actual missiles and components; (3) technical information on research; (4) manufacturing data.

The research and development of guided missiles has followed two broad but related fields.

(1) To produce weapons which can accurately hit any area on the surface of the earth, with whatever radically new explosive and propulsive substance may become available.

(2) To produce antiaircraft weapons that will be effective against future jet-propelled bombers, against which conventional AA artillery will be relatively ineffective owing to the high bombing altitude and speed.

Under group (1) above are the V-1 and V-2, A-9 and A-10. Under group (2) are the HS-117, Wasserfall, Enzian, Rheintochter, and X-4.

It is reported that the USSR is building and stockpiling a slightly improved version of the German V-2.

It is believed that by 1950 the USSR could have usable AA guided missiles, based on German design, ready for production.

THIS PAGE IS UNCLASSIFIED

TACTICAL CONSIDERATIONS: LONG RANGE GUIDED MISSILES, GROUND TO GROUND

It is believed that for the first few months after a declaration of war, guided missile operations will be more for the purpose of gaining operational experience than for striking decisive blows. Reasons for this belief are:

It is logical to use aircraft if they are available in great numbers, and the Soviet has an overwhelming superiority in bomber and fighter strength.

Logisitc problems, imposed by operational employment of guided missiles on a large scale, are so great that establishment of supply channels probably would require several months.

The above conclusion is based on the assumption that the rockets available will have the same range and accuracy characteristics as those produced by the Germans. If, however, the Soviet has been able to solve the tremendous problems incident to increasing the range, launching sites could be prepared inside the present Soviet-controlled areas prior to opening of hostilities and logistic problems would largely be solved in advance. In spite of present inaccuracy, these weapons would be very effective against large industrial and densely populated areas, such as London.

The Germans had in the development stage the A-9 and A-10 guided missiles, intended for use against the continental United States. The present state of these in the Soviet Union is unknown.

Although the testing range for long-range guided missiles is partly in the Arctic, this does not necessarily point to strategic planning for trans-polar rocket attacks.

CAPABILITIES OF USSR FOR A MISSILE OFFENSIVE

Against Land Targets -

Utilizing the full production capabilities of German factories now controlled by them, the Soviets could produce enough V-1 and V-2 bombs to launch approximately 25 V-2's and 80 V-1's daily from current production, plus an additional number of V-1's from previous stockpiling.

Against Air Attack -

Little is known of the stage of development of ground-air guided missiles in the Soviet Union. They have been working on this since 1945, and, in addition to having complete samples of each missile and technical details of its operation, they also have a group of competent German scientists and technicians to carry on the development work. It is estimated that by 1950 the Soviets could have a usable AA guided missile ready for production.

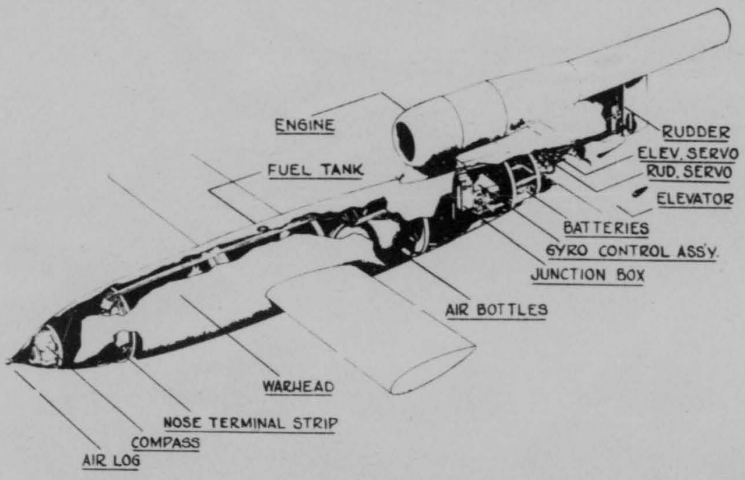
THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

CHARACTERISTICS

V-1



Total Launching weight.....3 tons.
Payload.....1983 lbs.
Length.....25' 4"
Wing Span.....16'
Fuzes.....3 (1 elec. impact, 2 mechanical)
Maximum Range.....150 miles (approx) 50% hits in circle of 8 miles radius at range of 130 miles.(Ground launched).
Stockpiling.....Can be stockpiled.
Vulnerability.....Approx. 60% successfully launched were destroyed before reaching target. 20% of launchings were failures.
Countermeasures.....Fighters, flak, barrage-balloons.
Lethality.....Average 2.2 deaths per V-1 reaching London.
Launchings.....From ramps, or from aircraft, which renders a/c vulnerable to fighters.

Remarks - Smaller and cheaper (cost of 20 V-1's equals approximately the cost of one V-2) than the V-2, can be air-launched. Has greater payload.

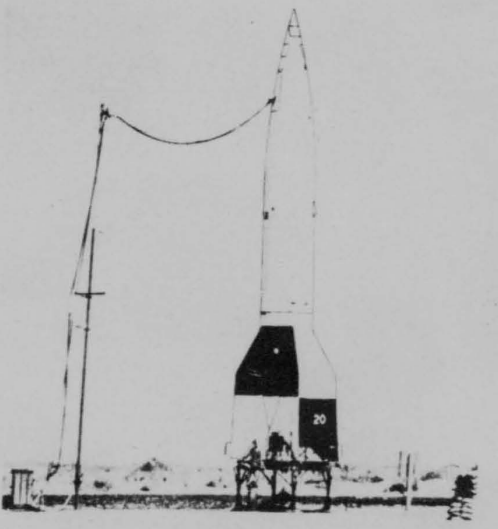
THIS PAGE IS DECLASSIFIED IAW EO 13526

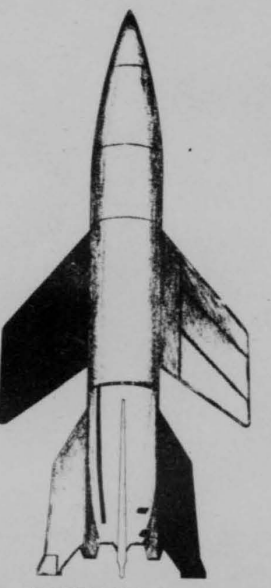
THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

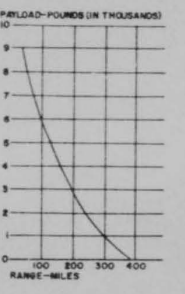
V-2 (A-4)





WINGED V-2 (A-4b)

Launching Wgt.....14.85 tons
Payload.....1620 lbs.
Length.....45' 10"
Maximum diameter.....5' 6"
Fuzes.....5, (1 elec. impact 2 mech. in nose, 2 mech in tail)
Maximum Range.....225 miles approx.
Accuracy.....50% hits in circle of 11 miles radius at range of 200 miles
Vulnerability.....None destroyed at active defense. 15-20% malfunctional
Countermeasures.....None
Lethality...Av 4.8 deaths per V-2 reaching London
Launching...From mobile metal or concrete platform
Stockpiling..Extremely difficult,particularly the liquid oxygen which is the chief fuel component.



Remarks - V-2's killed more than twice as many people per missile than the V-1, and did slightly more structural damage than the V-1. No means of destroying the V-2 after it is launched has yet been developed. Its launching site can be easily concealed. It has a greater ground range. The V-2 is also known as the A-4. The A-4b is the same missile with wings attached as per illustration, which has the effect of approximately doubling the range.

2037

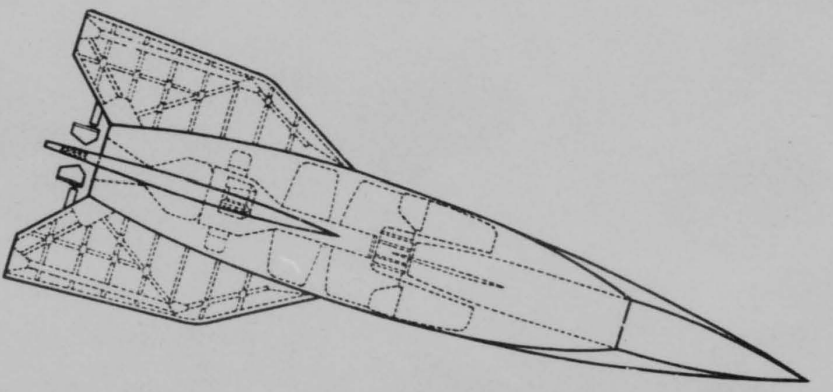
THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

A-9



The A-9 guided missile is similar in appearance to the A-4b. It differs only in internal structure. Like the V-2, it isshot vertically into the air, and bent towards the target; but, rather than falling, it glides like the A-4b, until it is over the target, where it goes into a vertical dive. It would travel about 600 kilometers in 17 minutes.

It was proposed to launch the A-9 from a catapult at supersonic speed to increase the range. It was also proposed to install a pressurized cabin and to use a human pilot. The pilot would drop the warhead on the target and then return to his base. A retractable landing gear would be used in the landing which it was felt could be carried out at a speed as low as 160 kilometers per hour.

At the close of World War II, the A-9 was under development by the Germans, but none were ever built. Evidence indicates the Soviets are working on the development of this missile.

2038

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

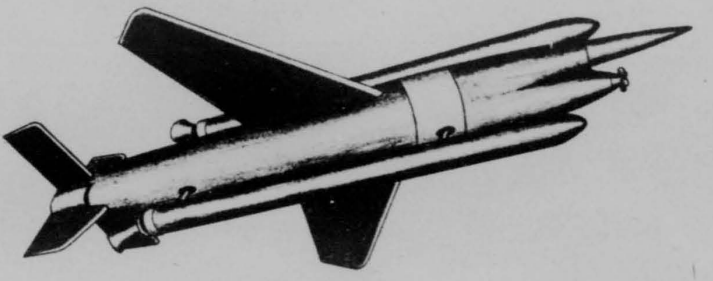
THIS PAGE IS UNCLASSIFIED

A-10

This missile was never built, but calculations were complete. It was to be used as an assist takeoff motor for the A-9, supplying a thrust of 200 tons before being jettisoned. The A-9/A-10 combination was expected to have a range of 5000 km, and an ultimate velocity of 2800 meters per second. After being jettisoned, the A-9 motor would begin to function. It was also proposed to use a human pilot in this combination.

Considering that calculations on this missile were complete, and that the Germans had planned to use this weapon against the continental United States in the early months of 1946, it must be assumed that the Soviets have continued development of this missile.

Hs 117 (Schmetterling)



This small subsonic airplane, 13 feet long with a 6 1/2 foot span was powered by a liquid-fueled rocket unit. It was to be guided by radio, using optical tracking. The warhead weighed 55 lbs. and was to be fired by a proximity fuze. It was to have an effective range of 10 miles, an altitude ceiling of 35,000 feet and an expected accuracy of 8 yards.

Development of this missile was given a high priority by the Soviets.

The HS 117 was used experimentally by the Henschel aircraft firm in 1941, but its development was not pushed until 1943. The project, scheduled for completion in February 1945, was still in the development stages on VE-day. Of 59 missiles test-fired, 25 performed satisfactorily.

2039

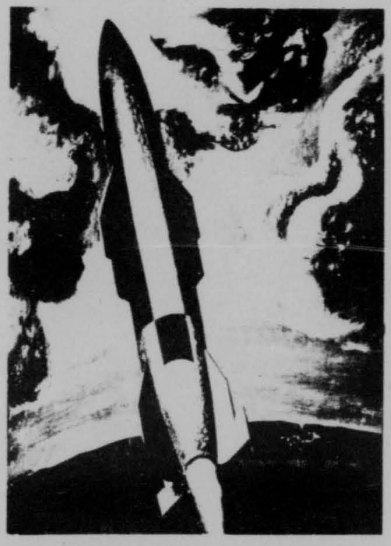
THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Wasserfall



This radio-controlled supersonic rocket, similar in operation to the V-2 (A-4), weighed only 4 tons. It was designed to destroy a plane 30 miles away, flying at an altitude of 65,000 feet and a speed of 560 miles per hour. The missile was to have a 200-pound warhead and an infrared proximity fuze and homing device.

Research began on this missile in 1942. Of 25 rockets fired, 15 operated satisfactorily.

Production plans had been drawn up calling for 5000 units per month, but production never began.

The Soviets are working on this missile, but it is reported that no important progress has been made, and that the work still consists of attempts to develop the original German designs.

Enzian E-4 and E-5

This subsonic rocket-propelled, radio-controlled missile carried a 1050-lb. warhead and was designed for use against heavy bomber formations. Research began in 1943 and of 30 test-fired, only 10 were successful. In appearance, it bears a striking similarity to the Me-163. Total weight is 1800 kg including the 320 kg of the four assist take-off units shown in the illustration. It attained its velocity of 300 meters per second with a main thrust unit delivering 2000 kg initially, decreasing to 1000 kg during flight. Duration of power was 72 seconds, resulting in vertical range of 16,000 meters and a horizontal range of 25,000 meters.

It was planned to launch the Enzian from a ramp 6.8 meters in length. The assist take-off units are jettisoned after 5 seconds and the Enzian is directed to the target vicinity under radio control, using either line-of-sight or radar navigation. When the missile's approach to the target comes within the operating range of the particular self-seeking head employed, the latter would assume control and direct the Enzian to the target's proximity on a modified homing course. The proximity fuze at predetermined distance activates the warhead, which is designed to insure maximum effective damage to the target from 45 meters.

The Enzian E-5 was similar to the E-4 but was tailless and had crossed wings. It had a 550 lb. warhead, radio-control, homing device, prox-

2040

THIS PAGE IS UNCLASSIFIED

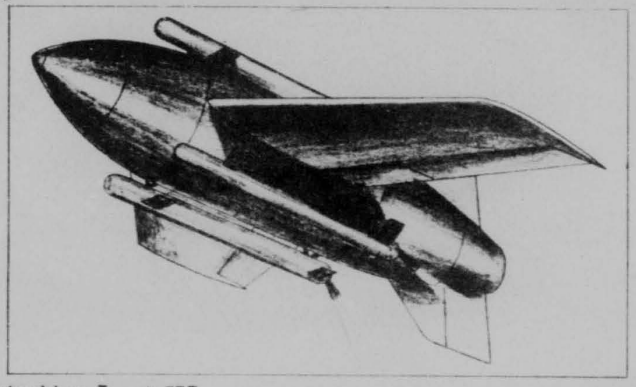
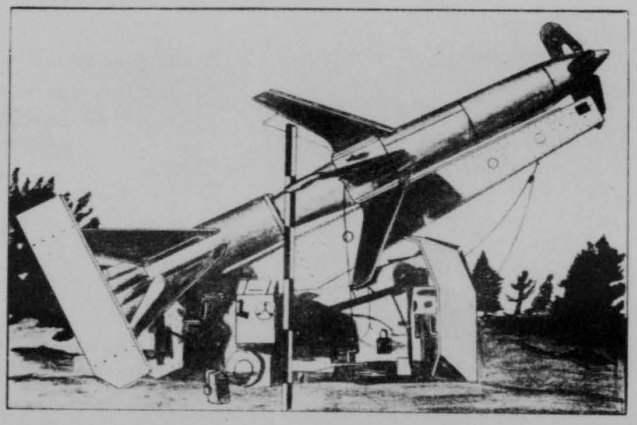
imity fuze and one-axis gyro stabilizing system. It was the latest outgrowth of the Enzian E-4. The missile had progressed beyond the preliminary design stage, but the prototype had not been built.

No information is available regarding the status of this missile in the USSR.



Rheintochter I and III



The Rheintochter I was a subsonic, radio-controlled, solid fueled rocket. It was never seriously considered for production, but rather as an experimental model for use in designing the Rheintochter III.

The Rheintochter III was designed for high velocity using liquid fuel, and carried a 330-pound warhead. Only 6 of the III were test-launched, none of them having any controls. No production of this missile was ever planned.

2041

THIS PAGE IS DECLASSIFIED IAW EO 13526

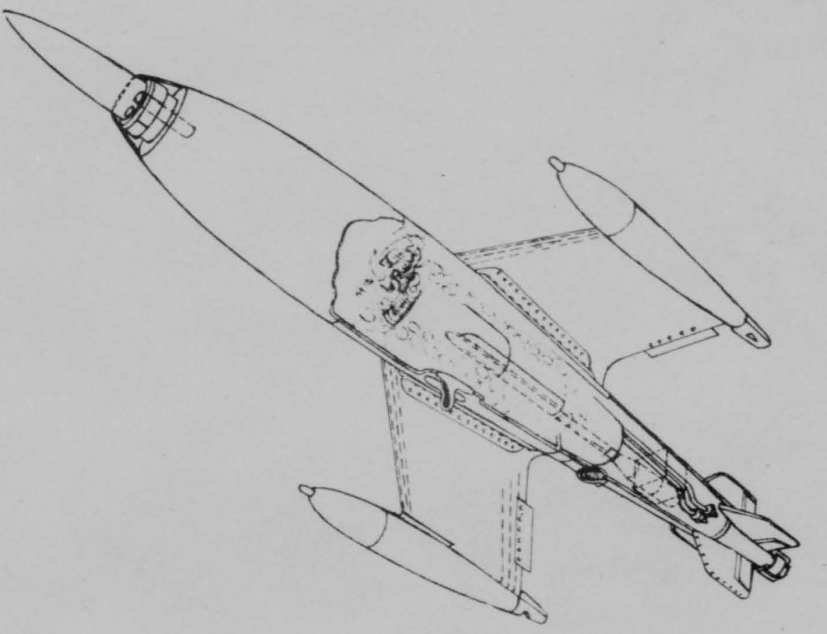
THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

X-4



This is a fin-stabilized guided missile, with proximity fuzed warhead of about 44.1 pounds, which could be launched by fighter planes against large bomber formations.

It was planned to use wire control and presumably visual tracking from the parent aircraft. Such control would restrict its maneuverability and render the parent aircraft more vulnerable. With acoustic homing device installed, the X-4 could be launched, and the parent aircraft could immediately execute an evasive maneuver.

No information regarding development of this missile is available at the present time.

ROCKETS AND ROCKET LAUNCHERS

GENERAL

Soviet rocket weapons are characterized by a very small number of projectiles and launchers and a strict adherence to conventional design. The original rockets were aircraft type, dictated by the need for a suitable means of combating armor. These were followed in late 1941 by three ground launchers - the M-8, M-13, and M-30 - which remained the only field equipment until the introduction of the M-31 in 1945.

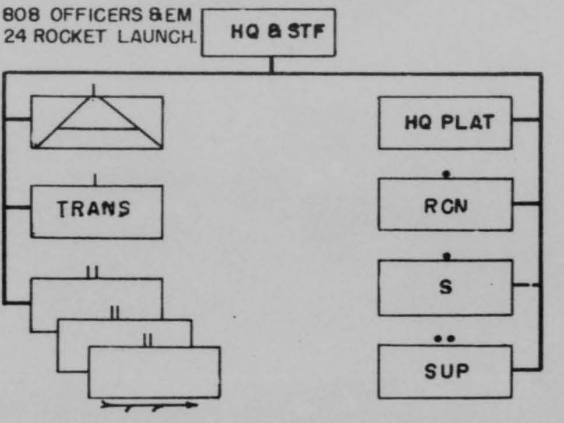
It is believed that the three mobile launchers (the M-8, M-13 and M-31) will fulfill the Soviet demands for field equipment and that further development will be restricted to other types such as antitank and antiaircraft rockets.

Similarly, rocket projectiles are limited to a small number, all of which are of conventional fin-stabilized design. All are fired electricclly, using either a pyrotechnic device integral with the launching rail or an internal electrical squib. There is still insufficient information concerning the construction of projectiles above 132mm caliber and the performance of all types. It is possible that spin-stabilized projectiles are under development.

The principle of rocket employment in the Soviet Army prescribes mass commitment at critical phases of an operation. Rocket units are normally coordinated in the general plan of artillery and mortars, and are under the control of corps artillery.

ORGANIZATION

Rocket Regiment (M13)



2043

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

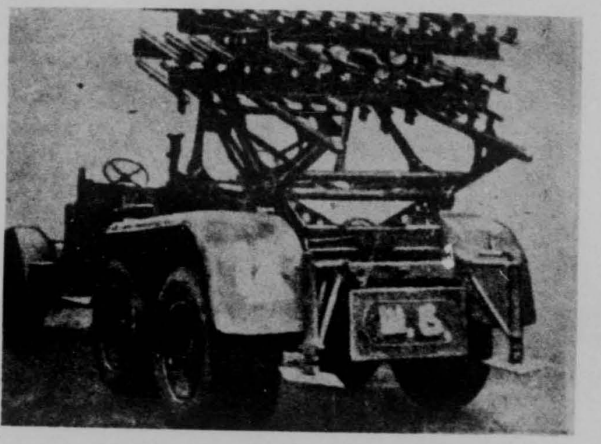
THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

The rocket regiment (M13) may be a part of a rocket brigade, or it may be independent. It has a balanced headquarters, three rocket battalions with two rocket batteries each, an antiaircraft machine gun company, and services. This regiment is used against area targets. Weight of metal of a single salvo from this unit is more than seven (7) tons.

CHARACTERISTICS - LAUNCHERS

M-8



Status.....Standard

Number of Rounds Launched per Salvo.....38

Type of Rounds Launched.....RS - 82 Believed to fire an 82mm incendiary rocket

Remarks - Mobile ground launcher. Some indication has been received that in cases of dire need, this projector is used in anti-aircraft roles for barrage effect against low-flying aircraft.

ARMORED VEHICLES

GENERAL

The Soviet Army now has an estimated 25 tank divisions and 30 mechanized divisions. This gives a relative proportion of almost one (1) armored or mechanized unit to three (3) infantry units in the Soviet Ground Forces as a whole. The wartime ratio was approximately one to ten.

All known Soviet tanks employ standard field artillery fire-control devices for indirect fire; namely, the Schneider or the German type of quadrant sight for indirect fire, as well as direct-fire telescopes.

A possible weakness of Soviet Gun mounts is that they are capable of only slight depression. Modern tank pieces have an average maximum depression of less than 4° .

ORGANIZATION

Examples of Normal Unit Strength

Medium Tank Regiment	- 1,300 men	- 65 tanks
Heavy Tank Regiment	- 1,400 men	- 65 tanks
Motorized Rifle Regiment	- 2,200 men	-
Mortar Regiment	- 600 men	- 35 mortars
Howitzer Regiment	- 600 men	- 24 guns
Rocket Regiment	- 200 men	- 16 rocket launchers
Antiaircraft Battalion	- 320 men	- 18 guns
Engineer Battalion	- 350 men	
Signal Battalion	- 200 men

THIS PAGE IS UNCLASSIFIED

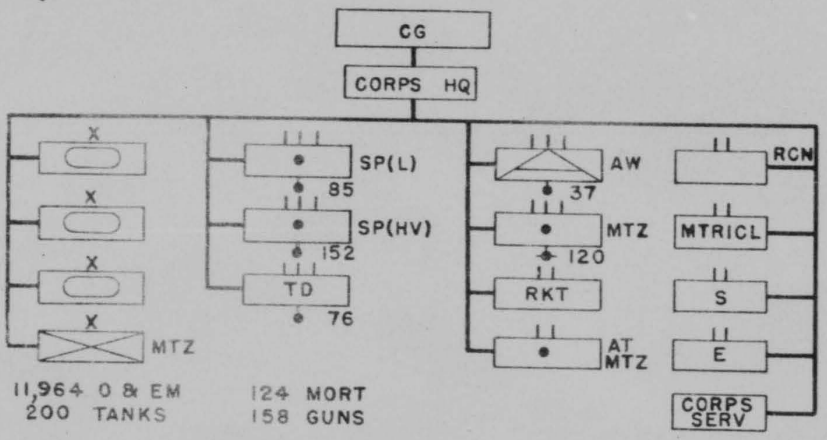
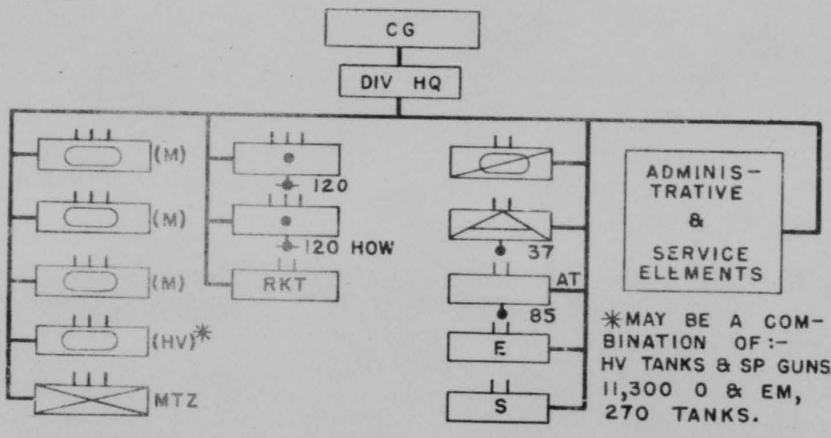
Corps



A tank corps usually forms a part of the mobile striking forces of the commander of a front or an army. It is used to deliver a decisive blow on a narrow sector, and in cooperation with other arms to exploit a breakthrough.

Division



The existing tank division is a development of the wartime corps. The present tank strength of the division consists of medium tanks, nearly equivalent to U. S. Pershing tanks, and heavy tanks as well. Personnel strength of units has not been reduced materially. The main change is mostly a matter of shifting components. Self-propelled ar-

2052

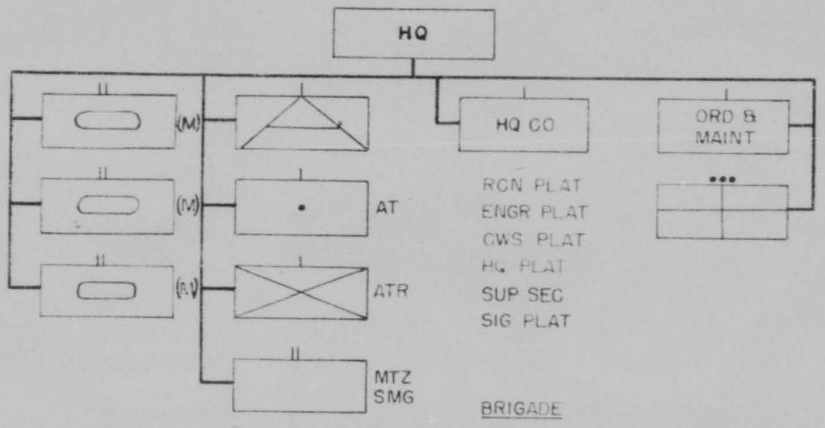
THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

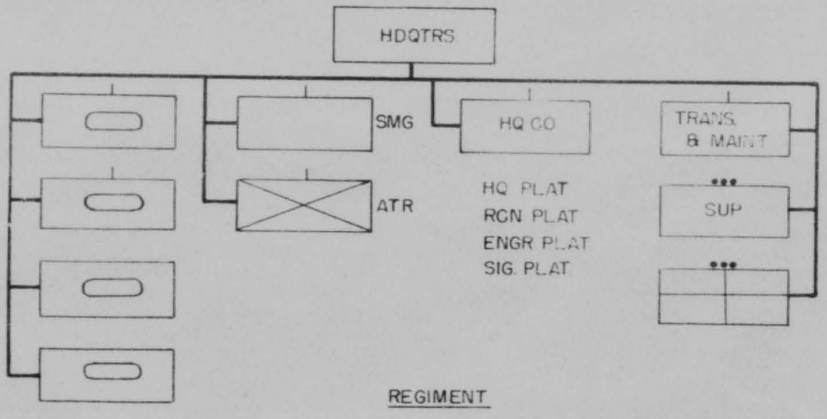
tillery probably has now been released to a higher echelon and most likely is controlled by army or army group, to be attached to divisions as the situation demands.

Brigade



The mission of a tank brigade is destruction of hostile infantry by means of fire and shock action. Maneuverability of a tank brigade is good, although its service echelon is road bound. A tank brigade usually forms a part of a tank corps. With corps resources, a tank brigade can be committed to moderate combat for 5 or 6 days.

Regiment



2053

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

The basic organizational elements of the tank arm of the Soviet Army are the medium tank regiment, the heavy tank regiment and the tank battalion. The medium tank regiment is a balanced organization with its own reconnaissance, engineer, signal, and maintenance units. The heavy tank regiment is independent. It has relatively large supply and maintenance units. It is used to support infantry and medium tanks during attacks on heavily fortified positions, and as heavy artillery in support of mobile operations.

Battalions

Two types of tank battalions exist in the Soviet Army. They are the independent tank battalion and the tank battalion which is organic to a tank brigade. The mission of the independent tank battalions is the same as for heavy tank regiments, that is, to support the infantry and medium tanks during attacks on heavily fortified positions, and as heavy artillery in support of mobile operations.

TACTICS

Employment of Tanks

The Soviets recognized during World War II that tanks can be employed effectively both in direct support of infantry and in large tank units with relatively independent missions.

By the end of the war, heavy tank "break-through" regiments were being attached to rifle divisions to support the infantry assault with their firepower and shock action.

The combat tasks of Soviet armored forces are to deliver decisive blows on a narrow sector, to wedge deeply into the enemy defensive system, and, in coordination with other arms, to envelop and destroy large hostile units. The paramount principles of Soviet tank tactics are the continuity of coordination with other arms, and full exploitation of tank mobility.

Current Soviet doctrine requires that all armor be given local protection by infantry, normally riding the vehicle prior to deployment, in order to combat concealed infantry traps. Advance engineer detachments and engineer tank riders clear lanes in minefields. The organic self-propelled artillery of these units is used in the dual role of assault guns and for centralized massed indirect fire.

The Soviets consider that armored forces are most effectively employed to the depth of the enemy operational zone. After intensive artillery preparation, the infantry assault penetrates into the enemy defenses. Then, armored forces strike in the direction of the deepest infantry penetration on a narrow front, from a concealed centralized position, develop the break-through, and strike at the enemy's rear to destroy him.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

The Tank Offensive

An assault by tank forces, normally a tank division, differs in several respects from the coordinated infantry attack. In the tank offensive, tanks attack in deeply echeloned formation in a narrow sector, using their fire and shock power to effect a penetration. Resistance is by-passed in order to avoid full deployment and protracted local combat. Infantry and artillery mop up enemy strong points and provide flank security for the tank units against counter-attack. The tank forces are assigned specific terrain objectives in the rear, rather than mission-type orders.

The tank forces themselves cannot hold territory, but must rely upon the following infantry and, occasionally, cavalry. The tank units destroy enemy rear installations and supply lines, and attempt to encircle and destroy the enemy by coordinating their penetration with adjacent units in a wide turning movement or a double envelopment by converging tank penetrations.

CHARACTERISTICS

Light Tank T-70

Caliber of main armament.....45mm
Maximum range of main armament.....5,500 yards
Rate of fire of main armament.....25 rds per minute
Weight w/combat load.....10.8 tons
Speed - Maximum.....28 mph
Cruising.....19 mph

Remarks - Main Soviet light tank of World War II.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Medium Tank T-34 (85mm gun) "Workhorse of the Armored Force"

Caliber of main armament.....85mm
Maximum range of main armament.....10,500 yards
Rate of fire of main armament.....7-8 rds per minute
Weight w/combat load.....35 tons
Speed - Maximum.....34 mph
Cruising.....19 mph

Remarks - The most widely used tank in the Soviet Army. The T-34 (76.2mm gun) is now obsolete with the Soviets having superceded it in 1944 by the T-34 (85mm gun). The T-34 (85mm gun) is believed to be in the process of being replaced by the T-44 Medium tank.

THIS PAGE IS UNCLASSIFIED

Medium Tank T-44

ILLUSTRATION NOT AVAILABLE

Caliber of main armament.....85 to 100mm

Maximum range of main armament.....85mm - 10,500 yards
100mm- unknown

Rate of fire of main armament.....85mm - 7-8 rds per minute
100mm- 6 rds per minute

Weight.....85 mm version.....34 tons
100mm version.....34 tons

Speed.....85 mm version....maximum..30 mph
cruising..19 mph
100mm version....maximum..34 mph
cruising..19 mph

Remarks - An improved version of the T-34 (85mm gun). This tank closely resembles its progenitor, but has benefited by a reduction in overall height, increased armor, and cleaner glacis plate. Despite these improvements, the total weight of the tank is said to be one ton less than that of the T-34 (85mm gun), resulting in at least equal, if not slightly superior, mobility and cross-country performance. This tank is armed either with an improved 85mm gun or with the 100mm antitank gun M1944. Recent reports indicate that it is probably the latter.

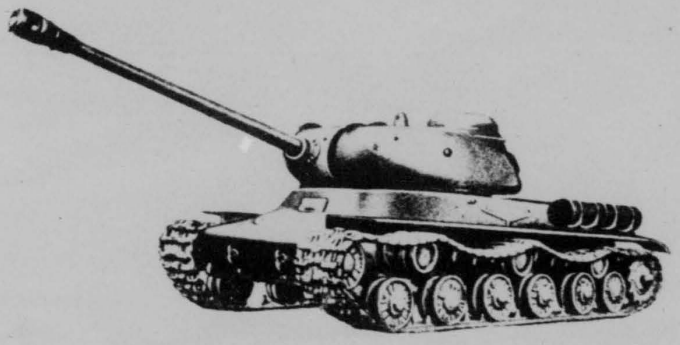
Heavy Tank "JS-1" and "JS-2" (Joseph Stalin 1, 2)



Caliber of main armament.....122mm
Maximum range of main armament.....Unknown
Rate of fire of main armament.....3 rds per minute.
Weight w/combat load.....50-55 tons
Speed.....Maximum.....15-20 mph
Cruising.....10 mph

Remarks - The JS-1, which saw combat in 1944, was based on a modified KV chassis. (KV 1 heavy tank was produced in 1941 and is now obsolete). Shortly afterwards, the Joseph Stalin 2 was produced. This closely resembled the JS-1 in design, but incorporated a redesigned hull front plate. Both proved quite capable of dealing adequately with the German Mark V and Mark VI heavy tanks.

THIS PAGE IS UNCLASSIFIED

Heavy Tank "JS-3" (Joseph Stalin 3) "Shchuka" (Pike)

Characteristics are the same as the JS-1 and 2.

Remarks - The JS-3 is the present standard Soviet heavy tank, and is the latest known development in the Joseph Stalin series. The heavy armament (122mm gun) and thick, well-shaped armor make this one of the most revolutionary tanks ever designed.

The front plate is unlike that of any other tank and affords an easy recognition feature. The plate is in two sections and shaped like the prow of a ship, thus giving horizontal as well as vertical deflection.

This tank is regarded by some observers as the outstanding heavy tank in the world today.

FUTURE TRENDS

The originality and excellence of Soviet Tank design, which was apparent throughout World War II, gives every indication of being maintained in post-war developments. Indications are that much effort is being directed at improving existing materiel, and it is thought that several new types of combat vehicles have at least reached the prototype stage. While authoritative information is lacking, the most significant of these developments appear to be:

Type	Remarks
Super-heavy tank or self-propelled gun	Numerous reports have indicated the production of a super-heavy tracked vehicle weighing in excess of 100 tons and mounting a gun of at least 152mm caliber. It is probable that it is a self-propelled gun for special tasks rather than a combat tank.
Heavy Tank, JS-4 (Joseph Stalin-4)	Little is known of this other than it appears to be a heavier development of the JS-3. This tank may be fitted with a flame-thrower in addition to its normal armament.
Light Tank	There seems to be a distinct possibility that the Soviets have produced a midget tank carrying a two-man crew. Such a vehicle is probably intended for reconnaissance or air borne tasks.

Soviet designers, it is believed, are continuing to take an interest in even heavier tank armament. Undoubtedly, they are attempting to produce a weapon for heavy tank roles in excess of 122mm in caliber. Since the Soviets have adhered to the policy of adapting successful field pieces to armored roles, it is not unlikely that the next weapon to be installed in their heavy tanks will be of 152mm caliber.

Emphasis on armored units in the current Soviet reorganization program make it appear that the Soviets are preparing for a war of maneuver. Their successes on various parts of the Eurasian land-mass demonstrate the Soviets ability to utilize their armored units to the best advantage in any type of environment. The Soviets have shown decisive capabilities for successful employment of large mobile concentrations.

THIS PAGE IS UNCLASSIFIED

ARMORED CARS

During World War II, the Soviets employed to a large degree U.S. scout cars (M-3) for armored car roles. For tasks beyond the capabilities of wheeled vehicles, T-70 or T-34 tanks were used. Production of personnel carriers, recovery tanks, flame-thrower tanks, etc., appears to have been limited to the adaptation or modification of various types of combat tanks, rather than to the manufacture of specially designed, unipurpose vehicles.

BA-64 (4x4)

Armament.....One 7.62 MG in turret

Speed.....Surfaced roads - maximum - 50 mph
average - 28 mph
Earth roads - average - 12 mph

Radius of action.....372 miles

Remarks - This light armored car was produced during World War II. It is the most recent armored car known to have been produced by the Soviets.

MISCELLANEOUS

FIRE-CONTROL DEVICES - GENERAL

The Soviets do not appear to have developed any outstanding types of fire-control equipment.

The various fire-control systems in use by the Soviet Army at the end of World War II represented slight improvement over the systems of World War I.

The Soviets have developed a good system of sound and flash recordings. They have employed this system much more than the United States.

Conventional artillery slide rules, proportional scales, wind rosettes, and other plotting instruments, common to all artillery units, are employed.

In the last analysis, it is considered that the delivery of fire by the Soviet Artillery is complicated because of the actual limitations of the devices themselves. These limitations make necessary detailed reconnaissance of the fire mission and require forward observation posts manned by experienced artillery officers if accurate fire is to be delivered. This would explain the Soviets' seeming disregard for human life and materiel in sending scouts and observers into dangerous forward areas. In addition, the quality of fire-control equipment might partially account for the close-up employment of the artillery. In over-simplifying their fire-control system, they actually have complicated the accurate firing of the gun in combat; whereas, although U.S. fire-control systems appear complicated, the accurate combat firing of the pieces is simplified.

All modern German fire-control equipment is available to the Soviets.

Mortar

Soviet mortar sights function similarly to those of the United States. Small range finders are used in the fire-control of the mortars. To date, no Soviet mortar sight has been reported employing the back sighting principle of the United States M6, which allows the placing of aiming stakes to the rear of the piece.

Field Artillery

Field artillery on-carriage fire-control equipment is designed for both direct and indirect laying. The systems in use are copies of French and German devices, and neither is considered comparable to present-day United States sights.

The two systems in use are: 1) a copy of the French designed Schneider quadrant sight. This sight was adopted by major powers in World War I. This type of sighting materiel was abandoned by the United States Army

2063

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

around 1928, but it is believed to be widely used by the present-day Soviet forces; 2) a copy of the German-designed "match the pointer system", basically a sight of German design adopted by the United States and other major powers at about the end of World War I.

Antitank Sights

To date, three systems of antitank sighting have been identified on Soviet pieces. They are all of French and German design and do not appear strictly modern.

By far the most common type of antitank sights encountered are the simple antitank and/or machinegun type dial sights, which have been identified on all 45mm and 57mm weapons. These sights permit only direct firelaying; any other type of fire undertaken by these sights would be exceedingly inaccurate.

In the heavier class of antitank materiel, as represented by the 100mm antitank gun M1944 and the 85mm antitank gun, the German "match the pointer" quadrant sight is employed.

Antiaircraft Sights

A reflex sight, designed in 1939 for the 37mm antiaircraft gun M1939, appears to be the basic design for the light antiaircraft guns of the 25mm, 27mm and 40mm class. Several varieties of this sight exist, but they all operate on the same principle. The sight is designed for direct fire against air and ground targets.

With the 76mm and 85mm antiaircraft guns, an independent elevation sighting line (the line of sight can be directed onto the target without moving the barrel) is employed. It is constructed as an indicator sighting system and allows following the target in elevation by means of a sighting linkage. This device is employed for ground roles in addition to its antiaircraft work. For antiaircraft roles, this device is considered very crude and incapable of delivering accurate antiaircraft fire.

Directors

Although several obsolete Soviet directors were known to exist, only the Puazo 2 and 3 are deemed worthy of note. Both of these are believed to have been copied from instruments brought forth by Skoda. They function on the linear-speed principle, in that for accurate fire to be delivered by them, the target must travel a course that is straight, at the same altitude, and at the same speed during the time of flight of the projectile.

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Gun-Laying Radar

Although, according to German intelligence, the employment of antiaircraft fire-control radar was a part of Soviet Army doctrine during World War II, it was the great exception rather than the rule for fire-control radar to be employed. The Soviets did receive from the U.S. and the U.K. during the war the following fire-control radar: SCR 268; SCR 547; SCR 584; 282 gun laying set, U.K. GLIII, gun laying set, U.K: and Mark III.

Range and Height Finders

Soviet range finders can also be used as height finders and are used in this dual role by field units. It is believed that the Soviet height and range finders function quite like United States materiel.

Other Fire-control Devices

In the line of other fire-control devices, the Soviets employ devices that are deemed quite similar to those of other nations of the world. Conventional hand periscopes, battery commanders scopes, aiming circles, field glasses, alidades, transits, compasses, and sound and flash ranging stations and systems are employed.

ENGINEER EQUIPMENT - GENERAL

For the most part, engineer equipment is of crude manufacture. In certain categories, however, notably mines and floating bridges, the Soviets have shown marked ingenuity in the development of equipment that compares favorably with any United States or British type. Because Soviet engineer troops do not receive engineer equipment on a broad basis of issue, many of their engineer tasks are performed by hand labor supplemented by whatever mechanical aids that may be available.

Explosives and Demolition Equipment

Standard Soviet explosives are similar in type and chemical composition to standard United States explosives, the only difference being in name. Soviet standard demolition equipment includes blasting machines, firing reels and wire, circuit testing equipment, caps, fuze, detonating cord and demolition tools. All this equipment is similar in type and effectiveness to standard United States demolition equipment.

Bridges and Stream-Crossing Equipment

The Soviet Army possesses standard stream-crossing equipment employed in normal stream-crossing operations. The equipment compares favorably with that of any other modern army. Equipment is available for crossing loads ranging from individual soldiers (flotation suits) to 110-ton loads (TMP heavy Bridge Park). The trend in development of Soviet stream-crossing equipment is to simplify the processes of construction and transportation of the equipment.

The Soviet Army has two standard footbridges. Soviet equipment of this type is crude compared with United States types, but will serve the purpose for which it was intended.

Soviet floating bridges are called bridge parks. Several types are used, the majority being in the light floating bridge class. Most Soviet floating bridge materiel can be used not only to construct bridges, but also to construct ferries of the same capacities as the bridges. In many cases, individual portions are used as assault or reconnaissance boats. The existing types appear to be adequate to satisfy the immediate needs of the Soviet Army.

The fixed portable bridges in the Soviet Army are of three types: (1) decked stell - RMM-4; (2) suspension - PVM, LVM and TVM; (3) decked wooden SVM-2. The decked steel bridge is very similar to the United States steel bridges H-10 and H-20; the suspension bridges, which are used in mountainous regions, are peculiar to the Soviet Army; and the portable decked wooden bridge is made of the superstructure of the DMP-42 heavy bridge park. The trend in the development of fixed portable bridges is toward a light-weight steel truss through bridge similar to the

2069

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

British and United States Bailey bridge.

Soviet assault boats utilize outboard motors. Two types of power boats are being used and only general details are known of these boats. The PG or "Half-Glisser" (Half-Glider?) is a light power boat used for towing rafts, reconnaissance, and general river-crossing operations. It is powered by a GAZ-AA four cylinder gasoline engine and has two forward speeds and one reverse. It is made of wood. The BMK-70 is a heavy all-metal motor tug about 36 feet in length. It is also known as the "Glisser" (Glider?). It is transported on a special two-wheeled trailer towed behind a truck. No other details are available.

The Soviet Army uses various types of river-crossing expedients made of materials available at the site. These consist of combinations of various floating materials such as logs, gasoline drums, canvas tarpaulins, and available commercial river craft.

Quantities of German bridging equipment were captured by the Soviets during World War II. It is believed, however, that his equipment will not be standard in the Soviet Army, but rather that the best features of design will be adopted in any new construction which may be undertaken.

Heavy Construction Equipment

The Soviets have several standard pile drivers of various sizes and driving capacities, all of which are portable and used very effectively in the construction of bridges and other engineering works. The Soviets possess a large variety of earth-moving equipment of their own design and manufacture. All types are very similar to standard United States types. Little information is available on the manufacture and use of prefabricated construction materials in the Soviet Army. Under the Lend-Lease program, the Soviets received a small amount of pierced steel planking for use in airfield construction.

Electrical Equipment

Soviet electrical equipment consists of a variety of electric generators, etc, which for the most part are very similar to standard United States equipment.

Mechanical Equipment.

Very little information is available on Soviet mechanical equipment. The Soviets manufacture standard models of air compressors, gasoline-powered tools, and portable and mobile workshops. From the available information, this class of equipment appears to be very similar to standard types used in the United States Army.

2070

THIS PAGE IS UNCLASSIFIED

Camouflage Materials

Soviet camouflage practices and materials closely conform to those of the United States. The camouflage materials consist of nets, dummies, paint, and natural materials. The best Soviet camouflage practices often include the use of nets for both personnel and equipment.

Miscellaneous Engineer Equipment

Hand pneumatic tools are similar to standard types used by the British and the United States.

The Soviets are experimenting with a roller device fitted to the front end of a T-34 tank which precedes the tank and detonates all mines it encounters. The rollers are equipped with sheep-foot projections and rotate about a shaft fitted to a steel yoke mounted at the front of the tank. Further technical details of this device are lacking.

From information available, surveying, photographic and reproduction equipment as used by the engineers is similar to types used in the U.S. Army.

The system of water supply in the Soviet Army does not differ very greatly from that used by the U.S. Army. The whole system is a joint responsibility of engineer and medical services.

THIS PAGE IS UNCLASSIFIED

SIGNAL EQUIPMENT - GENERAL

The latest Soviet equipment is a copy of United States Lend-Lease production models and of German equipment. This modern equipment, however, is inferior in quality to its prototype.

At present, according to reports, the Soviets are concentrating on the manufacture of military communications equipment, particularly on receiving and transmitting equipment for motorized troops and armored units.

Radio Equipment

Soviet sets are roughly comparable to Japanese equipment. Little thought is given to reduction of weight, compactness, or the ample supply of spare parts. Consequently, sets often are difficult to handle and to operate. Exceptions are later models which are smaller sets for battalions and companies. They are of light weight and of good quality.

Radio communication lines are now being fitted exclusively with Soviet apparatus such as new receiver and transmitter equipment, efficient short-wave antennae, the new 6 and 9 channel Bodo-radio apparatus. New multiple-channel systems MTP-3 and TRT-1 have been developed.

Soviet direction finding equipment is of outmoded design, although it has fair accuracy.

The organic allotment of radios in a Soviet rifle division is a little over 10 percent of that of the United States infantry division; radio being used as an auxiliary to wire principally in command and artillery fire control nets. Several types of portable and mobile radio sets are used, including walkie-talkie and frequency-modulated sets.

In Soviet tank and mechanized units, the allotment of radios is about 30 percent of that of similar United States units, all tanks and self-propelled vehicles being equipped with transmitters and receivers.

Wire Equipment

Field Telephones. The basic type of telephone instruments now used is the so-called UNA type. They consist of phonic instruments UNA-F-28 and UNA-F-31 used by the regiment, battalion and company, and induction

2075

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

instruments UNA-I-28, UNA-I-31, UNA-I-42, and UNA-I-43 used by higher headquarters.

Switchboards. The Soviet Army still retains some early switchboards of European design, although most of the types now used are of Soviet manufacture.

Telegraphs and Teletype. A line field telegraph unit is used in conjunction with field telephones. Field telephones are fitted for buzzer communication and are probably used widely as a substitute for the telegraph at lower echelons. Above corps level, tape recorders of the Hughes or Baudot types are used. In areas farther to the rear, Soviet-built teleprinters, copies of the Schoren and the Treme, are utilized.

Line Equipment. In infantry units, wire is the primary means of signal communication in all except mobile situations. All-wire circuits are used for major circuits. Telegraph is used extensively for routine signal traffic at division and higher level. Teleprinters are used by armies and army groups. Except in extremely mobile situations, only wire communications are maintained with the rear services and installations.

While the organic wire facilities of the Soviet rifle division are only slightly greater than those of a United States infantry division, they are heavily reinforced for operations.

The standard field wire has two copper and five steel strands with rubber and fabric insulation.

Open wire is used above corps level. It may be copper of 2.1, three, or four millimeters, or, more commonly, iron of three or four-millimeter diameter.

Other Means of Communication

Several different types of signal lamps are widely employed throughout the Soviet Army. Heliographs also are used. In addition to signal lamps, the Sovietsalso employ signal panels, rockets, flares, and aural devices such as whistles and sirens as signal expedients. Pigeons are considered an extremely valuable means of signal communications. They are used in the more temperate regions of the Soviet Union, but not in the Arctic regions, as they are unable to withstand prolonged exposure to low temperatures. In addition to their use for psychological warfare, public address systems are also employed in the command posts of regiments and higher units connected with the command net.

MINES - GENERAL

In the past, war mines of all types were used by the Soviet Army. Every conceivable method of employing mines was utilized. The majority of the types used were improvised, but standard types of mines in all categories have been perfected and are considred to be standard equipment. Mines of all sizes, shapes, weights, materials of construction, type of explosive, type of igniter, with and without booster charges, were employed. Methods of detonation included, in addition to the standard pressure and pull igniters, clockwork igniters, chemical igniters, vibration igniters, and remote-controlled radio igniters. Material of construction included steel, wood, plywood, plastic, cardboard, asphalt and glass. Often a combination of igniter devices was used in the same mine which made handling or removing the mine a delicate problem. The Germans found that the wisest means of dealing with Soviet mines was to blow them in place when encountered.

The Soviets handle mines boldly and cleverly. However, for antitank work, they depend more upon the antitank weapons for the actual destruction of armored vehicles, with the mines used to channelize the direction of attack into the range of antitank weapons.

Among the defensive measures advocated by the Soviet Army, and used by them with success, is the immediate laying of defensive minefields, once an objective is occupied. During World War II, the Soviets made use of hasty minefields as a defense against quick counter-attack much more freely than did the other Allied armies.

Planning for minefield defense systems begins before the operation takes place. Vital avenues of approach are surveyed, and special engineer formations are attached to infantry troops solely for the purpose of laying mines in these areas and along the flanks of the attacking force. These mine laying sections accompany the first echelons of attacking infantry, and carry their equipment along with them on sleds. The sleds may be towed behind tanks, or pulled by the troops themselves.

Each mine-laying team is assigned a mission in advance. Some sections mine the vital avenues of approach, some the flanks of the position, and some are held in close reserve to lay mines in the path of attacking enemy tanks.

The actual laying of the mines begins the moment that the position is occupied, and continues, even under heavy enemy fire, until adequate barriers to attack have been laid. Quite often, the Soviet engineers lay electrically-controlled mines, thus permitting their own troops to move forward again through their own minefields, without the necessity of removing the mine.

The trend in the development of mines by the Soviets will be toward the improvement of existing types, the perfection of non- detectable

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

mines (non-metallic), and the development of induction igniters. Several types of mines that were used most successfully during World War II have been adopted as standard by the Soviet Army.

In addition to the standard mines listed here, information received indicates that the Soviet Army is using or contemplates using the principal types of standard German mines used during World War II. Following is a list of standard German mines which may be employed by the Soviet Army.

Tellermine 35	Wooden Box Mine (Holzmine 42)
Tellermine 42	Riegelmine 43 (R. Mi. 43)
Tellermine 43	S. Mine 35 (S. Mi. 35)
	S. Mine 44 (S. Mine 44)

Antitank Mines

The early days of World War II found the Soviet Army equipped with a number of models of metal-case antitank mines. These included the TM-35 and its later version, the M-1938, which were simple metal boxes filled with block explosives and employing the old model UV pull igniter. The designs of both these mines were abandoned in favor of the TM-41 antitank mine, which contained a cast explosive and the new MV-5 pressure igniter, which made this mine operationally more reliable and safer to use than its predecessors. The TM-39, also used during the early days of the war, was replaced by a later and improved model of the same type, the TMD-40. The TM-39 was a long, rectangular-shaped, sheetmetal box mine using one UV or MUV pull igniter which was activated through lever action by pressure applied to the cover of the mine case.

The Soviets, to facilitate increased production by following simple designs and using materials available in quantity, commenced production of the YAM series of wooden box antitank mines of which the YAM-5 proved to be the most successful.

A new model, the YAM-10, is now in production. Its chief advantage over other mines in this series is that it contains 22 pounds of explosive, approximately 10 pounds more than the next larger Soviet mine.

The Soviets, wishing to produce a compact steel-cased mine which could be transported and employed more safely than any mine produced previously, designed the PMZ-40, which had a separately transported igniter, the MV-3. However, because it required a special igniter which could not be used interchangeably with the common igniters, MV-5 and MUV which were used in all other Soviet mines, the PMZ-40 was not produced in quantity.

2076

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

The latest type wooden box mine used during the war was the TMD-B, which contained an increased amount of explosive and was the first wooden mine to employ the now highly reliable MV-5 igniter. To eliminate enemy detection as much as possible, the TMB-2 antitank mine was produced with a bitumen impregnated cardboard case. The only metal in this mine was the MV-5 igniter.

THIS PAGE IS UNCLASSIFIED

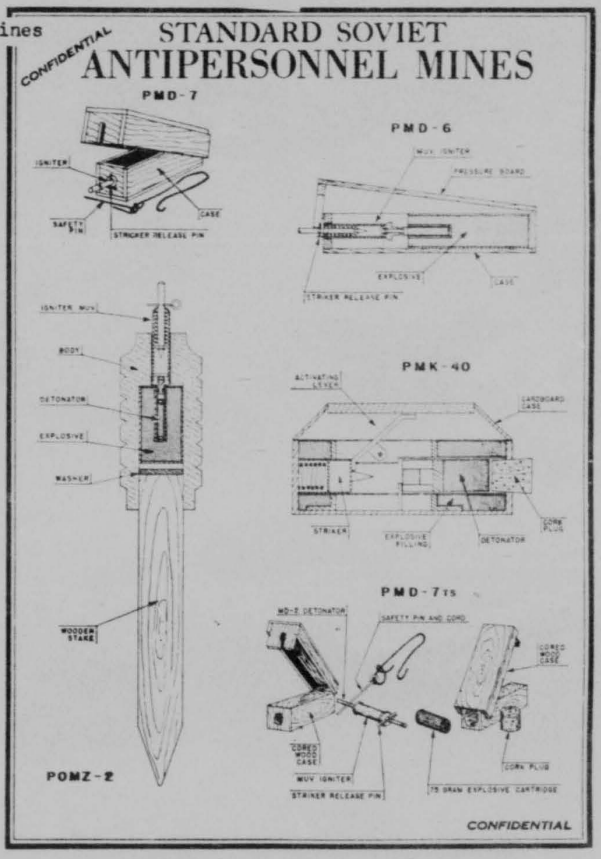
Antipersonnel Mines



The Soviets have only a limited number of types of standard antipersonnel mines, the majority of antipersonnel devices being in the nature of booby traps, which are largely improvised. The first antipersonnel mines to appear during World War II were the PMD-6 small wooded box mine and the POMZ-2 shrapnel stake mine. Both of these appear to have been patterned after standard German antipersonnel mines. Later versions of the PMD-6 were the PMD-7 and the PMD-7ts, which were much smaller than the PMD-6 and contained only 75 grams of explosive.

The smallest operational antipersonnel mine used by the Soviets was the PMK-40, called the "Shoe-Polish Can" mine because of its size and shape. All the standard Soviet antipersonnel mines employed the MUV igniter, with the exception of the PMK-40, which had a built-in igniter.

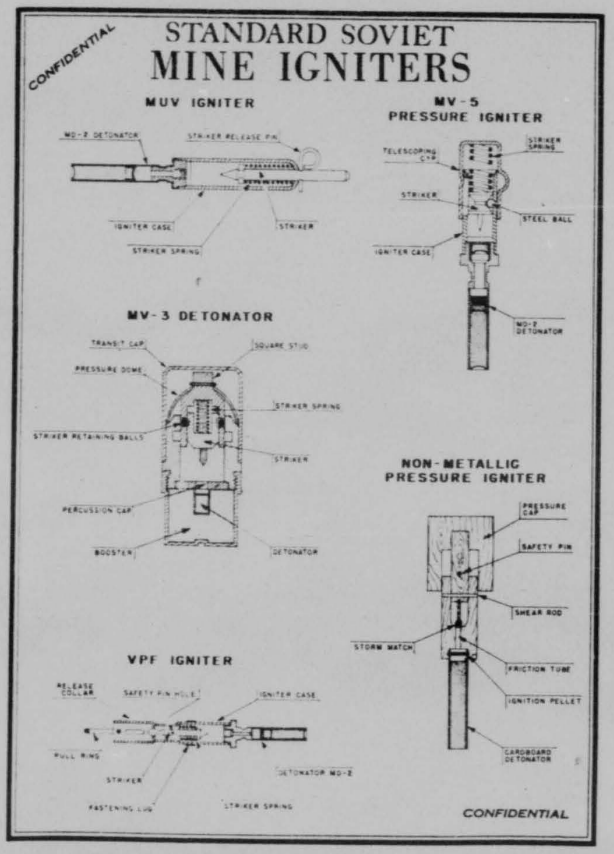
THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Mine Igniters



The Soviets employ several types of igniters in their mines and explosive charges. Standard types include: The MUV (Modernized Simplified Igniter) pull igniter; the MV-5 pressure igniter; and the VPF pull and tilt igniter. All of these are made of metal, have spring-actuated strikers, and use the MD-2 detonator as an integral part of the igniter.

A wide variety of special types of igniters used by the Soviets include: Time-delay types, operated by chemical action; vibration igniters, which are activated by passing vehicles; electrical igniters, operated by the closing of an electrical contact; and clockwork igniters, which detonate a mine after a predetermined period has elapsed. Many models of each of these types exist in the Soviet Army.

CAVALRY

General Tactics

In Soviet terminology, cavalry means horse cavalry. The cavalry arm is numerically of relatively secondary importance now, but cavalry is still considered to be a powerful force for decisive operations in suitable terrain. Cavalry doctrine takes into account the special capabilities and vulnerability of horse cavalry and envisages cavalry units as balanced combat teams with adequate supporting elements. Large units, a corps and more, were used during World War II in making flanking and enveloping attacks. Sizable forces made raids through more lightly held sectors of the enemy line deep into enemy rear areas. The Soviets also employed small cavalry units for reconnaissance purposes.

Organization

1. Cavalry Corps. - The Cavalry Corps is the normal operating cavalry formation and consists of three cavalry divisions, two to four tank regiments of 41 tanks each, a medium self-propelled artillery regiment, a motorized tank destroyer artillery regiment, a motorized heavy mortar regiment, a rocket battalion, and supporting arms and services. A cavalry corps has sufficient organic transport to maintain all of its components for 5 or 6 days of moderate combat.

2. Cavalry Division. - The Cavalry Division normally forms a part of a cavalry corps. It may be independent. A cavalry division is a formation which is designed to perform one phase of an operation, such as an encirclement, pursuit, or a raid. A cavalry division consists of headquarters, three cavalry regiments, a mortar-artillery regiment, a light antiaircraft artillery battery, and supporting arms and services. It lacks the antitank battalion normally found in other formations of comparable size. Its mortar-artillery regiment is singular in that it has no battalion organization, and that it consists of three 76mm batteries, and two 120mm mortar batteries. Services of the cavalry division are small. Its maintenance and resupply facilities are sufficient to maintain it for only 1 to 2 days of moderate combat. It has no replacement pool.

3. Cavalry Regiment. - The cavalry regiment is normally a part of a cavalry division. However, cavalry regiments may be attached to other formations for reconnaissance, or they may act as independent units for specific missions such as night raids. A cavalry regiment consists of headquarters, four cavalry squadrons, and supporting arms and services. The proportion of cavalry proper to the supporting arms and services is less than 50 percent, a much smaller ratio that the proportion of infantry to other arms and services in a rifle regiment. A cavalry regiment is strong in automatic and antitank weapons. In comparison to a rifle regiment, it is weak in mortars.

THIS PAGE IS UNCLASSIFIED

The USSR is reported to have produced in quantity the following chemical agents:

Mustard Gas

Nitrogen Mustards

Lewisite

Adamsite

Phosgene

Diphosgene

Phosgene Oxime

Hydrogen Cyanide

Chloracetophenone

Diphenylchorarsine

Cyanogen Chloride

Chloropicrin

Knowledge of the new, highly toxic German nerve gasses acquired during World War II has undoubtedly resulted in studies of these compounds from the standpoint of manufacture, dissemination and protection. These nerve gasses are extremely toxic, synthetic organic chemicals which have great potentialities as chemical warfare agents. The United States-British designations GA, GB and CD have been applied to the German compounds whose names were Tabun, Sarin and Soman.

Soviet chemical warfare strategy appears to be retaliatory in nature. All reports indicate that the USSR was prepared to wage chemical warfare had she been attacked with gas, but that the Soviet leaders did not attach sufficient strategic value to gas to justify the initiation of gas warfare. Soviet practices for the dissemination of chemical agents will probably include the use of modern artillery, mortar, and small-arms projectiles, tactical rockets, hand and rifle grenades, burning-type candles, aerial bombs, aircraft spray tanks, portable and mechanized chemical agent sprayers, land mines, and possibly guided missiles. Regarding the latter, however, it should be noted that such weapons will probably be capable of efficiently transporting and disseminating clustered incendiary munitions before they can be developed as economical gas warfare projectiles.

TRANSPORT VEHICLES

In 1947 the following vehicles were believed to comprise the range for post-war military purposes.

Truck GAZ-67 - Soviet version of U.S. "jeep". Believed fitted with Ford-type engine.

Truck GAZ-AA - (4x2) Based on Ford Model A.

Truck GAZ-51 - (4x2) Based on Ford 6-cylinder. Known to be used as prime mover for 57mm AT gun M1943, new AT gun (76 or 85mm), and 76mm field gun M1942. Carries a crew of two men in cab plus twelve men in cargo space.

Truck GAZ-63 - (4x4) Is to be the future standard truck of the Soviet Army. Based on Ford 6-cylinder.

Truck ZIS-5 - (4x2) Based on Autocar.

Truck ZIS-150- (4x2) Based on Autocar. 6x6 truck and bus to be designed with this chassis and engine.

Truck ZIS-253 Diesel (4x2) Based on Autocar with GM Diesel engine. A 6x6 truck and bus to be designed with this chassis and engine. Status of production unknown.

HALF-TRACKS

The Soviets have few half-tracked vehicles, in the strict sense of the term. Such types as are known are of prewar origin and obsolete in design. The most widely used has been a modification of the ZIS-5 truck, known as the ZIS-33. This consists of a standard truck fitted with a cross-country attachment composed of a track, driving sprocket, return roller, and two small bogie wheels.

During World War II, Soviets depended on full-tracked vehicles, therefore, the future of the half-track is obscure.

V-Z Half Track

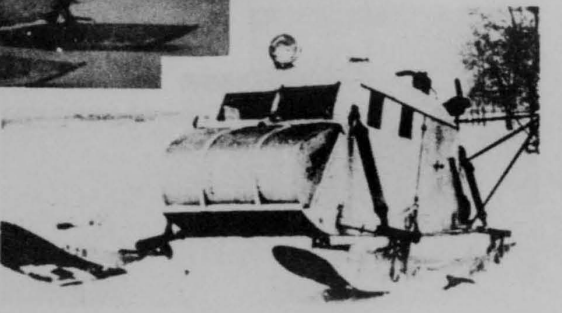
SELF-PROPELLED SLEIGHS

The Soviets appear to have devoted considerable attention in the past to the development of self-propelled sleighs for use in the colder areas of the USSR. These vehicles have lightly constructed, full-enclosed bodies mounted on either three or four runners. Power is supplied by aircraft engines, usually mounted at the rear. Certain of these sleighs have lightly armored bodies and carry one or more machine guns, being designed for cavalry or reconnaissance roles. Other vehicles are used for the transportation of supplies, or the evacuation of wounded. It is reported that speeds of 20 to 30 miles per hour may be attained with loads of from 1,500 to 2,000 pounds.

Lightly Armored Sleigh



Transport Sleigh

Utility Sleigh

LOGISTICS

The combat supply system (Chart - Bottom of Page) of the Soviets during World War II was efficient and economical. Its essentials would probably be duplicated in a future war. Moreover, now that allotments of motor vehicles to units have been greatly increased, the system of higher unit distribution of supplies and equipment may be amended to allow for units below army transporting their own supply requirement.

Supply of units and organizations in the combat zone was organized as follows:

Factories or central storage depots supplying combat echelons, shipped equipment and supplies to front (army group) depots, which were normally located in the vicinity of rail-heads, behind the rear boundary of the command. These depots were large, semi-permanent installations containing several days supply.

From front depots, materiel was sent to army field depots located at various railroad stations in the rear of the Army zone, anywhere from 95 to 125 miles from the fron line. The army depots usually maintained stocks of 1 unit of fire, 3 to 4 rations, and 2 refills of fuel and lubricants for the army, although reserves were increased if protracted offensive operations were in prospect.

Motor transport battalions and companies moved supplies forward from army supply bases.

Supply channels of Soviet Army Regiments, Divisions, Armies and Army Groups (Fronts).

THE SOVIET AIR FORCE

The Soviet Air Force is the largest and most important of the five air agencies (The Long Range Force, The Fighter Defense Force, The Naval Air Force and The Civil Air Fleet), under the Ministry of Armed Forces. Tactical Air Armies, the major operational commands of the Soviet Air Force, correspond in many ways to the tactical air forces of the United States Air Force. Typically, each one is composed of two or more air corps, each corps being composed of two or more air divisions (normally three), with each division usually consisting of three air regiments. All units, up through the air corps, are generally homogeneous, that is, entirely fighter, bomber or attack. Most air armies, in addition, usually control some independent reconnaissance regiments, and occasionally have integral air transport.

Soviet Air regiments are the largest flying units with fixed tables of organization and equipment. They are, however, smaller than the United States Air Force group. A fighter or attack regiment has 42 aircraft, as against 75 in the American group. A bomber regiment has 32 aircraft as against the 48 aircraft of an American A-26 group. By way of further comparison, wartime fighter groups of the USAF called for 952 personnel, and a Soviet fighter regiment at full strength has only 235 men.

This disparity between the two nations in the aircraft-to-personnel ratios of the tactical air units is explained in part by the Soviet logistic and engineering systems - both of which are handled mainly by agencies separate from the tactical organizations.

THE LONG RANGE FORCE (18th AIR ARMY OR ADD)

During World War II, the Long Range Force never did become a true strategic air arm. What slight capabilities it did develop for strategic aerial action were never adequately utilized. No strategic purpose was evident in its operations. Some haphazard night bombing of a few cities, possibly designed to demoralize the civilian population and accomplish some degree of industrial dislocation, was undertaken, but gains were negligible.

At present, The Long Range Force is probably composed of several regional commands or air armies instead of a number of air corps, as it was at the defeat of Germany. It apparently is being re-equipped with B-29 types and capabilities for strategic operations are undoubtedly on the upswing. Although the lack of wartime experience in strategic warfare has a retarding effect on the speed of current developments, a serious attempt is assuredly being made to improve tactics and technique and to equip crews with more suitable aircraft and modern auxiliary air equipment.

THE FIGHTER DEFENSE FORCE

The defense of important political and economic areas under the USSR rests primarily with the Fighter Defense Force. It is a well-integrated

2089

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

organization which maintains administrative and operational control over interceptor fighter aircraft, air warning nets, AAA and subsidiary installations.

The basic unit of the Soviet Fighter Defense Force is the Air Regiment and consists of four squadrons. There is a probable aircraft establishment of 12 operational and two training aircraft per squadron, and Regiment Headquarters has a further six aircraft for its own use. The fourth squadron is a training and reserve squadron to which newly arrived pilots are posted for final operational training.

THE NAVAL AIR FORCE

(See C 6, Navy)

THE CIVIL AIR FLEET

The importance of the Civil Air Fleet stems from the fact that in time of war its units, probably completely militarized, would provide the airlift required for airborne attack and the normal air transport of men and material incident to other military operations.

In the broadest sense, the Civil Air Fleet controls all non-military aircraft in the Soviet Union. It plans and supervises all civil air activities and controls and operates all non-military airfields. (Both as a scheduled and non-scheduled carrier, it handles large quantities of passengers and freight on a rapidly growing network of domestic and international air routes. Actually, it is the Soviet Union's state air line.)

Although most of its aircraft are DC-3 types, a more modern Soviet twin-engine model is now operational in small numbers, and production has been started on several new four-engine transports.

Normally, a civilian air organization, the Civil Air Fleet is organized along military lines and is similarly run. It is believed to cooperate closely with a planning agency of the Ministry of Armed Forces known as the Air Force of the Air-borne Forces. The obvious purpose of such practices is to facilitate the rapid and painless utilization in wartime of the Soviet air transport force for primarily military functions.

TACTICAL ORGANIZATION

AIR ARMY

The organization and strength of an Air Army varies in accordance with its assigned task and the scope of its operations. No two Air Armies are of the same size and composition; this concept permits flexibility of function to Air Armies assigned to different fronts. It is no longer certain that in the event of hostilities, each air army will be directly subordinated to the commander of the front to which it is assigned.

2090

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

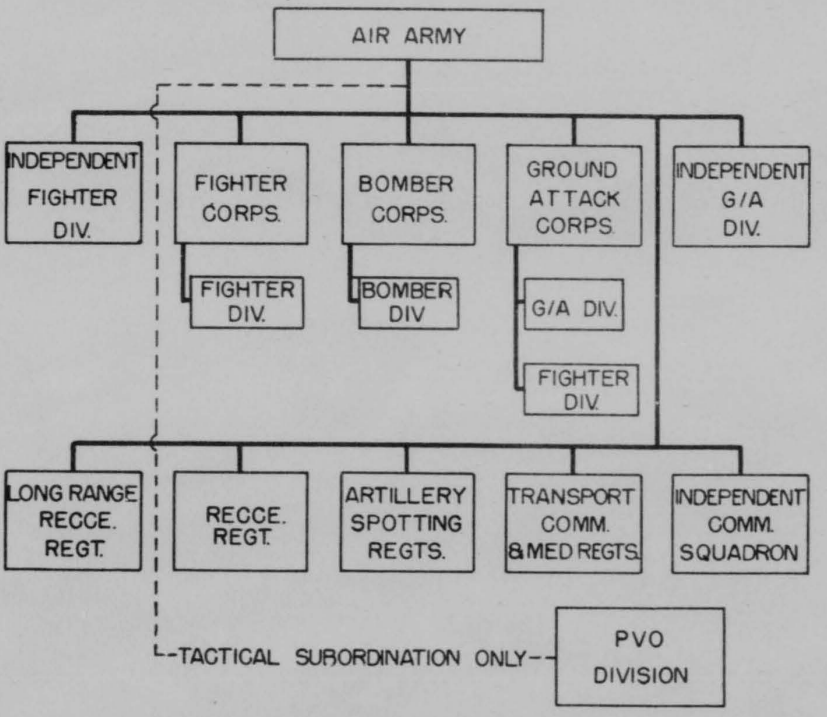
THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Command of an Air Army consists of the Commanding General and four deputies - Chief Deputy, Deputy for Political Affairs, Deputy in Charge of Engineering and Technical Affairs and Deputy for Rear Services. Six other officers serving as assistants to the Commander but exercising very limited command powers are the Chief of Staff, who directs the work of the operational staff, which includes the Operations Department, Intelligence Department, Signals and Communications, Personnel, Cryptography, Meteorology and Chemical Warfare; the Director of Navigation; the Inspector of Flying Training and Aviation; the Director of Aerial Gunnery; the Medical Officer; and the Director of Movements of Personnel and Assignments.

Primary functions of an Air Army, other than the 18th, include participation in preparation for ground attacks, immediate support of attacking ground troops by attacks against the front line or against targets either out of range of artillery or which cannot be observed from the ground, and support of troops which have effected a break-through.

FLYING FORMATION OF A SPECIMEN AIR ARMY



THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

An air corps in the Soviet Air Force is a staff organization controlling both the operations and administrative procedures of two or more divisions. During the war, air corps were created for the purpose of establishing a mobile reserve and providing a means of committing newly formed units. An Air Army requiring reinforcements in an active sector would be assigned one or more complete air corps. As the war progressed, the corps took on a more permanent form. Initially, an air corps headquarters was temporarily assigned to an Air Army, later becoming a permanent fixture.

From the standpoint of operations, it matters little whether the air corps headquarters is a permanent one under the Air Army or one merely subordinated tactically to the Air Army for a limited time and a specific purpose. Effective liaison with the ground army or corps being supported is perhaps the most important task of the air corps.

The Soviet Air Force designates its air corps as fighter, bomber or ground attack types. Originally, there were a number of mixed air corps composed of divisions of different types, but this practice ceased at the close of World War II. Within the past year, however, mixed air divisions have reappeared in some areas.

The air corps headquarters staff closely resembles that of an air army, and is organized on the same basis as a staff of an air division, except that the air corps sections are generally larger. The corps commander has a General Deputy, a Deputy for Political Affairs, and a Deputy in Charge of Engineering and Technical Affairs. All operational departments are under the control of the Chief of Staff and directly subordinate to the Commanding General are the Inspector of Flying Training and Efficiency, the Director of Aerial Gunnery, the Senior Sturman, the Chief of Supply, the Medical Officer, and the Director of Movements of Personnel and Assignments.

AIR DIVISION

The air division is a tactical organization of two or more air regiments assigned either to an air corps or operating directly subordinate to an Air Army. The air division does not operate independently but receives its operational orders from its corps headquarters or the Air Army. Principal responsibility of the divisional commander is to effect liaison with the particular army ground units to which support is to be given.

The Soviet Air Force includes fighter, ground attack, and bomber divisions. Fighter and bomber divisions are almost invariably homogeneous. Normally, a division includes only three regiments, but divisions with four or five regiments have been identified occasionally.

THIS PAGE IS UNCLASSIFIED

AIR REGIMENT

Air Regiments are the largest units in the Soviet Air Force, with a fixed establishment, and correspond closely to the USAF combat group, though smaller in personnel and number of aircraft. Most of the Air Regiments of the Military Air Force are subordinate regiments, and, at present, regimental organization is believed to be as follows:

Fighter Regiment - Three squadrons. (A fourth training squadron may now have been added) 350 officers and enlisted men. 43 aircraft, usually all of the same type.

Ground Attack Regiment - Three squadrons. 250 personnel. 42 aircraft.

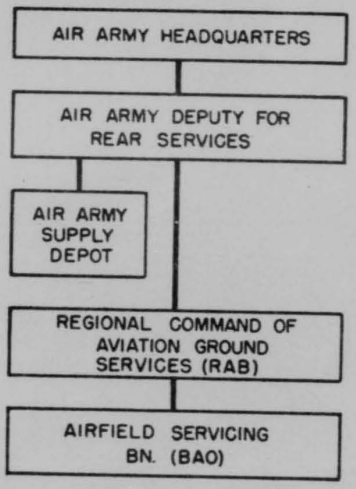
Bomber Regiment - Three squadrons. Usually 350 personnel, though T/Os differ. 32 aircraft.

Independent Regiments - Reconnaissance. (No fixed establishment). Artillery spotting (T/O not known.) Transport, communications and medical. (Usually four or six squadrons of 18 or 20 aircraft each.)

GROUND SERVICE ORGANIZATION - GENERAL

Consideration is given here only to those organizations which service flying units in the field. The main weight of responsibility for supply service to flying units is borne by the Regional Commands of Aviation Ground Services (RAB), and the Aircraft Repair Base (PARB) is the unit responsible for the repair service to flying units.

Supply Service



RAB is a headquarters unit having administrative allocation of supplies control over subordinate units in a prescribed subdivision of an Air Army area. The number of RABs in an Air Army area varies, the average number being 5.

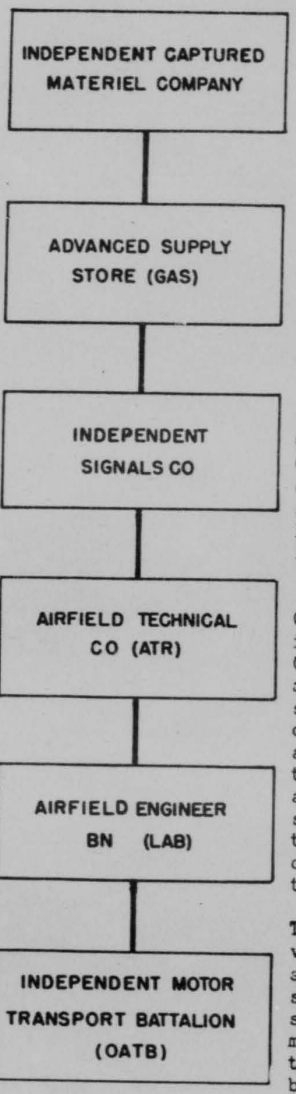
An average of 11 BAO's per RAB. It is subordinate to RAB for administrative and technical matters, but for operations it is subordinate to the commanding officer of the flying unit serviced. Its mission includes casual maintenance of air-fields, furnishing fuel, homes, ammunition, etc., guarding of air-fields and camouflage, provision of transport and transfer of units, weather services, 2 or 3 air regiments. Each BAO has a number of stores, but these hold supplies for only five days and are restocked by the advanced supply stores. (GAS)

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED



Organized into two platoons and a demolition group. Very little is known of the work of such units, but is is believed that their main tasks are probably connected with the location, inspection and removal of both captured enemy air force materiel and damaged Soviet Air Force equipment.

Main function of the GAS is to obtain supplies exclusively designed for use of air units and to furnish them as needed to units being serviced by the RAB.

Attached on a basis on one (1) per division serviced. The Independent Signal Company is responsible for communications within the air regiment and between the units of ground organization.

Operationally, the ATR comes under the CO of the BAO, and for administration under CO of the RAB. Its mission is to carry out large scale repairs on airfield installations and to complete new airfields laid out by the Airfield Engineer Battalion. (IAB)

Only one IAB is attached to each RAB and is responsible for airfield construction. Civilians in the area of a project do the actual manual labor and the IAB does the specialized work incident to airfield construction. The IAB's also repair damaged airfields. It must be emphasized that planning with regard to the location and size of new airfields and the expansion of existing airfields is an operations function and, as such, remains under the direct control of commanders of tactical units.

This organization is responsible for providing motor transport for all transfers and large scale moves of units. It consists of two transport companies and one special motor transport company, plus one motor transport repair shop. As routine transport of supplies is the responsibility of the BAO, the OTAB can be regarded as a permanent reserve attached to the RAB for special transport tasks.

2094

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

A PARB is usually attached to an air division through which it controls its three to five subordinate mobile aircraft repair shops. The PARB is purely administrative in function.

Mobile aircraft repair shops are designated PARM-1 through PARM-5, the figure indicating the number of repair trucks included in the establishment. Each Air regiment ordinarily has one PARM-1, and although the PARM is subordinate to the PARB for administration and technical matters, it is subordinate operationally to the engineer of the air regiment. Main task of the PARM-1 is the execution of minor and running repairs which technicians of the air regiment are unable to handle. Routine servicing of the aircraft is the responsibility of technical personnel of the air regiment.

Consists of approximately 30 railway cars fitted as workshops. No other information is known of the unit.

One SAM ordinarily is assigned to each air army. The SAM is responsible for the repair of aircraft so badly damaged they cannot be handled by the PARM's.

Subordination is unknown, but the SARM's are believed responsible for major repair and overhaul of transport equipment.

The "Letuchki" are reportedly subordinate to the RAB and are attached for their work to BAO's. Each "Letuchki" is equipped with trucks fitted as workshops and presumably deals only with field repairs to motor vehicles.

AIR FACILITIES

Selection - Various reports indicate that the wartime policy of selecting a base airfield - where units are serviced, refueled, and re-armed and then to disperse to a satellite, is still in effect. With supplies concentrated at the base airfield, and an abundance of satellite landing grounds available, the units are then free to make frequent and rapid changes of location.

Construction - During the war the Soviets had no construction equipment comparable to that available to the Western Powers, but they are experts at improvisation and allow no considerations to stand in the way of employment of labor. Virtually no use was made of pierced steel planking and other prefabricated surfaces. The sites chosen were always particularly suitable for airfield development.

OPERATIONAL PROCEDURES - GENERAL

As long as the Soviet Army retains its dominant position in the military hierarchy, it may be assumed that the Air Force will continue to put great emphasis on a tactical air force designed to furnish close support to the Army.

Mission of the Air Force:

Close support of the Army ground forces in all tactical operations. This function will continue to absorb a great portion of the Soviet aircraft and air personnel.

Strategic Bombing: This mission will become increasingly important as airborne weapons of greater power are developed and as the interests of the Soviets more openly assume a global aspect.

Air Defense: It is almost inevitable that the Air Force has assigned a high priority to the perfection of interceptor fighters and defense techniques.

Reconnaissance for the Army ground forces and for the Air Force.

Air lift for airborne troops, other military personnel, and critical military supplies.

Utility and liaison services.

FIGHTER FORCES

Missions (World War II)

During an offensive the principal missions were:

Patrols over enemy forward airfields.
Cooperation with ground forces, and especially with task and motorized units.
Aerial reconnaissance, both visual and photographic.

Secondary missions during an offensive were:

Escort for ground attack and bomber aircraft.
Free-lance patrols.

During defensive operations the main missions were:

Patrol flight and live patrols in the main battle areas.
Escort for ground attack aircraft.
Protection of own forward area.
Photographic and visual reconnaissance.
Free-lance patrols.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Bases - At the time of an advance, the main body of the front line fighter formation was based in a zone 18-20 miles wide, running parallel to and six miles from the main defense lines. The main fighter formation was disposed in accordance with the sectors designed for the projected offensive.

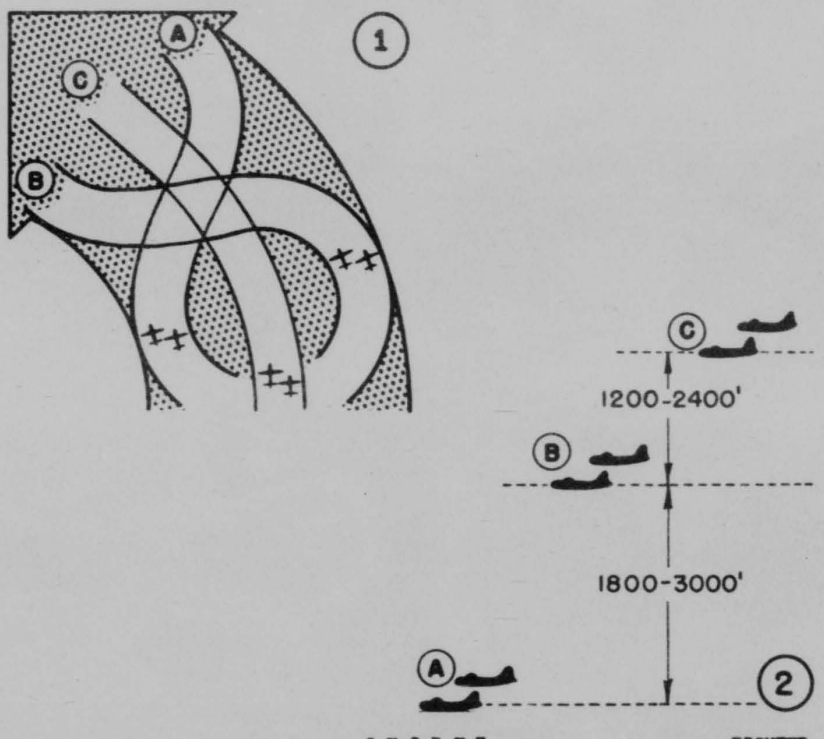
Tactical Formations

The basic tactical unit in the Soviet Air Force during World War II was the "PARA" or pair consisting of two aircraft.

The "GRUPPA" or group was the largest tactical air unit and usually consisted of six and sometimes eight aircraft.

The tactical nucleus of the GRUPPA was the "ZVENO" with four aircraft.

Typical Gruppa Formation



2097

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

The following are examples of altitudes flown by fighter formations on patrol:

Operational Conditions	Heights
Slight enemy air activity	Constant change from 2,800 - 3,500 to 17,500 - 18,500 ft.
Strong enemy air activity or bad weather	Specific height allotted (e.g., 3,500 - 6,500 ft. or 10,000 - 15,000 ft.)
Expected attack by enemy ground attack aircraft	Range of heights between 2,000 ft. and 6,000 - 7,000 ft.
Expected attack by enemy bombers	Range of heights from 15,000 - 20,000 ft.

Radio Communications: It is fairly certain that radio sets were fitted in all fighter aircraft, but air-to-air and air-to-ground transmission was confined normally to the "GRUPPA" or formation leader. The ground control stations kept in touch with the "GRUPPA" and formation leaders only, and orders affecting any aspect of an operation, such as changes in task height, strength of sector, were passed to individual formation leaders by their "GRUPPA" or formation leader. Near the airfields were radar stations which had their own sector of the front to scan, and on picking up enemy aircraft they reported immediately to the aircraft standing by and to ground control stations which took over the control and vectoring of their own airborne aircraft. Towards the end of the war IFF apparatus was installed in a certain number of aircraft.

State of Readiness: A system for stand-to duty, incorporating a series of reliefs, was introduced in the air units committed to protection of the main battle areas. Four GRUPPAS alternated in doing stand-to duty, and, in practice, the system appeared to be as follows:

"State of Readiness 1"	Airborne on operations.
"State of Readiness 2"	On Airfield. Aircraft at full readiness. Pilots in aircraft.
"State of Readiness 3"	Aircraft ready. Pilots at airfield.
"State of Readiness 4"	Aircraft being serviced. Pilots in quarters.

THIS PAGE IS UNCLASSIFIED

Offensive Operations

Cover for Main Battle Areas - During critical situations, operations might tend to be of a prolonged nature, in which case, regimental GRUPPA's operated on a non-stop basis, as explained above in paragraph on readiness. Under normal conditions, a substitute rest interval of 10-40 minutes was given between the landing of one GRUPPA back from operations and the take-off of the next. Multi-layer cover was carried out for large scale operations, or when strong enemy air resistence or attack was experienced. With this type of operations, one sector of the main battle area was given simultaneous cover by several GRUPPAs of different regiments or divisions, the object being to insure complete sector area cover by the disposal of all engaged GRUPPAs at specially allotted heights.

Support of Aircraft covering Main Battle Area - The formations employed on this task were regarded as a reserve fighter force, and, although they patrolled over the actual battle area, the intention was that they should intervene only if the enemy's superiority over the close cover GRUPPAs became obvious. The patrol height varied between 17,000 and 20,000 feet. These formations operated only during an offensive and then mainly at the focal points of operations.

Cover of Forward Area - This operation was a precautionary measure against the contingency of enemy aircraft breaking through the air umbrella over the main battle area and was specially used during the preparation for an offensive. It included - 1) protection of forward airfields against enemy attacks; 2) protection of concentrations of ground troops; 3) protection of troop movements and supply lines; 4) protection of strategic targets such as bridges, river crossings, railway junctions, etc; and 5) interception of enemy reconnaissance aircraft. Cover of the forward area was effected independently of the cover of the main battle area, and embraced a zone 5-60 miles deep running back into friendly territory. Forward area sectors are, as a rule, 2 to 2 1/2 times larger than main battle area sectors. Patrolling above the sectors was carried out mainly by PARAs, unit flying heights determined by the ground control stations according to aircraft type and the height of the approaching enemy. The average height for patrolling was 8,500 to 13,500 feet, with a maximum of 20,000 feet. Aircraft detailed to intercept enemy reconnaissance aircraft usually flew at between 7,000 to 10,000 feet.

Cooperation with Ground Forces - Apart from the ever-present general tactical cooperation of the air force with the ground forces, there was, in addition, a series of special tactical methods belonging to a closer, more specialized form of cooperation. In such cases, fighter regiments and sometimes fighter divisions were tactically subordinated to different arms of the ground forces and proceeded to work with them independently of the general coordinated operations of ground troops and the air force. The control of these aircraft formations lay entirely in the hands of the ground forces to which the air force units were subordinated, and was exercised exclusively in the light of the tasks and interest of the ground forces. This method of cooperation related especially to colla-

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

boration with tank formations aiming at a break-through in depth. Fighters were tactically subordinated to tank formations in order to carry out reconnaissance on behalf of tank spearheads and to afford protection for tanks against enemy air attacks.

Reconnaissance For Tank Formations - Visual reconnaissance in the operational area of the tank units was carried out by one or more PARAs, usually during the early morning or in the evening, or in the case of fluctuating ground situation, several times a day. Data acquired from this type of reconnaissance was normally taken into consideration in preparing a tank attack on enemy formations, and the operation was always ordered by the tank unit commander. In addition, reconnaissance was also called for during an attack and went on continually. A tank spearhead was usually escorted by a PARA of fighters which maintained constant radio communication with the commander of the tank unit from whom the fighters received reconnaissance instructions. The area to be visually reconnoitered was that in which the attack by the tank spearhead was developing and all results were immediately transmitted to the commander of the tank unit. While the attack by the tank spearhead was developing, reconnaissance PARAs continually relieved one another in the air, and the tank spearhead was thus provided with a continuous reconnaissance service during the attack. The flying height of the reconnaissance PARAs varied from very low level up to 6,500 feet, depending on the reconnaissance objectives, visibility and AA opposition. Although reconnaissance PARAs were not escorted by fighters, they received a certain amount of protection from aircraft engaged in cover of the main battle area, or from tank protector fighter formations, and they could, of course, defend themselves against fighter attacks.

Other Aerial Reconnaissance - Nearly all fighter regiments carried out routine reconnaissance work in addition to their other responsibilities. This included reconnaissance of tank and artillery concentrations and movements, airfields, railway traffic, etc., in areas between 20 and 80 miles behind the frontal area, and, to a lesser degree, anti-aircraft and antitank positions, troop concentrations, etc., in the battle zone. Weather reconnaissance was also undertaken.

Escort for Ground Attack and Bomber Aircraft - The following information on escort tactics deals with escort of ground attack aircraft. Escort of bombers is, however, believed to follow similar lines. Escort cover for ground attack aircraft is an important task of the Soviet fighters, and was provided for nearly all ground attack operations. The classic pattern for balance of strengths in escort cover was 1: 1 with the escort fighters split almost equally into two parts - The immediate escort and the assault group.

The immediate escort remained constantly near the ground attack aircraft, flying somewhat higher (300 to 1,000 feet) and slightly behind, in continued criss-cross flight, maintaining normal speed. These fighters entered the battle only when enemy fighters had broken through the

2100

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

forward assault group and were directly menacing the ground attack formation. Over the target they maintained their altitude and stood by just out of AA range to cover the attacking aircraft, resuming their original position for the withdrawal flight. Frequently, in the absence of enemy fighters, the immediate escort attacked AA positions or other ground targets with their own armament. Fighter bombers were sometimes used for the purpose.

The assault group flew 1,500 to 3,000 feet higher than the immediate escort, remaining either directly above the ground attack formation or half to three-quarters of a mile ahead, flying at top speed on a zig-zag course. The duty of the assault group was to prevent any enemy aircraft from reaching the ground attack formation. Frequently, one PARA was sent out well in advance to scout for enemy fighters, while another PARA remained in reserve at a higher altitude, taking full advantage of sun and cloud cover for surprise attacks when the enemy was met. Over the target, the assault group maintained altitude up to 10,000 feet, and patrolled the sky over a contracted area until the ground attack formation completed its duty.

Free Lance Patrols - In comparison with the other tasks of the Soviet Army fighter force, free-lance patrols were relatively rare, the reason being that the fighter types were not suitable for attacking ground targets.

Defensive Operations

Night Fighter Operations - Two methods of interception with the aid of searchlights were employed. The first consisted of merely directing the aircraft into the right area among the searchlights and AA fire. When the enemy aircraft passed out of range of the searchlights, the latter indicated the direction to the fighter by dipping several times. The other method was a system of visual beacons coupled with searchlights. During the approach, orange lights on the ground flared up vertically under the supposed enemy aircraft, and were extinguished again shortly after the aircraft had flown over. Near each orange light a small searchlight of low intensity pointed in the direction the aircraft was flying until the latter reached the next beacon zone. In addition, a more powerful searchlight in the distance showed the general direction in which the enemy aircraft was moving.

Sometimes fighters cooperated with other aircraft, which dropped flares in the path of the enemy bombers. The fighters then endeavored to sight the bombers against the flares.

There is very little information on the use of Soviet Airborne Radar equipment, but it is certain that Soviet fighters were vectored within a short distance of the enemy aircraft by ground control. The main organization of the ground control was on the British and American pattern, using "RUS", "MRU", and "Redut" radar sets and observer corps reports.

THIS PAGE IS UNCLASSIFIED

GROUND ATTACK FORCES

Missions

The ground attack forces were used practically continuously by the Soviet High Command to exert a constant pressure on the main enemy defense line. Consequently, the Soviets called these forces the "Air Infantry," and the ground attack pilots were "the people who do the toughest work in the war." A characteristic feature of the tactical use of the ground attack force was its almost complete independence of weather conditions, and only extremely unfavorable weather caused any interruption in operations.

In Offensive Operations:

Attacks against the main defense lines.
Attack on the enemy's forward area.
Cooperation with the ground forces.
Reconnaissance.
Attacks on enemy airfield.

In Defensive Operations:

Exerting continuous pressure on the enemy's main line.
Attacks on the enemy's forward area.
Reconnaissance.
Free-lance patrols against ground targets.
Attack on airfields.
Sorties "On Call".

Bases

The ground attack regiments were located in a belt approximately thirty miles deep, lying about fifteen miles from the front lines. Dispersal was not so marked as in the fighter force, and it was not unusual for two or three regiments to share the same airfield. Frequently, an airfield contained one ground attack regiment and one fighter regiment for escort purpose.

Tactical Formations

The ground attack units adhered chiefly to two kinds of formation - the echelon to port or starboard, and the blunt arrowhead formation, each of which might contain from four to eight aircraft. The formations adopted were remarkably elastic and permitted a full range of types of attack without loss of time for regrouping. Echelon formation required little maneuvering to become line abreast, line astern, or battle circle. The blunt arrow-head was not quite as elastic, and was, therefore used less frequently. In attacks on area targets, such as definite sectors of the front line, airfields, etc., the frontal run-up (aircraft in line abreast) was used, with the formations attacking in line abreast or in column at very short intervals. In addition, the battle-circle, formed by front-

2102

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

ally disposed formations, was used when several attacks were made on one target. In attacks on line targets (stretches of roads and railway lines, etc.) the aircraft usually attacked in line astern with practically no interval. The latter method was also used for attacking pin-point targets.

The strength of the formations and their intervals depended upon the nature of the sortie, weather conditions, targets, expected enemy reaction, etc., and varied from four to thirty-six aircraft. During continuous attacks by the ground forces on the main defense line simultaneous assaults were made by three or more formations of thirty to thirty-six aircraft each, followed by other similar waves at intervals. Steady pressure on the main defense line was supported by small formations of four to six aircraft, concurrent with mass attacks at break-through points. In defensive operations, steady pressure was maintained by formations of four to twenty aircraft, attacking at frequent intervals. Attacks on the enemy's forward area were carried out mostly by small formations of four to twelve aircraft, usually striking beyond their own artillery zones. Enemy airfields were attacked by formations of eighteen to thirty-six aircraft, sometimes followed by other similar waves.

Target Approach - In practice, approach heights were so variable that it is impossible to classify them. Towards the end of wartime operations the heights most frequently used were lower to medium (2,500 - 8,000 ft.) for the reasons that the numerical superiority of Russian fighters eliminated the necessity for very low level flying and the intensity and success of German light and medium AA artillery.

Low flying was used in some instances to maintain the element of surprise and to confuse the warning system as much as possible.

The run-up to the target was also varied to suit operational necessity such as types of target, caliber of bombs, etc. The aircraft did not alter formation on the run-up, except for a general tightening-up. The direction of the approach was usually predetermined by a previous reconnaissance, and took full advantage of sun, cloud cover, and terrain.

Execution of Attacks - Bombs were normally released at altitudes of 500-2,000 feet in a 30° glide and level-bombing was seldom done. Occasionally, targets were marked by means of a smoke bomb which was dropped by an aircraft assigned this special task. Against area targets, rockets were fired from 1,500-2,000 feet in a 30-45° glide, followed by cannon and machine-gun fire and bombs. Against armored vehicles in column or line, the aircraft armament was fired first, and then, if tracers showed the aim to be accurate, a salvo of rockets followed. The rocket projectiles and their use were similar to those of the Western Allies. The rocket sight was harmonized at 800 yards and the fixed guns at 400 yards. Rockets were not accurate enough to be particularly effective against pin-point targets, but were of immense psychological value.

2105

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Every ground attack formation contained a special sub-formation whose primary function was neutralization of enemy AA fire. These aircraft usually remained behind the larger formation and waited until the enemy opened fire before launching the attack. If, however, the AA positions were known exactly, the anti-flak formation did not wait, but flew in ahead of the main formation and opened fire. If the AA fire was successfully neutralized on the first attack, these units joined in the main attack on the targets. Escort fighters frequently assisted in attacks on AA positions, provided there was no air opposition.

Withdrawal - After attacking their targets, if there were no enemy fighters present, the first aircraft over the target reduced speed upon turning away, while those following increased speed, maintaining direction and climbing; if the enemy fighter attacks were expected, the "snake" formation was resorted to, whereby the leading aircraft maintained speed but flew a zig-zag course at tree-top level to enable the trailing aircraft to catch up; if attacked by fighters, the trailing aircraft endeavored to pair off and employ the "scissors" formation remaining close to the ground. If unable to pair off, each aircraft took violent evasive action, lost altitude, and attempted to overtake the formation. After clearing AA defense areas and reassembling, formation resumed its echelon or blunt arrow-head formation for the return flight.

Evasive Action - Evasion of enemy fire was accomplished primarily by variations of altitude and direction, and by exploitation of cloud-cover, haze and sun. When entering Zone of Fire, the evasion action was executed by increasing the distance between individual aircraft and also between sub-formations in conjunction with vertical and horizontal maneuvering by individual aircraft (independent of one another) or by the whole formation. When attacking the target (in case of several attacks being made) evasive action took the form of changing the flying height of the formation so as to prevent the enemy from finding range. As the ground attack aircraft pulled away from the target the pilot endeavored to fly the aircraft in such a way as to enable the air gunner to open fire at suitable targets.

Cooperation with Ground Forces - As has already been mentioned, the main function of the ground attack units was sometimes tactically subordinated to ground units, although, for the most part, cooperation was controlled by the higher commands, and such subordination was not necessary. For purpose of illustration, the following deals with some highly specialized forms of cooperation, both with and without tactical subordination. Artillery cooperation (without tactical subordination) consisted of combined and coordinated operations by large ground attack formations with artillery preparation during the break-through of the enemy's defense system. During the artillery preparation, which was in the form of "drum-fire" (a prearranged order of fire by artillery prior to ground troop advance) on the first line of defense, large ground attack formations carried out mass attacks on the second defense line in order to destroy it and to deny the enemy the

2104

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

opportunity of consolidating as he withdrew from the first line under pressure of the ground forces. When the first defense line was taken, artillery fire shifted to the second line, while the ground attack forces delivered more attacks on the third and exerted pressure on the enemy's forward area. When the barrage was transferred to the third line, the ground attack aircraft proceeded to attack the forward areas in order to disorganize the retreat of the enemy, impede the movement of reserves, liquidate small pockets of resistance, and destroy his troops and materiel. Ground attack units, tactically subordinated to tank units, which were effecting a deep penetration, stood in readiness on their airfields. They took off when summoned by the tank spearhead commander, who encountered enemy pockets of resistance, which he was unable to overcome without assistance. When the resistance was liquidated, the aircraft returned to base. Cooperation with infantry motorized units, etc., was, in its general methods, similar to the tank cooperation. Here, however, ground attack units played an important part in flank protection as well as in overcoming resistance ahead.

Cooperation with other Arms of the Air Force - With the exception of fighter-ground attack cooperation, whereby the fighters served principally as escort, the ground attack force for the most part operated independently of other air arms.

Free-Lance Patrols - Free-lance patrolling by ground attack aircraft appeared in two forms: 1) Picked crews were assigned sectors of the front in which they could attack targets of opportunity, bringing back aerial photographs as proof of their success. On patrols of this sort, crews usually flew in pairs without escort. 2) Crews were assigned a definite target area for purposes of "policing". Small formations of four, six or eight aircraft were usually employed for this type of patrol duty, and fighter escort was provided. Frequently, some of the escorting fighters were used as fighter-bombers to increase the effectiveness of attack. Two-way air-to-air communication was maintained, and, sometimes, though rarely, air-to-ground communication also. Usually the targets were photographed to obtain confirmation of results.

Reconnaissance - Tactical photographic reconnaissance of targets was carried out by ground attack units to a much greater extent than by fighter units. Visual reconnaissance and verbal reports were regarded as supplementary. Although tactical reconnaissance was mainly accomplished by fighter aircraft for general purposes, ground attack units did nearly all the closer photographic reconnaissance in their own areas, the results of which were passed to superior formation and quite often to ground units to whom they were subordinated, or who might have requested it.

When they had the opportunity before a raid, ground attack units made a practice of sending formation leaders on a sector and target

2105

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

reconnaissance to familiarize them with the targets, the routes and the defenses.

Reconnaissance was conducted continuously. In a raid, approximately one in every six aircraft carried a camera. Small groups of fully armed aircraft executed other reconnaissance; they usually had a target on the enemy's defense line, which they bombed as they crossed it. They attacked small targets in order not to disclose their real objective. With most or all of their bomb load gone, they continued their reconnaissance, attacking any chance target with aircraft armament. Other forms of reconnaissance were carried out on much the same lines as by the fighter reconnaissance units, except that targets were usually much closer to the frontal area. Weather reconnaissance was also undertaken.

Radio Communication - Radio communication between ground attack aircraft was nearly always one-way. Only the formation leader used a transmitter, and, if necessary, his second-in-command, who usually flew last. All other aircraft merely listened, even though they had a transmitter aboard. In a mixed formation of fighter and ground attack aircraft, all aircraft stood by on a common frequency. Although the fighter commander was tactically subordinate to the ground attack commander, he would not hesitate to pass warnings in an emergency. In formations on special missions (reconnaissance free-lance patrols), radio was usually two-way.

Control - The vectoring of ground attack aircraft by ground stations played an important part in the cooperation with ground forces. At the chief control stations near the front lines, fully responsible air force staff officers maintained close liaison between the staffs of army and air force commands, and not only vectored the ground attack aircraft, but also directed their operations according to the situation and to the course of the ground fighting. To prevent any confusion in control, liaison between the chief control stations was particularly close.

The most characteristic function of the chief ground control stations is to direct mass operations of ground attack aircraft in close support of ground forces. The chief control station could at any time change the target, organize the formations in groups for operations against various targets, or mass them for an attack on a single target. They could summon reinforcements, cancel an attack, or stipulate the number of attacks to be made. In addition, they assisted the aircraft in locating the target, advised them of the success or failure of their attacks.

MEDIUM BOMBER FORCES

Missions

The medium bombers of the air armies were employed almost exclusively for tactical bombing, playing an important role in the support of ground operations. The principal missions allotted to medium bombers were as follows: Destruction of troops and material on the battlefield, on the march and in assembly areas; preventing the movement of tactical and strategic reserves; destruction of rail and motor transport; attacking enemy battle headquarters; destruction of fuel, ammunition and supply dumps; destruction of airfields.

Tactics

Support of Ground Forces - In supporting ground operations, bomber units were not usually subordinated to ground units, but a close cooperation was maintained throughout. When a bomber regiment was assigned the task of supporting an army corps, the commander of the bomber regiment, after receiving his orders from the air division headquarters, immediately contacted the battle headquarters of the corps and arranged all details of the operation. During the operation, the bomber commander together with some of his staff officers, stationed himself at the corps headquarters. In addition, liaison officers from the bomber regiment were sent to each division of the ground corps to insure that the operational area was kept under supervision constantly. Radio communication was maintained throughout between the bomber unit commander at corps headquarters, the bomber formation and the division liaison officers. The liaison officers with the front line divisions passed on to the bomber commander the requirements of the ground troops, and insured that the ground troops displayed the proper recognition signals. The allotting of tasks, target data, and the passing of requirements and reports were accomplished from an army map with numbered targets, in accordance with a code selected by the corps commander. These maps and codes were supplied to each squadron commander of the bomber regiment.

In addition to attacking their targets, the bombers carried out frequent reconnaissance, maintaining continual contact with neighboring formations. Special control points, equipped with radio and means for visual signalling were set up 9-12 miles behind the main defense line, and all reconnaissance information was passed through them to battle headquarters. These control points also relayed battle orders from the headquarters to the bomber formation.

Tactical Methods - Bombing was carried out almost exclusively by day. In emergencies, specially selected crews were sent on night missions, but these instances were rare. Bombing was not only restricted to daylight operations, but also to favorable weather conditions required flight through an overcast, as the Soviet bombers were not adequately equipped with blind flying instruments.

Bombing Techniques - Bombing by the Air Army bomber force was usually carried out in straight and level flight. Formerly, some of the PE-2 regiments specialized in dive bombing, but this appears to have been abandoned in favor of level bombing. Occasionally, a few bomber air-

2107

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

craft were known to dive-bomb AA installations, while the remainder of the formation bombed the target from level flight.

Bombing was usually carried out by flights of three aircraft, the formation releasing on signal from the flight leader. Bombing altitudes were always specified at the briefing, and varied according to the location of the targets. Targets in the main battle area were usually bombed from altitudes of 2,500 to 6,000 feet, while those in the rear areas were bombed from higher altitudes, ranging from 10,000 to 16,000 feet. For reasons of safety, the tendency prevailed for formations to bomb from as high an altitude as possible, flying at lower levels only when cloud cover made it necessary.

On the bombing run, the flights usually lost 500-600 feet in altitude, with the result that bombs were dropped in a slight glide rather than in straight-and-level flight. When dive-bombing was carried out, the angle of dive never exceeded 60° for TU-2 type aircraft, although the PE-2 sometimes dived at greater angles.

Formations - Formation was flown in groups of nine aircraft containing three flights of three aircraft each. Each flight and each group were arranged in "V" formation, with the groups flying one behind the other at staggered altitudes. When in the target area, the pilots relaxed and flew very loose formation. Operations were frequently carried out at divisional strength, with four, five, or more groups taking part, each regiment supplying two or three groups.

Defensive Measures - Fighter escort was usually provided, but additional steps were taken to reduce losses. Routes were carefully chosen, and built-up and heavily defended areas were avoided. Courses were changed frequently, and the target approach was made to take full advantage of sun and cloud. Evasive action in flak consisted of variations in altitude and course, with evasive turns limited to 15 or 20 degrees. Generally speaking, defensive measures were inadequate in spite of improvements, and few of the crews had a thorough grasp of their effectiveness.

Control - If the entire regiment, or majority of the regiment, was employed against a single target, the regimental commander had to take part in the operation. Similarly, a squadron commander always led his squadron personally. Control in the air was exercised by means of radio contact between aircraft, and between aircraft and the regimental ground station. During the operation, the aircraft were always in contact with the ground station, but for security reasons all transmissions were kept down to a minimum. Since the radio operator was the only gunner in the PE-2, it was difficult for him to maintain contact when enemy fighters were present. It was customary for the leader only to transmit, and then only as previously instructed.

Blind Bombing - Blind bombing was not carried out, owing to lack of suitable equipment. However, a substitute method was sometimes used, whereby the target was approached from some visible point, and the bombs dropped on an estimated time of arrival over the target. Needless to say, this method was very poor and could only be used against large area targets, and only ineffectively even then.

STRATEGIC BOMBER FORCES

Employment

Due to the exigencies of war, the ADD (Long Range Air Force) completed very few strategic bombing missions, and even these few were poorly planned and executed. The power of this force was used to augment the short range bombing capacity of the tactical air armies in immediate support of the Red Army.

Tactics

General - The performance of the ADD in the field of strategic bombing as understood by the Western Allies was so poor that no useful purpose can be served by discussing what little is known of the procedure and tactics. For the greater part of the war, its work consisted of the night bombing of semi-tactical targets - railway stations, air fields, etc., in the rear of the front line. The following paragraphs summarize the available information on that aspect of the subject.

Raid Procedure - The time of take-off varied according to the time of year, as the object was to cross the main defense line as early as possible after dark (not twilight), so as not to waste any of the dark night hours. The number of aircraft employed on a particular raid was determined by the staff who took into consideration factors such as the number of units available and the type of projected operation. In addition to the main bomber force which carried HE and incendiary bombs, about three aircraft from each regiment acted as target illuminators. There were also a number of observation aircraft in the main bomber stream whose function was the visual checking of the effect of the raid. Special crews followed the main bomber force and photographed the target.

The majority of night raids by the ADD were carried out in weather conditions which did not necessitate any lengthy flight in bad visibility and which permitted good visibility for bombing. Weather conditions ranged from bright moonlight nights, with a varying cloud cover, to dark nights with full cloud cover.

Approach to Target - The target for attack was approached on a course strictly laid down in advance and normally consisting of three or four legs. Changes in course were usually made over characteristic landmarks such as lakes, riverbends, etc., and large towns were avoided for reasons of safety. The ADD had no special type of formation for night bombing, the conventional bomber stream being automatically formed by the lapse of time between the aircraft taking off. Differences in speed of take-off would therefore lengthen or shorten the bomber stream, causing, among other difficulties, dispersion of effort. In 1944, efforts were made to improve the situation by the adoption of a "rendezvous" procedure. This method required all aircraft to proceed to a general assembly area previously defined, and then fly in formation to the target. During the flight, turning points were sometimes marked by flares, though this was not a general rule. At one time, the approach height was strictly laid down, but this practice was subsequently abandoned.

2109

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Height of Attack - Unlike the approach height, the height of attack was always stipulated exactly and any infringement of this order was a punishable offense. The height of attack varied according to the type of target to be attacked, the strength of the target defense system and the type of aircraft employed, but on an average it was between 10,000 and 16,500 feet for targets in the interior and between 1,600 and 6,000 feet for targets in the main fighting zone.

Execution of Attack - The attack was made either by all aircraft from an exactly prescribed direction and height, or in a concentric form at different heights and from several directions.

Target marking was not generally introduced, but attempts were made to mark specific objectives by dropping flare cascades. If a cascade was wrongly placed, a colored flare was placed beside it to warn attacking aircraft. The same type of flare with a different color was dropped to confirm a correct cascade setting.

The HE and incendiary bombs were usually dropped during the first run, a second run being exceptional. However, the target illuminators and photographic reconnaissance aircraft made two runs. Bombs might be dropped above or below cloud, provided the stipulated height was maintained.

Return Flight and Landing - After dropping its bombs, each aircraft flew to a pre-determined departure point and from there on a previously agreed course back to the home base. On reaching friendly territory, D/F bearings were taken on the base D/F station, and on reaching base, permission was requested to land. At least one alternative airfield was given in case of unexpected difficulties at home base. After landing, both oral and written reports were made by each crew.

Navigation and Radio Communications - Navigation was primarily by bearings taken by the aircraft crew. For this purpose, an extensive network of radio beacons both enemy and friendly, was used. Normal broadcasting stations were also probably used. Positions obtained by D/F were probably confirmed by dead reckoning. Some aircraft were known to have requested bearings immediately after bombing, but this could have occurred because of bad navigation, uncertainty about position after action to evade, or enemy fighters and search-lights. There might be definite orders to request bearings immediately after completing an attack in order that the base could check the accuracy of the bombing. However, judging from the frequent bearings given by radio key transmission ground stations were not very reliable, and, judging from the general standard of Russian operators, a bearing taken on an aircraft 600-700 miles away would give little or no indication of the exact position of the aircraft. Air to air traffic was rarely used, but there was considerable wireless communication with various ground stations. During take-off, all aircraft were in a voice radio contact with regimental command posts from which the take-offs were directed, and in the same way radio traffic was used extensively in the landing procedure. Apart from these occasions, traffic was scarcely ever noted, all regular ground communication to and from aircraft being effected by key transmissions in code.

RECONNAISSANCE FORCES

Missions

Reconnaissance over enemy territory.

Weather reconnaissance, which might be a main task or be combined with other reconnaissance tasks.

Terrain reconnaissance was sometimes carried out for the purpose of topographic photography. Specially trained crews were required for this task.

Camouflage supervision was frequently required of reconnaissance crews while on their return flight to check the camouflage of airfield, motor and armored vehicle columns, etc.

Leaflet dropping flights were frequently carried out by the reconnaissance crews as a subsidiary task.

Photography of targets after attacks by the ADD on rear area targets was sometimes carried out. Whether this was done systematically, or only when the photographs taken by the ADD itself were inadequate, is not known.

Targets

Along the Main Battle Line - Only area photographs were taken along the main battle line by the reconnaissance regiments. Reconnaissance of individual targets was generally carried out by the squadrons equipped with fighter or ground attack aircraft.

Behind the Front - Reconnaissance was made of the type, strength, and direction of enemy movements by rail and road; the number and type of aircraft on airfields; railway stations; number, type, and equipment of troops in occupied places; river crossings; defense works, concentrations of motor and armored vehicles; supply depots.

Reconnaissance orders rarely specified one definite type of target. Airfields, railway stations and occupied places specified in the reconnaissance orders were always photographed, but it was left to the crews to decide whether to photograph enemy troop movements which were found, or whether to limit themselves to visual reconnaissance.

The maximum radius of action for strategic reconnaissance was not fixed. The maximum radius of action for operational reconnaissance was approximately 200 miles, and the average radius of action was 125 miles. There was a remarkable uniformity with the individual regiments in this respect, which makes it appear that fixed instructions for the reconnaissance units had been issued. The maximum radius of action of the fighter and ground attack squadrons of the reconnaissance regiments for tactical or battle reconnaissance was 40 miles, with the average 25 miles.

Daylight Reconnaissance

Under suitable weather conditions, sorties were flown daily. The first aircraft took off during the early morning hours and flew weather reconnaissance in addition to its other reconnaissance tasks. The crews which took off later also forwarded weather reports if necessary, giving information concerning visibility, cloud cover, cloud base and ceiling, heights of clouds and direction of cloud movement. Icing and direction and strength of wind were not given. Sorties were flown from dawn to dusk, with emphasis on the morning hours, and take-off times were changed daily, in order to make defensive measures difficult. The route and the altitude were chosen by the crews, and the main battle line was crossed at weakly defended points which changed from day to day. When there was little or no cloud cover, reconnaissance aircraft flew at about 23,000 feet over enemy territory, and targets behind the front lines were photographed from this altitude, but sometimes lower (16,000 ft). Fortified positions along the main battle line were photographed from 13,000 to 16,000 feet or lower. The minimum altitude for photography was 4,000 feet, and below this height, all reconnaissance was visual. Reconnaissance missions were not usually flown if cloud bases were below 1,500 feet, unless the operation was urgent, and area photographs were taken over only the main battle line or directly behind it. These flights were classed as the most difficult, and, therefore only the best crews were employed. If the enemy defensive fire was weak, one aircraft would photograph two or three strips, but where strong defensive fire was expected, several aircraft were sent out in succession, or the same crew made several flights, photographing one strip each time. The interval between the individual flights were also dependent on the enemy's fire, and the stronger the fire, the greater was the interval. The use of two aircraft at a time was very rare. Plans for evasive action against enemy fighters and AA fire were worked out by the individual crews, on the basis of their experience, and the most important defense was considered to be the coordination of the defensive fire with evasive action, which required excellent coordination between the crew members. Machine-gun fire was opened at a range of from 500 to 600 yards. In some reconnaissance units, PE-2's were equipped with RS-82 rockets which were fired to the rear; these were used to ward off fighter attacks at longer ranges (600 to 1,200 yards). If the fighter approached to within 400 yards, AG-2 parachute bombs were used, with which each reconnaissance aircraft was, as a rule, equipped (ten bombs each).

For photo reconnaissance over positions heavily defended by AA fire, the following tactics were employed. The target was approached from out of the sun or clouds, and the aircraft went in on a silent glide with engines throttled down. When the first gun flashes were seen, the speed was increased by diving steeply, and after the aircraft had passed over the target it pulled up with full throttle. The course was not changed over the target, as photography would be made difficult, if not impossible. When unexpected AA fire was seen and the bursts were inaccurate, no evasive action was taken, but if the accuracy improved, course, altitude, and speed were altered. The withdrawal was always flown over a different route from the penetration flight and visual reconnaissance was continued, the Sturman

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

(navigator) entering all observations on his map, and the radio operator making notes. The radius of action of the PE-2 without supplementary tanks varied between 125 and 200 miles, and the average duration of a reconnaissance flight was from 1 3/4 to 2 hours, with the maximum, 2 1/2 hours. The speed of the flight was maintained between 200 and 215 mph.

Radio Communications

Reconnaissance aircraft were in constant contact with their regimental ground station during the mission, from the time of taking off. If contact could not be made, the aircraft returned to base, in accordance with a standing order prohibiting operations without radio contact. For operational reconnaissance, voice radio was used, whereas for strategical reconnaissance, key transmission was customary. The change of call signs and frequencies varied in the different units; in some cases they were changed daily, and in others every few days, though they were always changed after the loss of an aircraft. There was only a single frequency for traffic between the ground station and all aircraft of the regiment. There was a frequency for air-to-air traffic with the fighter escort. The Air Army always listened in on the traffic between the reconnaissance aircraft and the ground station, and the Front Staff and frequently the ground Army Staffs also monitored the wireless traffic. Although it was intended that only coded messages should be used over enemy territory, crews found the procedure too slow, and difficulty was experienced in keeping abreast of the current code. This resulted in the use of plain language throughout, with the exception of weather reports and reports intended only for the regiment. Reconnaissance aircraft transmitted weather reports from time to time until they reached the main battle line, but only important messages were transmitted while over enemy territory. A short summary of reconnaissance results was transmitted in plain language after the main battle line had been crossed on the return flight. The ground station sometimes transmitted a change in orders, or a fighting warning, and the radio operator was, therefore, supposed to be standing by at all times, although it was not always possible, since he had also to take part in reconnaissance observations.

Night Reconnaissance

Night reconnaissance was flown every night, weather permitting. During short nights, the average number of sorties flown was six or seven, but on long nights the number was increased and the same crew frequently flew a second sortie. The aircraft always flew alone, although at times several aircraft took off simultaneously, each with a different task. The crew of the PO-2 for reconnaissance purposes was always two men, pilot, and Sturman.* The duration of a flight varied between one and a half and three hours, and the altitudes varied from 2,000 to 10,000 feet, depending on cloud cover. Both visual and photographic reconnaissance were flown and it is believed that magnesium flare bombs were used for night photography. The camera employed was usually the SAFA-19. No bombs were carried, but frequently, agents or supplies for partisans were dropped, and sometimes landings made behind the enemy lines.

*Sturman -Crew member who is essentially a combined navigator-bombardier-observer with emphasis on the "navigator"

OPERATIONAL AIRCRAFT

Soviet aircraft manufacturers follow the line of simplicity, utility, ease of maintenance, and economic construction, with attention to pertinent and technical detail. The Soviets are capable of high quality workmanship if it is required by the circumstances. The engineering of the Soviet Union shows a tendency to copy existing proved equipment. The time saving policy of producing parts with an inferior finish is everywhere apparent.

The efficiency and performance of the completed item, however, is in no way affected by this lack of precision on unimportant surfaces.

FIGHTERS. JET AND ROCKET POWERED

YAK-15 - Jet Fighter

Power Plant..One Jumo 004B, 1980 lb static thrust at S/L

Performance.....
Climb Time/Alt(min/ft)..18/30,000

Rate of Climb.....900 ft/min

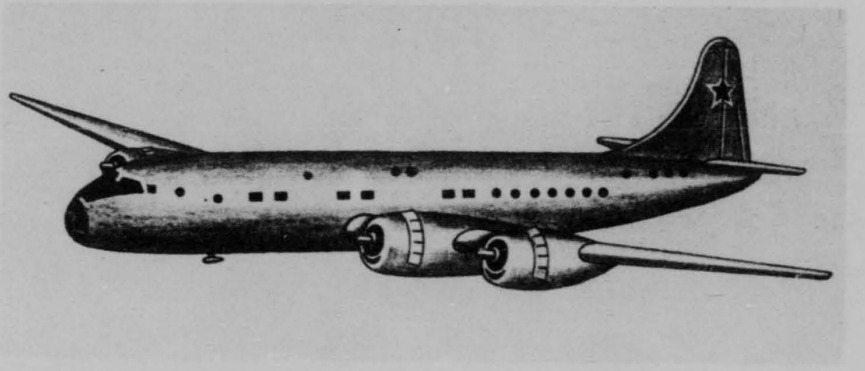
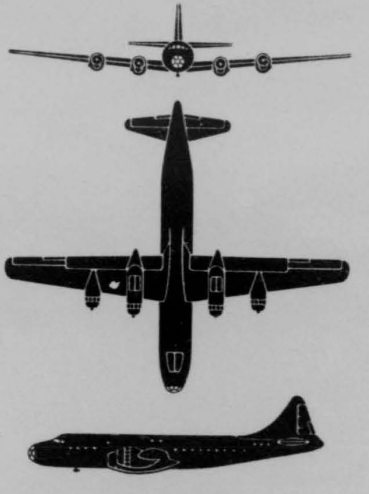
Tu-70 Reciprocating Engine Transport





Power Plant.....

Four, believed to have retained same engines as USSR B-29.

Performance.....
Maximum Speed-Speed/Alt (knots)...
260/SL

Range (nautical miles).....
3,000 with 20,000 lb cargo

Passenger Capacity.....
72 passengers.

Remarks.....

Transport version of the USSR B-29. Has retained the bombardier's nose. It could incorporate an internal bomb bay, which would probably be smaller than the B-29 bomb bay because of the lower wing design.

AIRCRAFT ARMAMENT

GENERAL

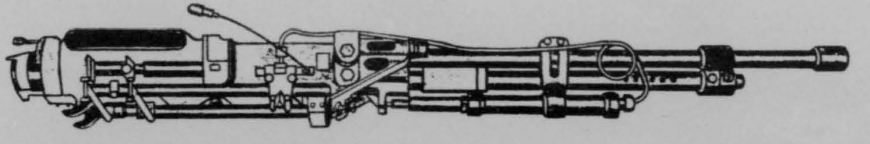
World War II Soviet offensive aircraft armament was primarily installed for ground-support purposes, and this tactical requirement determined the selection of guns and gun arrangements. The fixed forward-firing fighter and fighter-attack type aircraft were usually armed with automatic weapons conventionally installed in the fuselage and wings. In the majority of cases, small-caliber (7.9 and 12.7mm) were combined with large-caliber guns, (20mm and larger) in a single arrangement. In addition to multi-caliber selection, fuselage mounting appeared to be favored over the internal wing gun installation. Where possible, the big gun was mounted to fire through the propeller hub and the small-caliber guns were mounted to fire through the propeller arc, and were therefore synchronized. Provisions for heavy armor were stressed to protect vital aircraft components and the pilot in the ground-support mission. Reliable report by U. S. representatives observing U. S. materiel in the USSR during the war stated that the Russians preferred to remove wing guns where practicable, and to depend on the fuselage installations.

The present estimate of Soviet aircraft armament is based on the assumption that the weapons in use at the end of World War II are still being used. Complete technical details of World War II standard equipment are not available.

GUNS - GENERAL

The USSR is as eager as other countries to possess large-caliber, high performance aircraft weapons. It is probable that the Soviets are investigating the latest German guns. They may be producing some of them already, such as the 30mm MK213, the 55mm MK112, and the 50mm MK214. These three guns are simply constructed and have high performance characteristics for aerial combat.

12.7mm BS (Beresin) Machine Gun



Remarks - Gassoperated, belt-fed.
World War II rate of fire - 800 to 1,000 rpm. (Rate may now be accelerated to 1,000 to 1,200 rpm without much modification.
Weight with pneumatic charger and other accessories - 56 pounds.
Ammunition slightly larger than U. S. caliber .50 round.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

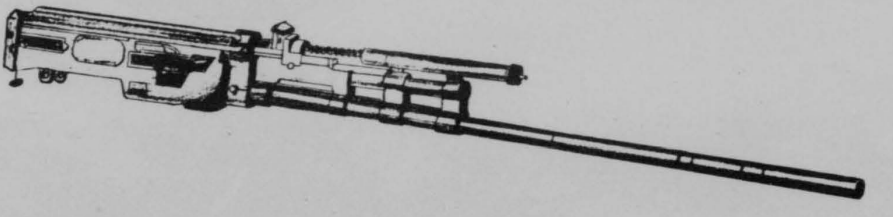
THIS PAGE IS UNCLASSIFIED

Schwak 20mm Automatic Gun

Performance.....About the same performance as U.S. M24, 20mm gun although 88 pounds lighter.
Rate of fire.....750 to 800 rpm, fired at about 2,630 feet per second.
Projectiles.....High explosive-incendiary (HE-I) and armor piercing-incendiary, (AP-I) rounds with about 1,500-grain projectiles usually loaded 1:1 in disintegrating link belts.

Remarks.....Several models of this gun were developed, each for a specific purpose. The models developed included short-barreled, free-firing guns for using installations, a long-barreled version for firing through a propeller hub, a synchronized version for firing through the propeller arc, and a gun suitable for flexible installations.

WJa 23mm Automatic Gun



Rate of Fire.....Adjustable from 370 to 600 rounds per minute - depending on the diameter of the gas orifice.

Weight.....151 pounds

Overall length.....69.3 inches - used in fixed installations only.

Projectiles.....3,055 grain HE-I projectile at about 2,970 feet per second. Also uses AP-I.

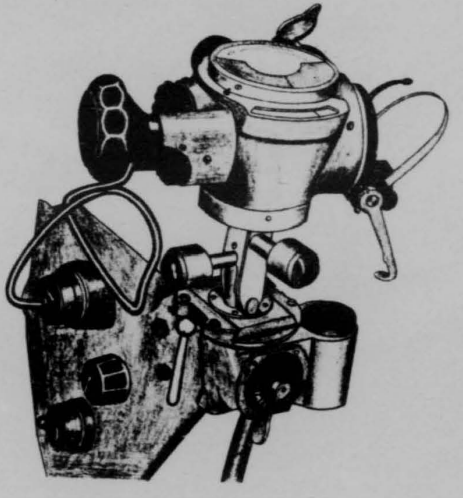
BOMBSIGHTS

OPB-2

Remarks - Used for horizontal bombing. Optical sight copied from the Goery-Bogkow (German). In principle, the OPB-2 is a drift meter with accommodation for range computation. The only means of stabilization is a reference bubble level. It was standard in all Soviet bombers until 1942. Replaced by NKPB-3.

NKPB-3



NKPB-3 Bombsight

Remarks - Used for horizontal bombing. Installed in small quantities in World War II bombers. It replaced the OPB-2. Its operation was based on the impact-predicting principle. The dropping angle was determined from ballistic tables using the prevailing conditions -i.e., altitude, velocity, lateral drift, etc. An automatic pilot was not used; the pilot followed a directional indicator linked to the sight. The target was tracked manually, and when the sighting angle coincided with the dropping angle, the bomb release switch was closed.

2142

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

BOMBS

The Soviets had a standard family of bombs during World War II.

Demolition.....110 to 2,200 pounds

Armor-piercing...440 to 2,200 pounds

Fragmentation.....5 to 110 pounds

Incendiary.....2 to 110 pounds

Rotating Cluster-550 to 2,200 pounds

Chemical.....22 to 1,100 pounds

Flare.....6 to 25 pounds

Photo flash, propaganda and parafrag bombs were available also.

FIRE CONTROL EQUIPMENT

Reports obtained since World War II indicate that the Soviets are exploiting German fire control devices. The Soviets have been credited with complete exploitation of all fire control and bomb control devices obtained from the Western Powers through Lend Lease, surplus sales and technical information released in unclassified publications.

LOGISTICS

The Soviet Air Force maintains two types of centralized rear area stores: Special Air Force Stores, which are stocked with aircraft engines, spare parts, ammunition, and other types of specialized equipment used solely by air force units; and General Stores, from which the air force is supplied with food, clothing, gasoline and other non-specialized supplies.

These central depots in the rear areas are linked through the Air Army Depots with the Advanced Supply Stores (GAS) which are attached to each Regional Command of Aviation Ground Services (RAB). The main function of the GAS is to provide supplies exclusively designed for the use of the air units. The Airfield Servicing Battalions (BAO's) maintain five-days' supplies of various types of stores, obtaining replenishment from the GAS supplies.

Fuel is an example of a type of supply which does not pass through the GAS. Daily reports on the fuel situation in each unit are forwarded by the BAO to the RAB headquarters. Supplies are transported by rail from the Central Stores for Fuel and Oil to the distributing stations, from which the fuel is issued direct to the various ground organization units in the area. The BAO and OATB are responsible for the transportation of fuel from the distributing stations to the airfields.

During the war, the regiments of the air armies obtained new aircraft in several ways. The most common method was for ferrying squadrons attached to the Replacement Air Brigades (ZAB's) to pick the aircraft up at the factories and fly them to the airfields of the subordinate Replacement Air Regiments (ZAP's) which were located relatively close to the production centers. The ZAP's then served as temporary storage depots from which the required aircraft were taken to the front by replacement crews.

Another method employed was for front-line units to fly their aircraft direct from the factory. Although both new type and replacement aircraft were preferably flown to the front, units not actively engaged in operations received appreciable numbers by rail near the end of the war.

Very little information is available on the specific methods employed by the air force to evacuate equipment and personnel of its own and of the Army. It is believed, however, that the Soviet Air Force is at least responsible for the evacuation of its own men and materiel when circumstances require such action.

Soviet statements indicate that hundreds of thousands of Red Army wounded were moved by the Medical Ambulance Squadrons of the militarized Civil Air Fleet.

GENERAL

USSR Naval Policy is dictated by the unique geographical position of the Soviet Union. It differs, of necessity, from that of other powers. The wide physical separation of the USSR's maritime frontiers and inadequate Soviet-controlled water routes between these areas necessitate the maintenance of separate forces together with a decentralized system of logistic support. The present lack of overseas bases is another factor tending to tie each of these separate naval forces or fleets to its respective maritime frontier area. The Soviet Navy is thus handicapped, in that it lacks the strategic mobility enjoyed by other navies.

Under current conditions, it would be virtually impossible to effect a rapid wartime concentration of Soviet naval forces, drawn from the various fleets, in any given critical area. This handicap confers a corresponding advantage on adversaries capable of great flexibility in the strategic deployment of their forces. For this reason, comparative total fleet strength summaries of the USSR and other powers are meaningless, unless the geographical distribution of the former is taken into account.

The Soviet Government has attempted to offset this strategic disadvantage of developing inland and coastal waterways in areas under its control and by building up fleet strength on a planned priority basis, corresponding to its strategic interests. The Stalin Canal, permitting the transfer of destroyers and submarines (in a lightened condition), and lesser craft between the Baltic and Arctic Ocean, and the development of the Northern Sea route linking the Arctic and Far Eastern Fleets are notable examples of the attempt to gain strategic mobility.

Another is the river and canal network of European Russia, which is being developed to permit the eventual shifting of light naval vessels between the Black, Baltic, and Caspian Seas. Even so, possible transfers of naval strength by these routes are time consuming and not immune to damaging attacks.

The regular ocean routes between Europe and the Far East, and European waters linking the three western Soviet Fleets are under the potential control of other world powers. They are available to the USSR only during peacetime, or with the consent of the controlling powers during time of war. In the past, security considerations have induced the Soviet Government to make a minimum use of these routes.

Coastal defense is definitely part of the navy's mission rather than that of a unit analogous to U. S. Coast Artillery, as the Soviets believe that knowledge of naval gunnery is required to fire on floating targets. The navy, therefore, is responsible for the defense of an area fifty miles inland from the coastline.

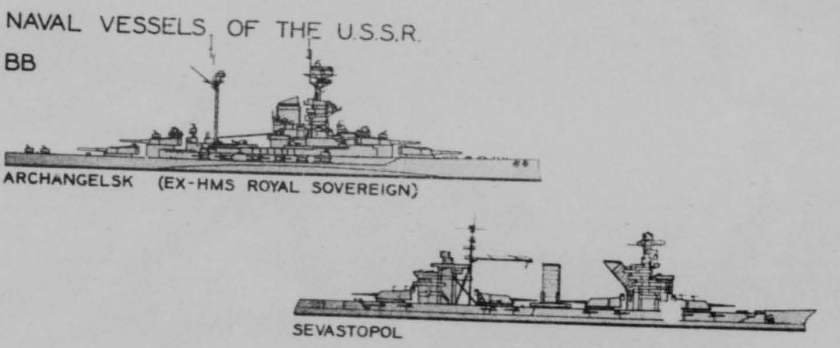
SHIPS

BATTLESHIPS - LK (U.S. BB)



The most powerful capital ship flying the Soviet Navy's commission pennant today is the ARCHANGELSK, formerly the British ROYAL SOVEREIGN. Although obsolescent, she mounts a powerful battery of 15-inch guns and retains residual fighting value as a heavy convoy escort and coastal bombardment unit.

The only other existing Soviet battleships are the three units of the GANGUT class. The GANGUT class was begun prior to World War I and must be regarded as obsolete.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

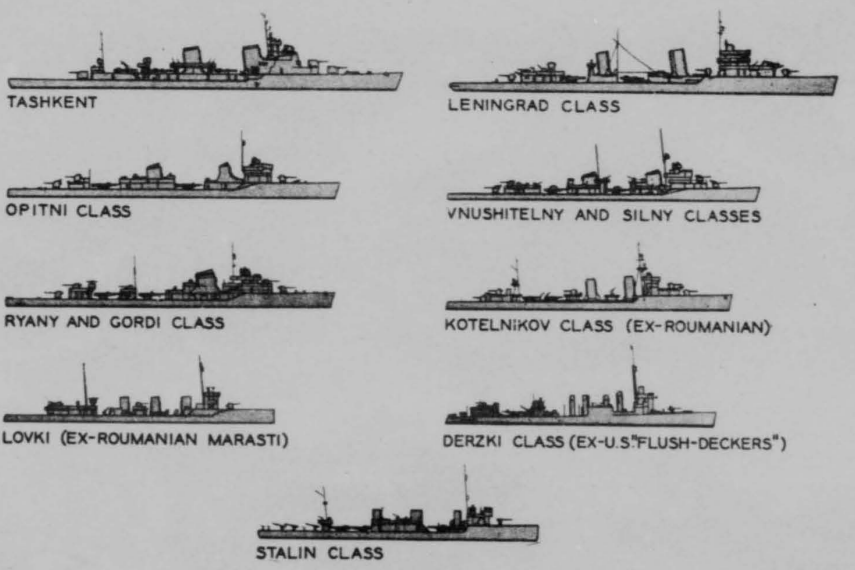
DESTROYERS - EM (U.S. DD)



The largest known Russian destroyer is the Italian designed and built TASHKENT, delivered to the Black Sea in 1939. The TASHKENT is particularly interesting, as her design will probably exert considerable influence on future Soviet large destroyers.

The seven or more units of the LENINGRAD class constitute the balance of the Soviet large or "super" destroyer force. This class has been successfully employed as cruisers, fast minelayers and flotilla craft.

The newer fleet destroyers, the VNUSHITELNY and SILNY classes appear to be standard wartime construction. Often referred to as "improved Gordi's", they combine the machinery arrangement of the LENINGRAD with general design of the GORDI.

Immediately following the LENINGRADS, the GORDI and RYANY classes emerged as the USSR'S second new destroyer design and first group of genuine fleet destroyers. They are very maneuverable, and, although very lightly built, stand up well to the shock of their own gunfire.

The balance of the Soviet destroyer force is made up of older units of limited fighting value.

THIS PAGE IS DECLASSIFIED IAW EO 13526

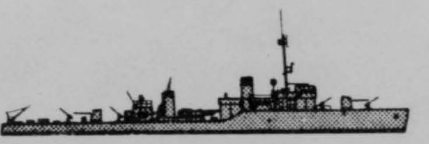
THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

DESTROYER ESCORTS - SKR (U.S. DE)

DZERZHINSKY CLASS

POLUKHIN CLASS



SHTORM CLASS

Four classes constitute what might be termed the Soviet equivalent to the American DE or destroyer escort category. Little is known about the newest design, believed to be either projected or in the earlier stages of construction. Known as the "BIRD" class, these units are said to be very similar to the Swedish NJOELNER class of coastal destroyers in appearance and general arrangement. Next in order of age are the DOLUKHIN and an undetermined number of sister ships. They appear to be a development of the SHTORM class, with better watertight integrity, stability and sea-keeping ability. They are believed fitted for minelaying and minesweeping in addition to their escort and patrol duties.

Best known of Soviet destroyer escort type vessels are the twenty-seven or more units of the SHTORM class.

Oldest of effective Soviet destroyer escorts are the DZERZHINSKY and KIROV designed and built in Italy in 1933-34. They appear to be an escort version of the typical Italian one-stack fleet destroyer, and large enough for independent cruising.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

SUBMARINES - GENERAL

The primary function of Soviet ocean patrol and seagoing submarines would be to attack and, if possible, cut the sea communications of maritime opponents. Some of the seagoing units and most or all coastal submarines may be expected to defend Russian sea frontiers, and, in addition, to engage in reconnaissance, special missions, and supply operations in support of other naval, air, and ground forces.

The USSR has at present a minimum of 271 submarines, of which 169 are in Europe and the Near East (37 in the Arctic area, 81 in the Baltic, 42 in the Black Sea, and nine in the Caspian Sea). By type, these 169 units in Europe and the Near East are comprised of four fast ocean patrol submarines, 65 ocean patrol, 32 seagoing, and 68 coastal defense boats. Maximum estimates for all areas vary from 308 to 360; between 195 and 245 of these units are believed to be in Europe and the Near East.

Known Soviet submarine types do not incorporate such features as Schnorkel, high capacity batteries, or gas turbine engines developed by the Germans late in the war. While some of this equipment could be installed in existing classes, their full benefit can be realized only in boats which accommodate the improvements in their basic design.

Soviet naval construction during the next few years will stress submarines and light combat vessels, with the former being developed and manufactured under the effective German influence. Any increases in submarine strength will be achieved through continuation of the current construction program of standard Russian classes and completion of captured or salvaged German units (primarily in fast ocean patrol type XXI and ocean patrol type VII C). It is estimated that by 1950 the minimum totals mentioned above may be increased by six to fifty-seven fast ocean patrol units, one to fifteen ocean patrol, up to eighteen seagoing submarines, and from thirty to eighty-three coastal defense unit. Most of the latter would be in established Soviet classes, whereas the larger subs would be principally German types.

PL "K" Class - Ocean Patrol Type

Units of this class are the largest submarines yet designed and built by the Soviets. Their design represents an improvement of the "P" class submarines. They are referred to by the Russians as "submarine cruisers" and are believed capable of extended oceanic operations. This class was built between 1939 and 1944.

Dimensions:

Displacement.....1,120 tons (standard)

Length.....282'2" at water line

Beam.....22' 2"

Draft.....11'11" (mean)

Armament:	No.	Size & Type	Max Elev.	Max Range	Max Ordinate	Ammunition
	2	3.9"/51AA	45°	23,300 yd	16,800	--
	2	45mm AA	85°	10,900 yd	5,900	--

6 21" torpedo tubes in the bow

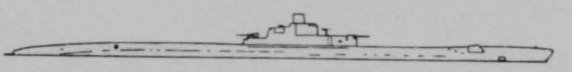
4 21" torpedo tubes in the stern
May carry 18 mines.

Propulsion: Deisgned: 18 knots (surfaced) 4,200hp
8.5 knots (submerged)

Screws : 2

Endurance: 7,000 miles at 9 knots (surfaced)
125 miles at 5 knots (submerged)

Eight 21" submerged torpedo tubes and two 21" tubes above water. Tubes arranged six at bow, four at stern. Total of 24 torpedoes or 20 mines carried. Two periscopes; 1) attack, 2) sky search.



Referred to in the Red Navy as "Submarine Cruisers", "K" class units represent the largest and most powerful submarines built to date in the USSR. They are not large boats by American Standards; nevertheless, they have impressed observers as being well constructed and maintained, though lagging somewhat technologically. For example, considerable wood has been used in furnishing the boats.

The "K" class represents a considerable advance over the "P" type, which it replaces. With a large endurance, well laid out and equipped-particularly as regards stores and accommodations - they appear capable of operating far from their bases. To date, all identified "K" class submarines have been built in Baltic yards.

PL-S Class - OceanPatrol Type

This class represents the standard Russian ocean-patrol and fleet type submarine. Units are considered to be very successful and it is highly probable that construction is being continued. This class was built between 1940 and 1944. Complement comprises 45 officers and men.

Dimensions: Displacement.....750 tons (standard)
1,000 tons (submerged)
Length.....248'10" at water line
Beam.....21'
Draft.....12'6" (mean)

Armament :	No.	Size & Type	Max Elev	Max Range	Max Ordinate	Ammunition
	1	3.9"/51	45°	23,300yds	16,800	200
	1	45mm AA	85°	10,900yds	5,900	500
	4	21" torpedo tubes (bow)				
	2	21" torpedo tubes (stern)				
	2	12.7mm MG				

Propulsion: Designed.....20 knots (surfaced) 4,000 hp
8.5 knots (submerged)
Screws.....2
Fuel.....40 tons
Endurance.....7,000 miles at 9 knots (surfaced)
115 miles at 5 knots (submerged)

Torpedo tubes also reported as four bow and four stern, and six bow and two stern. Some units differ from others in that they have full-welded hull plating of thinner but stronger steel.

Reported to have been built to a German design, the "S" class is generally regarded as the most successful type of Soviet ocean patrol submarine. A good proportion of these boats is believed to have been built at the Sormovo yards at Gorki on the upper Volga River (east of Moscow), whence they were trarsferred by inland waterways to the Baltic and Arctic, while a few are reported to have been floated down that river to the Caspian Sea. They were also built at Nikolaev and in Far Eastern yards; in the latter case the boats may have been assembled from prefabricated parts shipped out overland. More "S" class boats are believed under construction.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

PL "L" Class - Ocean Patrol Type

This design was the forerunner of the "S" class and was intended for the same general duties. The 3-inch guns were not mounted in all the units. It is reported that boats carry 12 torpedoes and 20 mines. Class was built between 1936 and 1941. Complement totals 50 officers and men.

Dimensions:	Displacement	1,100 tons (standard) 1,450 tons (submerged)
	Length	240' (overall)
	Beam	24'
	Draft	13'9" (maximum)
Armament:	1	3.9"/51
	2	3"
	1	45mm AA
	6	21" torpedo tubes (bow)
	2	21" torpedo tubes (stern)
Propulsion:	Designed	14 knots surfaced, 2,900hp 8 knots submerged
	Screws	2
	Fuel	40 tons
	Endurance	6,000 miles at 9 knots surfaced. 110 miles at 5 knots submerged.

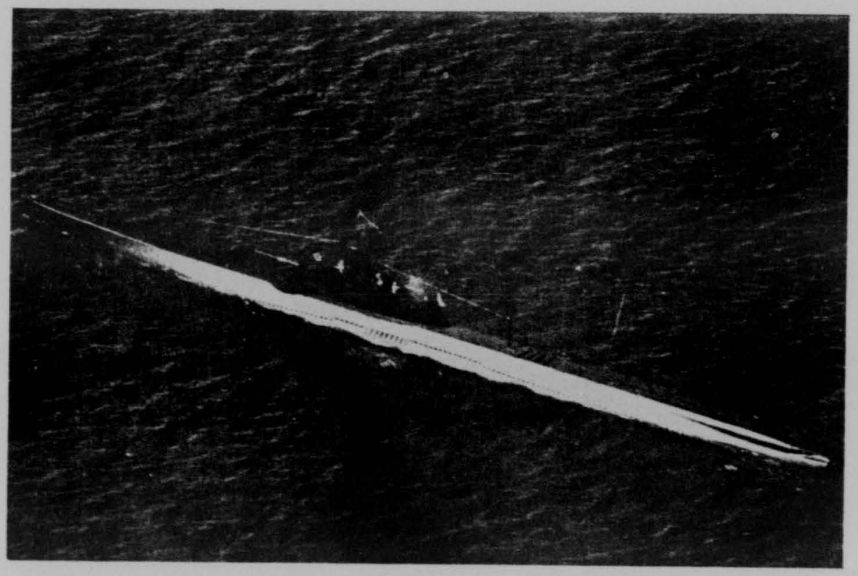
THIS PAGE IS UNCLASSIFIED

The "L-1" class is believed to have been the first group of submarines built in the USSR under the Soviet regime. Reports indicate that their design is based on that of British submarine L-55, sunk off Kronstadt during the Baltic operations of 1919. The L-55 was subsequently salvaged and restored to service in the Red Baltic Fleet. Submarines of this class were originally given names and subsequently numbered "L-1" through "L-6" and "D-1" through "D-6". There may be minor variations in their characteristics, but they were especially fitted as minelayers. The class is now obsolescent, the last units reportedly having been built in 1933-34.

PL"L-2" Class - Ocean Patrol Type



Armament:	No.	Size & Type	Max Elev	Max Range	Max Ordinate	Ammo
	1	3.9/55 AA	85°	23,300 yds	--	--
	1	45mm/46 AA	85°	10,000 yds	--	--

Two machine guns. Eight 21" torpedo tubes; six bow and two stern. Eighteen torpedoes and 20 mines carried.

Propulsion: Drive.....Diesels and electric motors; two screws.

These are a minelayer version of the ocean patrol type of submarine. The origin of their design is obscure, although it might be based on that of the "L-1" class. Contrary to opinion prevailing abroad, it appears that these boats may be contemporaries rather than predecessors of the "S" class, and may still be included in current building programs. They are definitely not sisters of "L-1" class boats. Most "L-2" class boats identified to date appear to have been built or assembled in Far Eastern yards.

2158

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

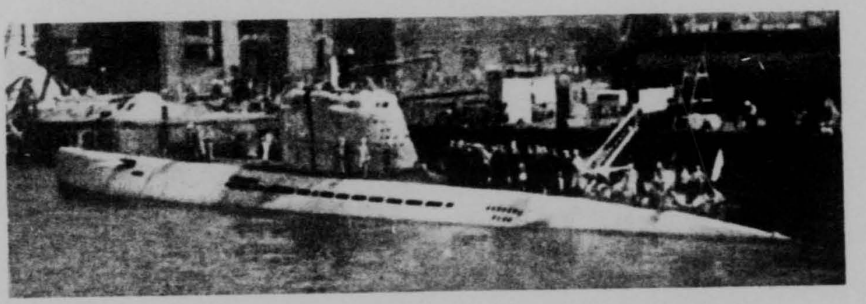
PL Ex-German Type XXI - Fast Ocean Patrol Type



"Type XXI" Submarine

Armament:	No.	Size & Type	Max Elev	Max Range	Max Ordinate	Ammo
	4	30mm Flak 44	90°	--	--	4,000

Six 21" bow torpedo tubes; total of 20 torpedoes carried. Time for reload, 20 minutes; for second reload, 20 mines. Mines: 18 TBM mines or 12 TMC mines may be carried instead of torpedoes. Launched through torpedo tubes. Three periscopes; 1) attack, 2) sky search, and 3) observation.

Fire Control and Electronics:	Radar: Location type for direction and distance of air/sea targets; observation type for directional detection of enemy radar transmission. Hydrophones: Forty-eight receiver units near keel.
Propulsion:	Drive: Two 6-cylinder, 4-stroke diesels, two electric motors and two additional electric motors for "creeping" speeds.
Fuel:	Heavy diesel oil; capacity, 250 tons (max), 228 tons (normal). Fitted with Schnorkel.
Diving depth:	443' (max), 376' (normal)

Characteristics given are those for the original German design; they are subject to modification by the Russians.

In addition to the number of boats listed, the Russians may well have seized an undertermined number of completed sections and sub-assemblies.

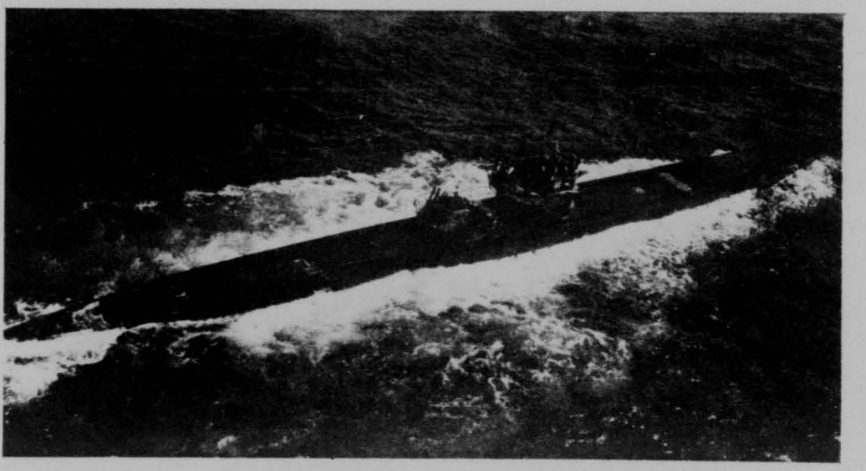
These submarines were designed by the Germans for high submerged speed; accordingly, surface characteristics were sacrificed where necessary. The boats were mass-produced by assembly line methods with plants throughout Germany contributing to the program. The design was not perfect, and because of difficulties, particularly with the hydraulic control system, none of the boats ever made a war patrol. This class will probably form the basis for the Russian development of other high speed types of submarines.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

PL Type IX-C/40 Class - Ocean Patrol Type (Baltic Only)



Armament:	No.	Size & Type	Max Elev	Max Range	Max Ordinate	Ammo
	*1	37mm Flak 42	90°	7,200 yds	9,000	2,600
	4	20mm Flak 38	90°	5,200 yds	12,000	8,500

* Projectile weight of 37mm guns: 1 lb., 6 oz.

Six 21" torpedo tubes; four bow, two stern. Total of 19 (normal) or 22 (maximum) torpedoes carried. Mines: Can carry 66 TMB mines (maximum) with no torpedoes, or various combinations of mines and torpedoes. Two periscopes.

Fire Control and Electronics: Radar: Surface search and radar detection gear. Radio: Extensive long, short and ultrashort transmitter/receiver equipment. Hydrophones: "Balkan type", with 48 hydrophones of 3" diameter.

Propulsion: Drive: Diesel and electric, two each. Two screws. Fitted with Schnorkel. Fuel: Heavy diesel oil; capacity, 214 tons (max), 159.6 tons (loaded), 63.3 tons (normal). Diving depth: 329 feet. Diving time: One minute to periscope depth at four knots. Diameter of turning circle: 520 yds in three minutes, 21 seconds at 20° rudder angle.

This type has also been known as "740 tonners." Characteristics given are those for the original German design, and are subject to modifications by the Russians. Deck armament is known to have varied widely in this design.

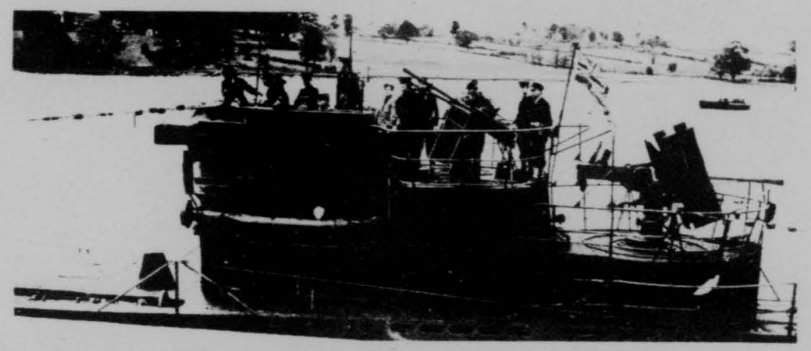
These vessels were conservatively designed and constructed, and, in general, are inferior to comparable American boats. The IX-C boats were fitted with Schnorkel during the latter part of the war.

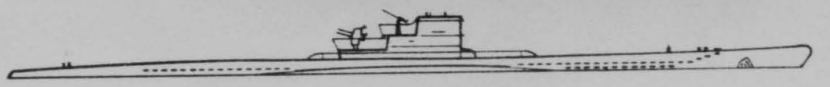
THIS PAGE IS DECLASSIFIED IAW EO 13526

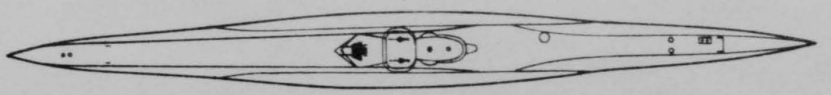
THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

PL Type VII-C Class - Ocean Patrol Type







Armament:	No.	Size & Type	Max Elev	Max Range	Max Ordinate	Ammo
	1	37mm Flak42	90°	7,200 yds	9,000	1,195
	4	20mm Flak38	90°	5,200 yds	12,000	4,380

Projectile Weight of 37mm gun: 1 lb., 6 oz.

Armament: Four bow and one stern 21" torpedo tubes; will carry 12 (normal) or 14 (maximum) torpedoes. Mines: Can carry 39 (maximum) with no torpedoes, or various combinations of mines and torpedoes. Two periscopes; 1) attack; 2) navigation.

Propulsion: Drive: Diesel and electric, two each. Two screws; fitted with Schnorkel. Fuel: Heavy diesel oil; capacity, 113, tons (maximum), 105 tons (loaded)Diving Depth: 309 feet.*

Remarks: Up to around 50 additional German submarines, the majority presumably of the Type VII-C design, may have been acquired by the USSR through seizure or salvage. Individual identity and status are not known at the present time.

* U-1064 has a diving depth of 394 feet, but is otherwise similar to the other boats of this type.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

PL Shchuka (SHCH) Class - Ocean Patrol Type

This class represents one of the most successful Soviet submarine designs evolved to date. Units are well suited to the seagoing operations along Russia's maritime frontiers. Considerable external variations exist in this class, although the basic design is believed similar for all units. Class was built between 1934 and 1938. Complement comprises 40 officers and men.

Dimensions:	Displacement:	660 tons standard 820 tons submerged
	Length:	220' to 225' overall
	Beam:	20' 4"
	Draft:	12' 10" maximum
Armament:	2 - 45mm size, type AA/46 85° maximum elevation 10,900 yards maximum range 5,900 maximum ordinate 1,000 Ammunition 4 - 21" torpedo tubes - bow 2 - 21" torpedo tubes - stern (Torpedo tubes also reported as 6 bow, 2 stern.) 2 Periscopes.	

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

SOVIET SUBMARINE - SHCHUKA CLASS

Propulsion:	Designed:	18 knots surfaced, 1,600 hp 8.5 knots submerged
	Screws:	2
	Fuel:	25 to 58 tons - Diesel oil
	Endurance:	72 hours submerged (Maximum) 5,000 miles or 40 days

It has been reported that these boats cannot fire their forward tubes in one salvo, as the trim of the boat is altered radically. Two torpedoes is the maximum that can be fired per salvo.

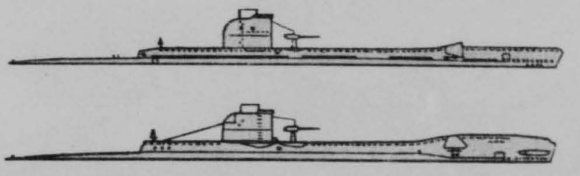
This class includes a numerous series of medium-sized Soviet submarines, built to successively improved variations of the original 1929 design. They have a reputation of being very successful and popular boats, and are supposed to have scored the highest percentage of Soviet submarine successes during the recent war. They are essentially coastal boats, apparently well suited to operations off the Soviet Union's maritime frontiers. None has ever been reported transferred from one Red Navy Fleet to another, except by inland waterway route. More boats are believed to be under construction.

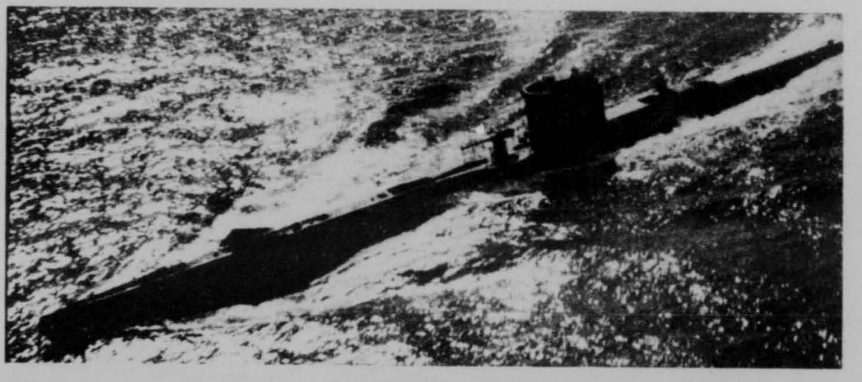
THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

PL Unity Class - Seagoing





Three British submarines, Unbroken, Unison, and Ursula are on loan from the Royal Navy to the Soviet Navy. They are designated as B-2, B-3, and B-4, respectively, by the Russians. They are designed essentially for operations in narrow seas. Class was built between 1938 and 1942.

Dimensions:	646 tons (standard)
	732 tons (submerged)
Length:	196' 11" overall
Beam:	16' 1"
Draft:	15' 2" (maximum)
Armament:	1 - 3" guns
	4 - 21" torpedo tubes (bow)
	8 - 10 torpedoes
	Capable of carrying 6 mines in lieu of torpedoes.
Propulsion: Designed:	11 knots (surfaced) 615 hp (surfaced)
	10 knots (submerged)825 hp (submerged)
Tested depth:	200' (des)
Screws:	2
Fuel:	55 tons

B-4 varies somewhat in appearance. These submarines are on loan from the Royal Navy to the Soviet Navy, and are designed essentially for operations in narrow seas.

2164

THIS PAGE IS DECLASSIFIED IAW EO 13526

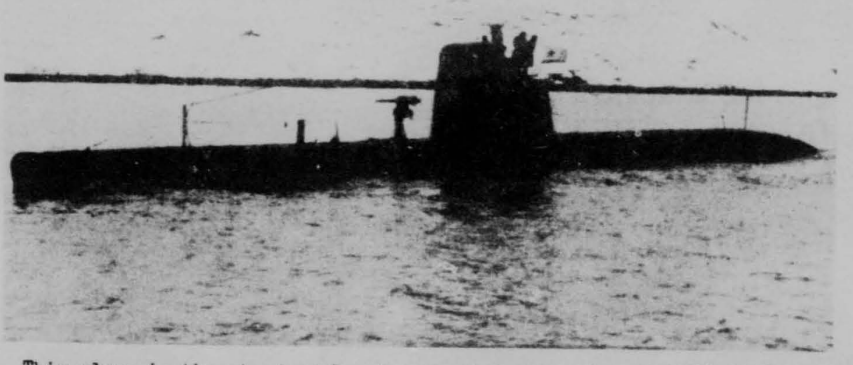
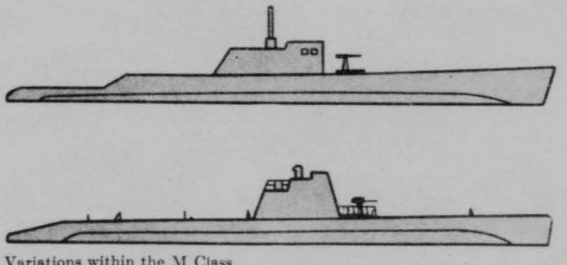
THIS PAGE IS UNCLASSIFIED

PL "M" Class - Coastal Defense



This class is the standard Russian coastal submarine with limited radius of action. A considerable number were constructed. They are the nearest mass produced equivalent to the German 250-ton design. Units are equipped with good air purification systems and air conditioning. The air is excellent, even after being submerged for 16 hours. Class was built between 1935 and 1942. Complement totals 20 officers and men.

Dimensions:	Displacement:	188 tons (standard)
	Length:	142' 9" (water line)
	Beam:	10' 10"
	Draft:	8' 2" (mean)



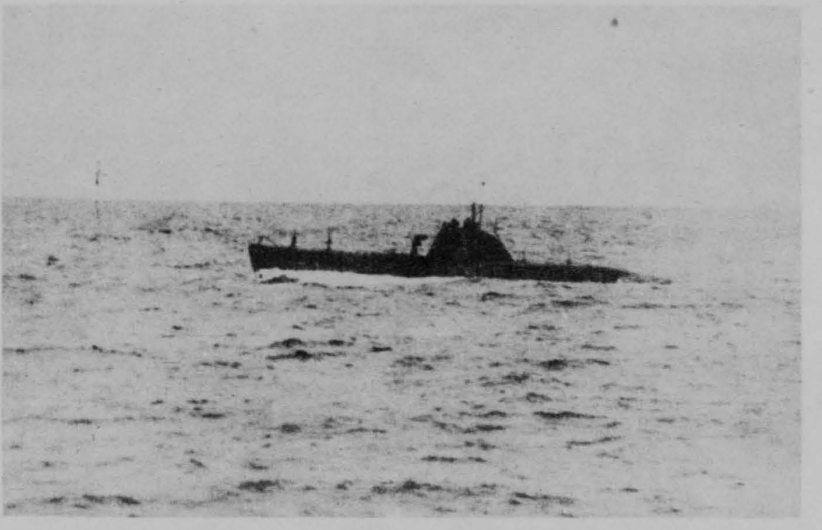
Variations within the M Class.

2165

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED



Armament:	No.	Size & Type	Max Elev	Max Range	Max Ordinate	Ammo
	1	45or47mm AA	85°	10,900yds	5,900	—

Two 21" torpedo tubes (bow); no spare torpedoes carried. No mines. One periscope.

Propulsion: Designed:	14 knots (surfaced), 800 hp (surfaced), 7 knots (submerged)
Endurance:	500 miles. 40 miles (submerged) at 5 knots. Submerged endurance 48 hours (max). Sea endurance 16 days.
Drive:	Diesel and electric, one each.
Fuel:	Diesel oil; capacity 5.5 - 15 tons.
Diving Depth:	197' (max) 164' (normal). Crash dive in 20 seconds.
Diameter of turning circle:	303 yds (surf) and 607 yds (subm) both at 25° rudder angle.

Early units (M 73, 77, 79 and 83) are somewhat smaller and slower. Later units reported to have a cruising endurance of 3,440 miles.

These are small coast defense submarines of limited endurance and offensive power. Built in great numbers and apparently capable of overland transhipment in sections by rail, their value does not appear to exceed that of harbor or inshore defense craft by any appreciable degree. Their war record was not outstanding, considering their numerical strength. Except for the residue of prewar programs, this type may be discontinued in favor of much larger coastal units or a Russian derivative of the German Type XXIII.

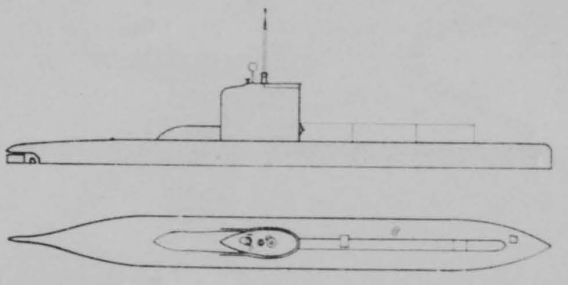
2166

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

PL Type XXIII Class - Coastal Defense



Dimensions: Displacement: Standard: 232 m. tons (surf.)
256 m. tons (subm.)
Full Load: 274 m. tons (subm.)
Length: 114' 6" (oa.)
Beam: 9' 10" (hull) 13' 2" (over fins)
Draft: 12' (mean)

Armament: Guns: None
Two 21" bow torpedo tubes. No spare torpedoes carried.

Propulsion:	Speed (knots)	Endurance (naut. mi.)	HP (total)
Designed (surf)	9.75	9.75	630
Max. sust. (surf.)	9.7	1,350	575
Cruising (surf.)	6	4,300	...
Pres. Max. (subm)	12.5	12.5	550
Economical (subm)	4.0	175	...

Drive: One diesel, one electric motor for high submerged speeds, and one electric motor for economical speeds. One screw. Fitted with Schnorkel. Fuel: heavy diesel oil; capacity, 18 tons (max). Diving depth: 330'.

Type XXIII was the only class of German submarines designed after mid-1943 which actually got into operation. A prefabricated coastal type with a fairly high submerged speed, it was built for Black Sea and Mediterranean duty. The Germans did not consider these boats as a successful design. Their hull shape, patterned for high submerged speed, made them difficult to handle on the surface.

PL Swordfish Class

ILLUSTRATION NOT AVAILABLE

HMS Sunfish, designated B-1 by the Russians, is a British submarine on loan to the Soviet Navy. This boat belonged to the first class of intermediate British Submarines, a prototype for the British "S" class. It was built in 1937.

Dimensions:	Displacement:	768 tons (standard) 960 tons (submerged)
	Length:	208' 8" (overall)
	Beam:	24' 0"
	Draft:	12' 10" maximum
Armament:	1 - 3" gun 6 - 21" torpedo tubes (bow) 12 torpedoes carried. Capable of carrying 12 mines in lieu of torpedoes.	
Propulsion:	Designed:	15 knots (surfaced) 1,900 hp (surfaced) 10 knots (submerged) 1,300 hp (submerged)
	Tested depth:	200'
	Screws:	2
	Fuel:	40 tons

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

ILLUSTRATION NOT AVAILABLE

Among minor combatant types, the standardized mass-produced "T" class minesweepers are the most outstanding. In a displacement of 450 tons standard, their 3,000 horsepower Diesel engines can drive them at 21 knots, making them the fastest minesweepers in the world for their size. "T" class units have also been employed as coastal minelayers, escorts and patrol vessels. Other modern minesweepers include 10 ships of the American ADMIRAL class transferred to the Soviet Fleet under Lend-Lease.

The inland waterway naval forces of the USSR are the largest in the world. A type not generally found elsewhere is the river monitor, an armored, mobile gun platform. The DRASNY VOSTOK class of eight or more Amur River monitors are probably the best known. Displacing 965 tons standard, they mount eight 4.7-inch, 50-caliber guns in twin turrets.

A newer class is believed to be even more powerful; on 1,900 tons they are said to mount four 5.1-inch guns in turrets.

NAVAL AIR FORCES

The Naval Air Force is an integral part of the Navy. It consists of a number of Fleet Air Forces, each of which is operationally subordinate to the surface fleet it supports. Administrative subordination probably is both to fleet headquarters and to Naval Air Force headquarters in Moscow, depending on the matter involved. Supply and maintenance of the navy's air units is provided by fleet and naval air agencies.

The mission of the Naval Air Forces includes responsibilities such as antishipping and antisubmarine attacks, convoy and port defense, support of Soviet amphibious operations, and defense against enemy amphibious operations.

The Naval Air Force is organized in practically all echelons very much like corresponding air army units; the Fleet Air Forces may be considered, in effect, as coastal air armies. Limitations imposed by a complete lack of aircraft carriers will keep naval air units confined to shorebased operations in the foreseeable future. In brief, the Naval Air Force will remain of little or no value in long-range naval warfare but should be effective against targets within operational range of Soviet-controlled areas.

Aircraft Used - The Naval Air Force employs generally the same types of aircraft and equipment as the Tactical Air Armies. Other specialized aircraft utilized by the Navy include the MBR-2, reconnaissance bomber; GST, reconnaissance bomber; KOR-1, reconnaissance; MDR-6, reconnaissance; BV-138 (German), reconnaissance; and the DO-18E (German) flying boat, transport.

LOGISTICS

No information is available as the method of supplying the fleet, except that inasmuch as the Soviet Fleet has been operating close to its shore bases, a fleet train in the American sense has been superflous.

Each fleet area, i.e., the Northern, Baltic, Black Sea and Far Eastern Fleets, maintains such operating bases as are necessary for the refueling, repair and general supply activities.

CONTINENTAL AIR COMMAND DOMESTIC EMERGENCY PLAN, BASIC-1949

SECTION I - GENERAL

1. PURPOSE.

a. To establish plans and procedures for the participation of all United States Air Force commands in domestic emergencies (including disaster relief) and to provide for the implementation of such plans to minimize or end such emergencies. Each United States Air Force installation, irrespective of major air command to which assigned, will participate in planning for and, in emergency or when requested by a Continental Air Command air force commander, will conduct domestic emergency and disaster relief operations.

b. In the event of domestic emergencies requiring employment of air force personnel and equipment, this plan is designed to:

(1) Establish the relationship of the Continental Air Command and subordinate units, with other major air force commands and their subordinate units, with Army areas, with Naval districts, with Coast Guard Districts, with agencies of the Federal, State and Municipal Governments, and with civil organizations which might be concerned.

(2) Standardize planning and operational procedure for all Continental Air Command air forces including all air force installations within their territorial jurisdiction irrespective of major air command to which assigned.

3. DEFINITIONS.

a. White Domestic Emergency Plan or Emergency Plan White is the title most frequently used by Army commands and installations in plans for domestic emergencies and disaster relief.

b. The term Domestic Emergency used in this plan, will include and pertain to the two general types as defined below:

(1) The term disaster pertains to the loss and endangering of civil life and property of pestilence, famine, fire, floods, explosions and other major calamities.

(2) The term disturbance pertains to the loss or endangering of life and property, either government or civil, by local demonstrations, labor actions, racial friction, mutiny and other civil or military disorders.

4. RESPONSIBILITIES.

a. General - The protection of life and property and the maintenance of law and order within the territorial jurisdiction of any state is the primary responsibility of state and local authorities. Intervention with federal troops, pursuant to the provisions of AR 500-50, will take place only after state and local authorities have utilized all of their own forces and are unable to control the situation, or when the situation is beyond the capabilities of state or local authorities, or when the state or local authorities will not take appropriate action, and under such other situations as outlined in AR 500-50.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

b. Army (as provided by AR 500-50 and AR 500-60.)

(1) The Commanding General, each Army Area will be prepared to:

(a) Assist civil authorities in the control of domestic emergencies either in the event of imminent necessity or on order of the President.

(b) Intervene and suppress domestic disturbances wherever such intervention is authorized by law and/or directed by the President.

(2) When domestic emergency activities are undertaken, the Army commander within the territorial limits of whose Army area the affected area is located will assume immediate control of all participation in the relief activities by the Regular Army, Navy and Air Force except such activities occurring on a Navy or Air Force installation. When the catastrophe covers an area included in more than one Army area, each Army commander will assume control of relief activities in his Army area; or, in the event that circumstances warrant, a single Army commander will be designated by higher authority to control the activities. Army commanders are authorized to call upon appropriate ConAC Air Force commanders for such assistance as may be deemed necessary. (See Annex II for ConAC Air Forces and Army Areas of responsibility, and Annex IV for channels of coordination and communication.)

2190

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

c. Air Force (as provided by AF Regulation 23-1, 11 January 1949)

(1) The Commanding General, Continental Air Command has been designated as the responsible Air Force agent in planning for and directing activities concerning domestic emergencies involving the employment of Air Force personnel and equipment in coordination with Army commanders.

(2) The Commanding Generals, Major Air Commands are responsible for:

(a) Directing their Air Force installations to participate in domestic emergency activities as requested by the Continental Air Command Air Force commander within whose area of responsibility the installation is located. (See Annex II, "ConAC Air Force Areas of Responsibility".)

(b) Furnishing such other assistance and information as may be requested by the Commanding General, Continental Air Command.

(3) The Commanding Generals, Continental Air Command Air Forces are responsible:

(a) To the Commanding General, Continental Air Command for Air Force Domestic Emergency activities within their assigned area of responsibility subject to regulations and directives of higher authority and the provisions of this plan.

(b) For evaluating the importance of the current operations being conducted by installations and/or units within their assigned area of responsibility and

2191

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

take such operation in full consideration in making final decision as to the participation required of those installations and/or units in connection with domestic emergencies.

(4) The Base Commanders of all United States Air Force installations are responsible for the safety and defense of their bases and for providing such assistance in domestic emergency situations as may be requested by the Commanding General, Continental Air Command Air Force within whose area of responsibility the installation is located. Such assistance requested by a Continental Air Command Air Force Commander may necessitate the temporary curtailment of the primary mission of the installation and/or unit concerned.

5. **SCOPE:**

a. Section II ("Information") presents the principles for the employment of troops during any domestic emergency situation and the essential substance of the more important laws relating to the employment of military forces in assisting civil authorities. Also included are the applicable policies of the Departments of the Armed Forces.

b. Section III ("Operations") establishes in detail the requirements of the Air Forces in planning for and implementing domestic emergency activities.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

SECTION II - INFORMATION

6. Intervention with Federal Troops: is governed as follows:

a. To aid State authorities at the request of the State. Article IV, Section 4, of the Constitution (See Annex I, Section 1) makes it the duty of the Federal Government, at the request of the legislature of any State (or of the governor, if the legislature cannot be convened) to protect the State against domestic violence. Congress, by Section 5297, Revised Statutes, (see Annex I, Section 2a), has recognized the authority of the President, on such request, to utilize for this purpose such forces of the United States as he deems necessary. (See Annex V, Tab. A).

b. To enforce the laws of the United States within any State. Article II, Section 3, of the Constitution (see Annex I, Section I) makes it the duty of the President to see that the laws of the United States are faithfully executed. Congress, by Section 5298, Revised Statutes, (see Annex I, Section 2b) has recognized the authority of the President whenever, in his judgment, it is impracticable by reason of unlawful obstructions, combinations, assemblages or persons, or rebellion, to enforce the laws of the United States within any State by the ordinary course of judicial proceedings, to utilize such forces of the United States to enforce those laws as he deems necessary. (See Annex V, Tab B.)

c. To protect the civil rights of citizens within any State. The 14th Amendment to the Constitution (See Annex I, Section I) forbids any State to deny equal protection of the laws to any persons within its jurisdiction. Congress, by Section 5299, Revised Statutes, (See Annex I, Section 2c), has provided that whenever insurrection, domestic violence, unlawful combinations, or conspiracies in any State so obstruct the execution of

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

the laws of that State, and of the United States, as to deprive any of the population of that State of rights, privileges and immunities named in the Constitution, and the authorities of that State are unable, or fail, or refuse to provide such protection, it shall be deemed a denial by that State of the equal protection of the laws. Thereupon, it becomes the duty of the President to take such measures, by the use of forces of the United States, as he may deem necessary to suppress such disturbances. No application or request of the State authorities is required.

d. To protect the property of the United States: The right of the United States to protect its property by intervention with Federal troops in case of emergency is an accepted principle of our government. The exercise of this right is an executive function (Annex I, section 1a) and extends to all Government property of whatever nature and wherever located, including premises in the possession of the Federal Government. (Annex V - Tabs C and D). Intervention is warranted where the need for protection of Federal property exists and the local authorities cannot or will not give adequate protection.

e. To protect vital national defense materials, premises and utilities. By Executive Order 8972, as amended, the Chief of Staff, United States Air Force; Commanding General, Military District of Washington; Chief, Army Field Forces; and the chiefs of technical and administrative services are authorized and directed to establish and maintain military guards and patrols and to take other appropriate measures to protect from injury or destruction national-defense material, national-defense premises, and national-defense utilities, as defined in Executive Order 8972, in any case where action is necessary or desirable for such protection.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

7. BASIC POLICIES.

a. The protection of life and property and the maintenance of law and order within the territorial jurisdiction of any State are the primary responsibility of that State. Intervention with Federal troops will take place only after the State has utilized all of its own forces and is unable to control the situation, or when it is apparent that the situation is beyond the capabilities of the State, and when such action is in accord with the Posse Comitatus Act (See Annex I, Section 2f, and paragraph 6d, above).

b. Intervention with Federal troops will take place for the purposes indicated in paragraphs 6a, b and c above, only after so ordered by higher authority. No such order will be issued until after the President has published the proclamation, required by Section 5300, Revised Statutes, demanding that the insurgents disperse and retire peaceably to their respective abodes within a specified limited time.

c. No Presidential action or proclamation (other than the Executive Order in the case of Government seizure of private property, described in paragraph 6d, above) is necessary for intervention with Federal troops for the purposes expressed in paragraphs 6d and 6e, above. Under War Department Memorandum 500-50-1, 25 October 1946, appropriate measures may be taken to protect vital national defense materials, premises, and utilities (paragraph 6e, above) without express instructions from higher authority, unless a labor dispute is involved. In the latter case, instructions must be obtained, through the appropriate Army Area commander, unless damage or destruction is imminent. Measures that may be taken, in addition to establishing military guards and patrols, are those appropriate to the circumstances in order to provide full protection.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

a. In appropriate cases, action may be taken pending receipt of instructions from the appropriate army commander. Paragraph 4, AR 500-50, 17 August 1948, provides, in substance, as far as it concerns this plan, that in case of sudden and unexpected invasion, insurrection, or riot endangering the public property of the United States, or of attempted or threatened robbery or interruption of the mails, or of earthquake, fire, or flood, or other public calamity disrupting the normal processes of government, or other equivalent emergency so imminent as to render it dangerous to await instructions requested through the speediest means of communication, an officer of the Air Force in command of troops may take such action, before the receipt of instructions, as the circumstances of the case reasonably justify. Such action, without prior authorization, of necessity may be prompt and vigorous, but should be designed for the preservation of order and the protection of life and property until such time as instructions from higher authority have been received, rather than as an assumption of functions normally performed by civilian authorities. In such a case, the action taken will be no more than the circumstances require, and will be reported as indicated below in paragraph 13c(2), in order that appropriate instructions can be issued.

e. When intervention with Federal troops has taken place, the military commander will assume charge only to the extent necessary to accomplish his mission. When intervention is under paragraphs 6a, b or c, above, the action will be designed to support, or reinstate and sustain, the civil officials. Action under paragraph 6e, above, will be within the power delegated by higher authority. In the accomplishment of his mission,

2196

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

necessity is the measure of the authority of the military commander. Federal Forces will ordinarily exercise police powers previously inoperative in the affected area, restore and maintain order, maintain the mechanism of distribution, transportation, and communication, and inaugurate such relief measures as the situation demands.

f. The military commander will cooperate to the fullest possible extent with the governor and other local and State authorities and forces. While the military commander is subject to no authority but that of his military superiors, he will bear in mind that the suppression of violence, when accomplished without bloodshed, is a worthy military achievement, and will employ only such force as is necessary to accomplish his mission. The population of the affected area will be informed of the rules of conduct and other restrictive measures to be enforced by the military. These will be announced by all available media.

g. Martial rule, or martial law, will not be proclaimed except by express direction of the President. When martial law is advisable, the Air Force commander will so inform the appropriate Army Area commander.

8. STATE GUARD AND NATIONAL GUARD

State Guard or National Guard troops (not in the Federal Service) cannot be commanded by United States Army or United States Air Force officers except with the consent of the State. Army or Air Force commanders will therefore obtain, wherever possible, written agreements from governors or other appropriate State officials, to assure full cooperation of the State Guard or National Guard (not in the Federal service) with the

2197

SECTION III - OPERATIONS

9. THE AREAS OF RESPONSIBILITY:

a. Numbered United States Armies and Continental Air Command Air Forces are as shown in Annex II. Air Force installations within the District of Columbia are considered under the jurisdiction of the Ninth Air Force Commander for Domestic Emergency Plans and Operations.

b. Naval Districts are as shown in Annex III.

10. CHANNELS OF COMMAND AND COORDINATION are as shown in Annex IV. The inter-Navy - Air Force channels of coordination are not shown on this chart; however, each Continental Air Command Air Force Commander will coordinate and plan jointly (par. 12a) with the commanders of Naval districts and Army Areas whose areas of responsibility are, in part or in whole, within the area of responsibility of the Continental Air Command Air Force Commander.

11. TYPES OF OPERATIONS:

For the purpose of this plan, domestic emergency activities involving the United States Air Force are classified into three distinct types of operations.

a. Operation A - Operations wholly within the limits of an Air Force installation.

b. Operation B - Emergency operations outside the limits of Air Force installations involving assistance to the Army and/or Navy.

c. Operation C - Emergency operations outside the limits of an Air Force installation involving immediate independent action by units of the United States Air Force.

In discussing these types of operations in this plan, they will be referred to as Operations A, B, and C.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

(Note: Air Force plans and operations, under the requirements stated herein, will include the personnel and equipment from all Air Force installations within each Continental Air Command Air Force area irrespective of major air command to which assigned.)

12. PREPARATIONS BY CONTINENTAL AIR COMMAND AIR FORCES

The Commanding General of each Continental Air Command Air Force will:

a. Prepare and maintain a Domestic Emergency Plan for his area. This plan will be prepared in coordination with commanders of appropriate Army areas and Naval districts.

b. Establish and maintain continuous liaison with commanders of appropriate Army areas and Naval districts.

c. Appoint a Domestic Emergency Control Officer, requirements and duties of which are shown in Annex VI.

d. Require the commanders of each Air Force installation within his area, irrespective of major air command to which assigned, to:

(1) Prepare and maintain a Domestic Emergency Plan to include plans for the participation of all units assigned to that base.

(2) Appoint a Base Emergency Control Officer whose duties and responsibilities will be similar to those of the Continental Air Command Air Force Domestic Emergency Control Officer (Annex VI).

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

(3) Simulate local emergency conditions and practice emergency operations utilizing the assigned personnel and equipment thereon in accordance with the existing Base Emergency Plans as the installation commander deems necessary.

(4) Furnish such other information and assistance as may be required by the Air Force commanders

e. Take appropriate action to assure receipt of early and accurate information of events within his area that may result in civil disturbances requiring intervention with air force troops.

f. Make frequent visits to ascertain that the plans and preparations of each Air Force installation within his area are adequate and are in accordance with the provisions of the air force plan.

13. ACTION BY CONTINENTAL AIR COMMAND AIR FORCES. The Commanding General of each Continental Air Command Air Force will:

a. In Operation A

(1) Require the appropriate base commander(s) to place in operation the Domestic Emergency Plan for his base, either on receipt of instructions or in any domestic emergency situation requiring action by the base commander prior to receipt of instructions from the Air Force commander with such variations as, in his opinion, the special circumstances of the situation required. In the latter case, the decision as to when a situation constitutes a domestic emergency, as outlined in this plan, rests with the base commander concerned.

(2) Require the base commander to notify him, by the speediest means of communications available, the full particulars of

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

the situation when the Domestic Emergency Plan has been put into operation or when such operations appear to be imminent.

(3) Make available to the base commander such assistance as may be necessary to end the emergency situation.

(4) Furnish the appropriate Army Commander the full particulars and request assistance if necessary.

(5) Request, by direct communications, assistance from other Continental Air Command Air Forces as required, with an information copy of the correspondence addressed to the Commanding General Continental Air Command.

(6) Render immediate report of any action taken to this Headquarters by the most expeditious means possible.

(7) Furnish assistance to adjacent Continental Air Command Air Force commanders, upon request.

b. In Operation B

(1) Furnish available assistance as may be requested by an Army commander when the Army has been designated by Executive Order as the responsible agent or when the Army has undertaken Domestic Emergency activities. If the entire assistance requested is not available within the local Air Force area of responsibility, additional assistance will be requested by direct communication with other Continental Air Command Air Force commanders, with an information copy of the correspondence addressed to the Commanding General Continental Air Command. If the emergency extends over

2202

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

more than one Air Force-Army Area, but remains under the operational control of a single Army commander or the officer-in-charge (designated by the Army Area Commander or by higher authority) then the Air Force Commander initially designated to cooperate with the Army Commander or officer-in-charge will continue to be responsible for all air force coordination and assistance.

(2) When the Navy has been designated as the responsible agent, similar procedure as outlined above will be followed except that the request for assistance ordinarily will be made through the appropriate Army Commander; however, if the situation is critical and the request is made by direct communication between a Naval District commander and a Continental Air Command Air Force commander, assistance will be rendered immediately, followed by a report of the full particulars to the appropriate Army commander.

(3) Requests for assistance received by ConAC Air Force Commanders from sources other than Army Area commanders or other ConAC Air Force Commanders will be turned over to the respective Army Area commander for action unless the request for assistance comes under the concepts of Operation C as outlined in paragraph 13c below.

(4) Report the full particulars to this headquarters within twenty-four hours after initial action has been undertaken.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

c. In Operation C

(1) Place in operation the Domestic Emergency Plan with such variations as the special circumstances of the situation justify (paragraphs 7c and 7d above), until such time as the responsibility can be turned over to the appropriate Army commander.

(2) Report the full particulars by the most expeditious means possible to the appropriate Army commander and to this headquarters.

(3) Request, by direct communications, from other Continental Air Command Air Forces any required assistance, with an information copy of the correspondence addressed to the Commanding General, Continental Air Command.

(4) Furnish upon call of adjacent Continental Air Command Air Force commanders such assistance as can be provided.

14. ACTION BY CONTINENTAL AIR COMMAND

a. Review and approve all Continental Air Command Air Force Domestic Emergency Plans.

b. Make frequent inspections to insure that the plans and preparations of each Continental Air Command Air Force are adequate and are in accordance with the provisions of this plan.

c. Relay full particulars to the Chief of Staff, United States Air Force, when intervention with Air Force troops and equipment is contemplated or has been undertaken (paragraph 13a(6), b(3) and c(2).)

15. MISCELLANEOUS REQUIREMENTS.

a. Personnel

2204

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

(1) The number and type of personnel assigned for domestic emergency activities and the duty to be performed by each will be included in each Continental Air Command Air Force Domestic Emergency Plan.

(2) In order to standardize the accounting of the personnel assigned for domestic emergency activities, the sample form (Annex VII) will be adopted by each Continental Air Command Air Force and will be included as an "annex" to each Domestic Emergency Plan. This annex will reflect the maximum number of troops to be employed with a minimum retained to maintain internal security and administrative functions. If necessary, this may mean the curtailment of the primary missions of the installations concerned.

(3) Each Continental Air Command Air Force Commander should require a survey to be conducted every six months, at each Air Force installation within his area of responsibility, and reports submitted on 1 January and 1 July of each year. This would allow each commander to amend his annexes to reflect the true status of assigned personnel at all times. In obtaining this information from the Air Force installations, reports control procedure may be applied in accordance with AF Regulation 11-5 by each Continental Air Command Air Force Commander.

(4) In case of death of military personnel, casualty procedure will be as described in AR 30-1820 as amended and AR 600-550 as amended.

2205

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

b. Logistics

(1) There will be included in each Continental Air Command Air Force Domestic Emergency Plan the type, location, number or amount assigned (less minimum retained for internal security and administrative functions), and other pertinent information regarding transportation and equipment which will be available in Domestic Emergency situations. In order to standardize the accounting of this transportation and equipment, the sample form as shown in Annex VIII will be adopted and included as an annex to each Continental Air Command Air Force Domestic Emergency Plan.

(2) This sample form is not all-inclusive and each Air Force Commander may make additions where he considers them necessary to the plan.

(3) This annex will be amended on 1 January and 1 July of each year, or more often if major changes occur within an Air Force Area, similar to the personnel annex, as required by paragraph 15a(3).

c. Maps and Charts

Maps and charts of installations, localities, landing fields, railroads, highways, waterways, etc. should be made an intergral part of all domestic emergency plans.

d. Public Relations

(1) In nearly all cases of domestic disturbances or disasters, the events in connection therewith are newsworthy items which are normally disseminated by press, radio and

2206

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

newsreel. The public is entitled to such news. The legitimate activities of news agencies toward that end are to be respected by military personnel.

(2) In conformity with this policy and in order to facilitate proper liaison and establish responsibility, the officer dispatching military personnel to the scene of the emergency will at the same time also dispatch qualified public information officers. It will be the responsibility of the latter, under direction of the commanding officer of military personnel so assigned, to lend appropriate and expeditious assistance in the legitimate activities of representatives of news agencies who are present. If public information officers are not available, it will be the responsibility of the dispatching officer to require observance of and adherence to the policy outlined in sub-paragraph (1) above.

(3) The classified nature of the Continental Air Command Domestic Emergency Plan and of subordinate domestic emergency plans will be maintained rigidly in all public or quasi public relationships.

(4) Public reference to "race riots", "strikes", or "domestic violence" will be avoided; instead, terms such as "emergency" or "disaster" will be used.

e. Supply - The issue, sale, receipt, purchase, and shipment of supplies will be governed by AR 500-60.

f. Funds - The use and reimbursement of alloted funds will be governed by AR 500-60.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

16. STATUS OF AIR FORCE RESERVE IN DOMESTIC EMERGENCIES

a. Personnel

The ordering to active duty of Air Force Reserve personnel for assistance in domestic emergency situations will not exceed fifteen days. Active duty orders will be issued under the authority of ConAC Letter 45-7.

b. Equipment

Subject to the provisions of this plan, the equipment of the Air Force Reserves can be utilized in domestic emergency activities; therefore, each Continental Air Command Air Force plan should include the possible use of such equipment.

17. HURRICANE EVACUATIONS

The plans for the evacuation of military aircraft within a hurricane danger zone do not fall within the concepts of Domestic Emergency Plans and activities. Such plans and operations are governed by AF Regulation 55-4. However, relief activities undertaken as a result of a hurricane disaster fall within the concepts of this plan.

18. COMMUNICATION WITH RESPONSIBLE AGENCIES

The Commanding General of each Continental Air Command Air Force and the commanders of each Air Force installation will be prepared to maintain communications on a twenty-four hour basis in the event of domestic emergency. Emergency communications facilities will be periodically checked. This will include such mobile communications facilities as may be available.

19. REPORTS

Reports required in conjunction with Domestic Emergency activities will be submitted in accordance with instructions contained in Annex IX.

Section 2. Provisions of the Statutes of the United States relating to intervention with Federal troops.

a. Section 5297, Revised Statutes. (U.S. Code, Title 50, sec. 201; Military Laws of the U. S. (1939), sec 502).

"Sec. 5297. In case of an insurrection in any State against the government thereof, it shall be lawful for the President, on application of the legislature of such State, or of the executive, when the legislature cannot be convened, to call forth such number of the militia of any other State or States, which may be applied for, as he deems sufficient to suppress such insurrection; or, on like application, to employ, for the same purposes, such part of the land or naval forces of the United States as he deems necessary."

b. Section 5298, Revised Statutes. (U. S. Code, Title 50, sec. 202; Military Laws of the U. S. (1939), sec. 503).

"Sec. 5298. Whenever, by reason of unlawful obstructions, combinations, or assemblages of persons, or rebellion against the authority of the Government of the United States, it shall become impracticable, in the judgment of the President, to enforce, by the ordinary course of judicial proceedings, the laws of the United States within any State or Territory it shall be lawful for the President to call forth the militia of any or all the States, and to employ such parts of the land and naval forces of the United States as he may deem necessary to enforce the faithful execution of the laws of the United States, or to suppress such rebellion, in whatever State or territory thereof the laws of the United States may be forcibly opposed, or the execution thereof forcibly obstructed."

DETROIT RACE RIOT

On the night of 20 June 1943, a fist-fight between a white man and a negro at Belle Isle amusement park in Detroit served as a spark to set off a disturbance which quickly spread to the negro section of war-crowded Detroit. Widespread rioting by gangs of white hoodlums and groups of negroes ensued, resulting finally in 31 dead, more than 600 injured, and tremendous property damage in looted stores, wrecked automobiles, etc. It was soon apparent that the situation had gotten beyond the control of State and local authorities and that a request for Federal aid was likely, probably from the Governor, since the legislature was not in session.

At 1100, 21 June 1943, the Provost Marshal General was informed by the Commanding General, Sixth Service Command, that two Military Police Battalions had been alerted but that he desired authority to call for additional ground force troops. The Provost Marshal General informed the Commanding General, Army Service Forces, and through Operations Division, WDGS, arranged for the alerting of the 2nd Division at Camp McCoy, Wisconsin. The Provost Marshal General, in coordination with the Judge Advocate General, prepared a proclamation for the President's signature to be signed in the event the Governor of Michigan requested Federal assistance in quelling the disorders, and a proclamation to be issued by the Commanding General, Sixth Service Command, only if the Presidential Proclamation was issued.

The Governor of Michigan having requested the aid of Federal troops, these proclamations were duly issued and Federal troops moved into the affected areas quelling the disorders efficiently and quickly. The troops actually employed were the 728th Military Police Battalion and later the 792nd Military Police Battalion from Fort Custer, Michigan, a provisional battalion made up of three (3) ZI Military Police Companies from Fort Custer and Selfridge Field, and later the 9th Infantry (of the 2nd Division) from Camp McCoy, Wisconsin. All disorders having subsided, all Federal troops were ordered out of Detroit on 8 July 1943, except two military police battalion (728th and 792nd) which remained in Detroit on an alert status.

WHISKEY REBELLION

In 1791, as part of his financial program, Alexander Hamilton secured the passage of an excise tax on the distilling of liquor. Shortly after its passage, the excise was protested in the Pittsburg area. The excise notice was torn down and the sign with the picture of the President's head thereon was filled with bullet holes. Discontent was also brewing in North and South Carolina.

President Washington took official notice of the opposition on 15 September 1792 when he issued a proclamation stating that all persons should refrain and desist from all unlawful combinations, the object of which was to obstruct the operation of law. He also stated that all lawful means would be used to bring to justice anyone who obstructed the operation of the law.

There was little opposition to the excise evidenced during the remainder of 1792 or during 1793. However, in the spring of 1794, a series of attacks on the revenue collectors occurred near Pittsburgh. In July 1794, these attacks culminated in a violent attack on the home of one of the inspectors. A small garrison of troops from Pittsburgh was sent to aid him but the troops were forced to surrender to a larger armed body. The mail from Pittsburgh was robbed by the insurgents and meetings continued to be held. An attack on the Fort at Pittsburgh was feared.

The President, counseled by Hamilton, determined to send an imposing force to enforce the law, and, if possible, deter the opposition from fighting by reason of the size of the force opposing them. The President ordered the Governors of New Jersey, Pennsylvania, Maryland and Virginia to raise over 12,000 troops to be used against the insurgents.

The Army was assembled at Carlisle, Pennsylvania, and President Washington went to the assembly area and counseled both officers and men as to the duties they were to perform. He emphasized the need for proper conduct on the part of the troops. General Lee of Virginia was placed in command and, at Washington's suggestion, published another proclamation inviting "all good citizens, friends of the Consitution and laws, to join the standard of the United States."

The troops proceeded to the area where the disturbance had occurred and rounded up all suspects in a raid conducted in one day. This ended the oppcsition by the citizens of western Pennsylvania. Within a short time, all of the troops except a garrison of about 2,500 men were removed from the area.

RESTRICTED

LAKE CHARLES, LOUISIANA, REFINERY STRIKE

On 10 April 1945, the Eighth Service Command reported a strike at the Lake Charles Refinery, operated by Cities Service. This refinery was a Government-owned facility, title to which was held by the Defense Plant Corporation, leased to Cities Service for operation.

On 11 April 1945, it was reported that picketing was taking place and minor incidents had occurred, but there had been no physical damage to the plant.

On his own initiative, the service commander directed that one company of the 76th Military Police Battalion be dispatched from Camp Claiborne, Louisiana, to the Lake Charles area. The troops arrived at 2000 on 11 April 1945. A guard was posted at the main gate and a patrol maintained inside the perimeter of the plant area immediately upon arrival at the area, purely to protect the government-owned property.

On 12 April 1945, a civilian guard was fired upon and all the troops were then moved to the plant from the Air Base where they had been quartered.

On 18 April 1945, the President's order directing seizure and operation of the refinery was issued and posted at the plant. Pickets dispersed shortly thereafter, and within a few days, the workers returned to their jobs.

No action by the troops was necessary at any time except to maintain a guard at the plant in order to protect the property before the seizure, as well as after.

FOREST FIRE FIGHTING

In the Fall of 1944, it was discovered that the Japanese were launching paper balloons into the stratosphere where they would be carried by prevailing winds tc the United States. The balloons were equipped with automatic ballast dropping devices to keep them in flight until they reached this country where incendiary and occasionally high explosives were to be dropped automatically, after which a further device would destroy the balloon. After numerous sightings and some recoveries of the balloons, which appeared in increasing numbers in the early months of 1945, it was established that the "pay load" of a majority of the balloons were incendiary bombs. The War Department consulted the Forest Service of the U. S. Department of Agriculture and was advised that these bombs from the balloons constituted a grave threat of serious forest fires in the vast wooded areas in the Western United States, where because of a manpower shortage, an unusually low precipitation in 1945, and a large accumulation of slash on the ground in the forests (due to the emphasis on lumber production in the war effort) the natural hazards were already unusually great. The Forest Service, which with the State and local forest agencies was primarily responsible for the prevention and control of forest fires, requested the War Department to assist it in the formulation of a plan, and in manpower, supply, and equipment, so that during the summer months of 1945 (the forest fire season) a trained force could be ready to combat the expected forest fires. The internal security responsibility as regards forest fires started from the balloons was a responsibility of the Provost Marshal General and the War Department authorized him to coordinate forest fire protection matters. Working closely with the Forest Service, the Commanding General, Ninth Service Command, and all other interested War Department agencies, the following was accomplished:

(1) Secured the assignment of the 555th Parachute Infantry Battalion to Pendleton Army Air Field, Oregon, where it received specialized training (under the technical supervision of the Forest Service) in advanced methods of combatting forest fires as "smoke jumpers". When the battalion completed its training it became an initial striking force for use in fighting forest fires. Incidental, but necessary to this assignment was considerable planning and work in regard to special equipment necessary for this battalion, for "spotting" planes, and for transport aircraft.

(2) Secured the activation of ten Provisional Engineer Fire Fighting companies (269 enlisted men and four officers, each) to be specially earmarked for duty in fighting forest fires. Considerable time was devoted to the problem of equipment necessary for these companies and the equipment, which was finally authorized, was considered adequate for their mission. However, as activation and training of these companies was accomplished, other needs became apparent and at the request of the Commanding General, Ninth Service Command, the Emergency Protection Branch initiated steps to secure the enlargement of this authorization.

(3) Formulated an overall forest fire fighting plan for the War Department.

NORTH AMERICAN AVIATION STRIKE - 1941

A jurisdictional labor dispute occurred at the North American Aviation Plant at Los Angeles, on 5 June 1941. Despite an agreement with the company, to the effect that no stoppage of work would take place pending the settlement of the dispute, the local without authorization from the national union or the CIO, called the strike. The shutdown affected 9,000 production workers and over 2,200 office and other employees.

National labor leaders denounced the action of the local union and called upon them to return to their jobs but they refused to do so. The strike occurred less than ten (10) days after President Roosevelt had proclaimed an unlimited national emergency in which he had called upon all citizens engaged in defense work to give precedence to the needs of the nation.

Federal intervention was rumored immediately, but, despite the rumor, the local union refused to go back to work. Troops from Camp Hunter Liggett and Fort MacArthur were alerted and sent to the Los Angeles area. No action was taken by them, however, at this time.

On the following Monday morning, at which time it was rumored that the plant would resume operations, pickets and workers crowded about the plant, fighting broke out and police attempted to open the picket lines. Tear gas was used but the lines were not broken.

Meanwhile, having been apprised of the situation, the President ordered the troops to take over. They moved in immediately, just in time to prevent a second outburst of disorder. Within a few minutes roads were cleared and the plant gates were opened. The military commander guaranteed safe conduct for workers to and from their homes, and set up patrols in the outlying areas to insure protection for those who returned to work. Within 36 hours nearly 90 percent of the workers had returned.

To enforce the takeover, picketing was forbidden within a mile of the plant, the sale of liquor was banned within the same area and only residents and workers bound for the plant were allowed into the strike zone; patrols were set up inside and outside the plant and the main gate was guarded.

In less than a month, the President terminated the Government possession and all troops were removed from the area. Prior to this time, however, over half of the troops originally detailed to the area were relieved when it became apparent that further disorder was unlikely.

PHILADELPHIA MUNICIPAL TRANSIT STRIKE

On 1 August 1944, a general strike of the operators of the Philadelphia Transportation Company occurred, as car and bus operators refused to work in protest against the company's employment and training of eight negro street car operators, which action the company was taking in compliance with a series of directives from the Fair Employment Practices Committee and the War Manpower Commission. Appeals to the strikers to return to work having failed, acts of violence being feared, and continued operation of this transportation system being vital to the war effort, the President, by Executive Order, directed the Secretary of War to take possession of and operate the Philadelphia Transportation Company. Major General Hayes, Commanding General, Third Service Command, was designated as the War Department Representative. The seizure was effected immediately without the necessity for the use of any force.

The conditions existing at the time of the seizure indicated the necessity for troops to guard the properties and facilities of the company and the probable need for military transportation and troops possessed of the requisite skill to act as operating personnel. Accordingly, troops consisting of the necessary operating units, overhead units, and field forces, as well as military vehicles adaptable for action in the company's transportation system, were secured. Officer observers were assigned to the seventeen car barns and garages and a system of hourly reports from these observers to the commander of troops was established.

General Hayes issued an order on 4 August to all employees that they would have to report for duty at their first regular assigned runs on 7 August, or suffer immediate dismissal. They were informed that selective service would be requested to cancel deferments for those not reporting and the War Manpower Commission would be requested to refuse certificates of availability to strikers, thus making it impossible to obtain employment elsewhere. Full publicity from newspapers and radio stations was given these orders. On 5 August, the Department of Justice obtained warrants for the arrest of four (4) principal strike leaders for alleged violation of the War Labor Disputes Act. These men were arrested and later released on bond. By 7 August, normal operations had been resumed although armed guards were assigned to every car, bus, and subway train to prevent acts of violence, a total of 2665 being so assigned with 375 held in reserve.

On 9 August, the company and the union involved reached an agreement covering wages, hours, and terms and conditions of employment, and normal operations continued until 17 August 1944, at which time possession, control, and operation by the War Department of the transportation system were terminated.

During this operation, reports from the War Department Representative to the War Department were processed through the Provost Marshal General's Office.

CHICAGO TEAMSTERS STRIKE

At 0001 on 16 June 1945, pursuant to Executive Order of the President, The Director of the Office of Defense Transportation took possession of and began operating the strike bound trucking industry in Chicago. On refusal of the strikers to return to work, ODT, in accordance with provisions of the Executive Order which authorized it, requested military assistance, responsibility for which was delegated to the Commanding General, Sixth Service Command. Numerous personnel was necessary in order to drive the trucks and to provide adequate protection for drivers, trucks and cargo. After utilizing three of his four Military Police Battalions, the Commanding General, Sixth Service Command, procured two additional battalions from the Fifth Service Command, and requested the Provost Marshal General's assistance in obtaining two more. The Emergency Protection Branch telephoned the Commanding Generals of the First and Second Service commands and arranged for the movement to Chicago of one battalion (the 804th) from Fort Devons, Massachusetts (First Service Command), and one (the 722nd) from Fort DuPont, Delaware (Second Service Command). In addition to the personnel of the Military Police Battalions, the Commanding General, Sixth Service Command, was furnished by the War Department with drivers and guards from Army Ground Forces and Army Air Forces from all parts of the country. The total troops strength as operations progressed approximated 16,000. The Provost Marshal General sent the Chief, Emergency Protection Branch, to Chicago to observe Army operations, and, at the request of the service commander, sent two safety officers to assist the Sixth Service Command in organizing an adequate motor vehicle safety program. At the direction of the Commanding General, ASF, the Commanding General, Sixth Service Command, provided the Provost Marshal General with a daily report of operations, which was processed in Emergency Protection Branch, and distributed to the Commanding General, ASF, and to all interested War Department agencies. This report was terminated with the report of 27 June when it became apparent that the truck drivers' strike was over and that the military personnel could be released for return to their permanent stations.

RESTRICTED

EXECUTIVE ORDER

Authorizing the Secretary of War and the Secretary of the Navy to Establish and Maintain Military Guard and Patrols, and to Take Other Appropriate Measures to Protect Certain National-Defense Material, Premises, and Utilities from Injury or Destruction

WHEREAS the United States is now at war; and

WHEREAS there exists a serious and immediate potential danger of sabotage to national-defense material, national-defense premises, and national-defense utilities which may menace our maximum productive effort; and

WHEREAS it is considered necessary in the interests of national defense that, in particular situations where hazardous, dangerous, or other unfavorable conditions may from time to time exist, special precautionary measures be taken by establishing and maintaining military guards and patrols or other appropriate means to protect from injury or destruction national-defense material, national-defense premises, and national-defense utilities;

NOW, THEREFORE, by virtue of the authority vested in me as President of the United States, and Commander-in-Chief of the Army and Navy of the United States, I hereby authorize and direct the Secretary of War, whenever he deems such action to be necessary or desirable, and the Secretary of the Navy, whenever he deems such action to be necessary or desirable, to establish and maintain military guards and patrols, and to take other appropriate measures, to protect from injury or destruction national-defense material, national-defense premises, and national-defense utilities, as defined in the act of April 20, 1918, 40 Stat. 833, as amended by the act of November 30, 1940, 54 Stat. 1220, and the act of August 21, 1941, 55 Stat. 655.

This order shall not be construed as limiting or modifying the duty and responsibility of the Federal Bureau of Investigation, Department of Justice, with respect to the investigation of alleged acts of sabotage.

FRANKLIN D. ROOSEVELT

THE WHITE HOUSE
December 12, 1941
(No. 8972)

PRESIDENT'S WAR POWER

This power was first exercised by President Roosevelt in 1941 in the North American Aviation strike (Tab "E"). The basis of the President's power was stated by Attorney General Robert Jackson to be an exercise of the "aggregate of the President's power derived from the Constitution itself and from the statutes enacted by Congress." The Attorney General pointed out that Congress had appropriated money "to equip and enlarge the Army and to provide for a strengthened Navy", and that, as a consequence, it was the duty of the President to find the means to carry out the Congressional intent. Using this argument as a basis for federal intervention, the President in June, 1941, ordered federal troops to take over the North American Aviation Corporation. The arguments set forth by the Attorney General have never been tested in a court action. However, although some persons have questioned the argument, it is believed that during wartime it can legally be sustained.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

WAR POWERS ACT

In addition to the President's constitutional power to wage war, in some seizures, the First War Powers Act and Selective Service Act have been cited as authority for intervention by the President in seizing private facilities and operating them. These two statutes were admitted by some authorities to be of questionable strength in supporting these seizures. However, they were not cited as exclusive authority, but were included in addition to a statement of the President's general constitutional power, and his powers as Commander-in-Chief.

The defects have since been cured by the War Labor Disputes Act, which was enacted by Congress in 1943. This Act amended the Selective Service Act and empowers the President to take possession of, use, and operate by the United States whenever he finds "after investigation, and proclaims that there is an interruption of (a) plant, mine, or facility, as a result of a strike or other labor disturbance, that the war effort will be unduly impeded or delayed and that the exercise of such power and authority is necessary to insure the operation of such plant, mine, or facility in the interest of the war effort."

Such a seizure is normally accomplished by the issuance of a Presidential Executive Order. A late example of such action occurred in the recent meat packing strike where under Executive Order 9605, 24 January 1946, President Truman ordered the Secretary of Agriculture to take possession of and operate certain plants and facilities engaged in the production, processing, transportation, sale and distribution of livestock, meat, meat products and by-products. Under the Executive Order the Secretary of Agriculture was empowered to request the Secretary of War to furnish protection for such plants and to protect all persons employed or seeking employment therein, their families and their homes and to furnish equipment, manpower, and other facilities or services deemed necessary by the Secretary of Agriculture to carry out and accomplish the purposes of the Order. The Secretary of War was directed to furnish necessary manpower to effect the purposes stated above.

The War Labor Disputes Act prohibits taking possession of a plant, mine, or facility after the President proclaims the termination of the war.

ANNEX VI

Domestic Emergency Control Officer

1. Each ConAC air force commander will designate an "Air Force Domestic Emergency Control Officer." This officer will be thoroughly familiar with the plans and operating principles of the Continental Air Command Domestic Emergency Plan, the appropriate Army area plans, the Naval District plans and the local air force plan.

2. The Domestic Emergency Control Officer will be prepared to:

   (1) Advise and assist the ConAC air force commander in implementing the plan and fulfilling the responsibilities outlined therein.

   (2) In the event of a domestic emergency, coordinate the action of the air force with those of appropriate Army and Navy commands, as directed by the air force commander.

   (3) Advise and assist other staff officers in carrying out action required by their respective division.

   (4) Periodically review Domestic Emergency Plans for his area and the Base Plans of air force installations within his area and recommend appropriate changes to the air force commander.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

ANNEX VII

PERSONNEL INSTRUCTIONS

1. When practicable, the personnel assigned for Domestic Emergency activities at each installation will be organized into teams such as Communications Teams, Medical Teams, Administrative Teams, Police Squadrons, etc. The accounting of personnel assigned for Domestic Emergency activities will be by the number of teams at each installation and on a form similar to that which is attached hereto as Tab A. The composition of each type team (Type Personnel, MOS, Number of Officers and Number of Airmen) will be indicated as a part of the personnel annex (see Tabs B through L).

2. It can be noted in Tab A that a number of specialized personnel cannot be organized into teams or considered part thereof. Such personnel should be reported by number in the miscellaneous specialist columns.

3. Personnel that cannot be classified either as a member of a specialized team or as a miscellaneous specialist should be detailed as a member of a Police Squadron (Tab E). These squadrons will be used for dispersing rioters, guard duties, quelling uprisings and other miscellaneous duties that are ordinarily connected with major disasters. Police Squadrons will be the type unit used most frequently in Domestic Emergency activities.

COMPOSITION OF AN ADMINISTRATIVE TEAM

JOB DESCRIPTION	MOS	TYPE "A" OFFICERS	TYPE "A" AIRMEN
Team Commander (See Para 2 below)		1	
Assistant Team Commander	2120	1	
*Chaplain	5310	1	
Public Information Officer	5401	1	
Administrative Specialist	502		1
Clerk-Typist	405		4
**Chauffeur	345		2
Information Specialist	274		1
Photographer	152		1
TOTAL		4	9

* Will accompany team only on team commander's request
** To act as runner or messenger in addition to duty as chauffeur

1. Purpose - The administrative team is responsible for supervising and coordinating the activities of other USAF emergency teams placed under its control by proper authority; for acting as a liaison agent for these teams in the event coordination with other military, naval or civilian agencies is indicated, and for providing Public Information coverage.

2. Responsibilities and Duties of the Team Commander - Normally, the team commander will be in charge of all air force participation and therefore, should not be below the grade of Lt. Colonel. In this case, no MOS is specified; however, if an administrative team is committed to an operation where there is need for administrative assistance, only, then the team commander should have an MOS of 2120 and would not need to be above the grade of Major. Normally the Team Commander will:

a. Direct the operations of the Administrative Team and determine its policy and procedure for efficient functioning.

b. Supervise and coordinate the activities of other USAF emergency teams within the emergency area.

c. Place the resources of his emergency teams at the disposal of the senior army or navy officer present in the event USAF emergency teams are furnishing aid under Operation B to the Army or Navy.

d. Maintain liaison with interested military and civilian agencies within the emergency area.

e. Require all emergency teams under his supervision to maintain a record of action taken, supplies dispensed, etc., and will maintain a consolidated

COMPOSITION OF EMERGENCY POLICE SQUADRONS

JOB DESCRIPTION	MOS	TYPE "A"		TYPE "B"	
		OFFICERS	AIRMEN	OFFICERS	AIRMEN
Squadron Commander	9100 or 9110	1			
Flight Commander	9100 or 9110	2		1	
First Sergeant	502		1		
*Flight Sergeant	677		2		1
*Squad Leader	677		6		3
*Squadron Personnel	677		72		36
TOTAL		3	81	1	40

*Personnel need not possess above MOS; however, it is desirable that they be familiar with MP duties.

1. Purpose - The police squadron is responsible for suppressing crime and violence and re-establishing and maintaining law and order in the emergency zone within the limits of its capabilities. This specifically includes riot control, prevention of looting, the establishment and maintenance of traffic control, and guarding critical areas in the emergency zone, together with other duties normally associated with military police functions.

2. Responsibilities and Duties of the Squadron Commander:

a. Will direct the operations of his unit and determine its policies and procedures for efficient functioning. He will be responsible to the Air Force Officer-in-Charge of Air Force participation for the efficient operation of his police squadron.

b. Will require each individual assigned to the squadron to become familiar with the duties connected therewith.

c. Will secure detailed maps of the emergency area and plan the deployment and utilization of his forces prior to arriving at the scene of the emergency.

3. Capabilities - These police squadrons are capable of effectively accomplishing their mission in areas of the approximate population indicated below:

a. Type "A" squadron can perform the above duties in an area of approximately 20,000 population.

b. Type "B" squadron can perform the above duties in a community of approximately 10,000 population.

REPORTS

1. There are three basic type reports which are required by this headquarters to be submitted by each ConAC Air Force Commander in conjunction with Domestic Emergency activities. The requirements of these reports are outlined below:

a. Domestic Emergency Preliminary Report: As soon as it becomes apparent that a domestic emergency condition will exist within an air force area, the ConAC Air Force Commander having jurisdiction over the area to be effected, will report, by priority, the full particulars to this headquarters by the most expeditious means available. The message form attached hereto (Tab A) will be used and each section thereof will be answered in sequence listed. Reports Control Symbol CNC-DO-U1A (Part 1) is assigned this report.

b. Domestic Emergency Action and Situation Report: To be submitted to this headquarters (with an information copy of the report forwarded to Headquarters USAF) upon placing the Domestic Emergency Plan in operation and each twenty-four hours thereafter at 1200 hours. This priority report (see Tab B attached hereto for form to be used) will include the action taken, action contemplated for the next twenty-four hours, and a general description of the situation. The report to be forwarded by most expeditious means available. Reports Control Symbol CNC-DO-U1A (Part 2) is assigned this report.

c. Final Report (Letter Form): Written in narrative form to cover entire period of preparation for the emergency, the emergency period and action after the emergency. The report will include: Date emergency ended, synopsis of emergency including action taken, casualties and fatalities

2249

RESTRICTED

*ConACR 55-8
1-5

ConAC REGULATION)
55-8)

HEADQUARTERS CONTINENTAL AIR COMMAND
Mitchel Air Force Base, N.Y., 29 March 1950

OPERATIONS

Aircraft Recognition in Air Defense

	Paragraph
Purpose	1
Scope	2
General	3
Recognition Zones	4
Recognition During Peace Alert	5
Recognition During Emergency and War Alert	6
Procedure	7

1. Purpose. The purpose of this Regulation is to establish the general policy for the recognition of aircraft by the air defense system.

2. Scope. This Regulation contains policy guidance for the two conditions of air defense system operation:

a. Peace Alert - operations conducted during peace time.

b. Emergency or War Alert - operations conducted during period of military national emergency declared by higher authority or operations conducted during time of war.

3. General. The prompt and accurate recognition of all aircraft in flight in specified, critical recognition zones surrounding and within areas being defended is essential to the accomplishment of the air defense mission.

a. Electronic recognition systems (IFF) do not always provide positive, completely reliable recognition; therefore, a system of control of air traffic and recognition of friendly aircraft by flight plan matching must be used in addition to IFF.

b. Air transportation of personnel and materiel during both peace and war is of great importance to the industrial, military and governmental effectiveness of this nation. Restrictions placed on flying necessary to achieve recognition of aircraft will be held to a minimum consistent with the requirement for air defense.

c. The Civil Aeronautics Administration is the agency having primary responsibility for the control of air traffic and the supply of flight plan data to the air defense system.

4. Recognition Zones. a. A recognition zone is the air space above a specified geographic area which is established for ready recognition of aircraft operating in or near an active air defense system. Normally, this will correspond to the defense area.

b. Headquarters United States Air Force and the Civil Aeronautics Administration will determine the size and location of recognition zones for all aircraft, based on requirements submitted by Headquarters Continental Air Command.

c. Headquarters Eastern Air Defense Force and Western Air Defense Force will submit their requirements for such recognition zones to this headquarters for coordination with higher headquarters.

5. Recognition During Peace Alert. a. During peace alert operations, the objective of the aircraft recognition system is to provide for recognition of aircraft in a minimum number of recognition zones.

b. The location, size, and number of these zones will be fixed by the following:

(1) The requirements for recognition during such alert periods.

*This Regulation supersedes ConAC Regulation 101-2, 30 August 1949.

L-50-299

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

(2) The capabilities of the radar system.

(3) The traffic loads.

(4) The capability of the Civil Aeronautics Administration to undertake the additional workload.

c. The filing of prescribed flight plans during peace alert periods is on a request and cooperative basis for civil aircraft, since legal authority does not exist during peace to control civil flights during VFR weather.

d. Military aircraft will be required by regulations to file the necessary flight plans during peace alert. These regulations are to be issued in the near future.

e. The recognition of military aircraft engaged in tactical training during peace alert operations will not be based on Civil Aeronautics Administration flight plan data. Major USAF commands will make the necessary arrangements with the Air Defense Force commanders concerned to provide for the recognition of this type of air traffic before each flight.

6. Recognition During Emergency and War Alert. a. During emergency and war alerts, all aircraft not engaged in actual combat operations will be required to file IFR type flight plans when flying in recognition zones (legal authority for this action is being secured).

b. Close control of aircraft during emergency and war alert will be designed to meet the following requirements:

(1) Positive recognition in air defense areas.

(2) Safety of civil and noncombat military aircraft.

(3) Permit the Civil Aeronautics Administration to clear the air spaces in which actual or suspected air defense combat operations occur. This procedure will be vital to the effectiveness of combat operations as it will reduce the recognition, target assignment, and weapon mutual interference problems.

c. The recognition of military aircraft engaged in combat operations during emergency and war alert will be implemented by necessary arrangements made by major air commands conducting such operations with Air Defense Forces.

7. Procedure. a. The detailed operating procedures necessary for the recognition of aircraft are affected by the geography, air traffic density, radar deployment, Civil Aeronautics Administration organization and defense mission of each specific air defense area. Air Defense Force commanders, in coordination with Civil Aeronautics Administration regional headquarters, are responsible for the development of operating procedures for recognition in each area within the framework of the basic policies stated herein.

b. Air traffic will be uncontrolled except as it enters, operates in or passes through recognition zones. The size and number of zones during the peace alert period will be consistent with the air defense capability and during emergency and war periods will be as required for defense.

c. All flight plan data originating with the Civil Aeronautics Administration or Military Flight Service will be passed by the Civil Aeronautics Administration and Military Flight Service to the appropriate radar stations and/or air defense control centers. Air Defense Force commanders will determine the proper communication system and procedures for use of this data.

NOTE: The Civil Aeronautics Administration and/or Military Flight Service will provide necessary personnel (security controllers) at their traffic control centers.

d. Recognition of radar tracks normally will be made by specified radar stations. This recognition must be made in a minimum time (one minute) based on the coincidence of the observed track with flight plan data. The limits of deviation of the observed track from

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

flight plan data allowed for recognition will be held to the lowest practical minimum. These limits should conform to Civil Aeronautics Administration requirements.

e. GCI radar stations receiving or plotting unrecognized radar tracks will intercept immediately or take other specific action as directed by the Air Division commander. The unrecognized track and the action taken will be reported to the air defense control center without delay.

f. Only hostile or friendly tracks will appear on air defense control center plotting boards during emergency or war operations after the actions outlined in paragraphs 7d and e, above, are taken. Erroneous hostile recognition may be corrected by air defense control centers as the interception proceeds, based on additional information received from either Civil Aeronautics Administration or the tracking radar station.

g. "Unknown" or "unidentified" tracks passed to air defense control centers during peace alert operation will be carried as "unknown" or will be intercepted for visual identification when and as authorized by this headquarters.

Notes to Instructors

1. Curricula contained in this outline has been prepared in accordance with the provisions of paragraph 7b, AF Regulation 45-23. Sufficient material is included to provide Photographic Volunteer Air Reserve Training Flights with four (4) hours' training per month for a period of three (3) years. It is realized that considerably more than one hundred forty-four (144) hours would be required to thoroughly cover the material offered, therefore, the hour figure listed at each subject is only a suggested time derived from an attempt to balance the outline and gives weight to each subject in accordance with its scope and/or significance.

2. The outline is arranged in a normal development sequence with basic material listed early in the program and more complex material in later periods. There is no objection, however, to any rearrangement or substitution of material to fit the needs of any particular photographic flight provided, of course, that the training schedules based on this outline, which are prepared quarterly by the flight, are approved by the appropriate air force, as required by paragraph 7c, AF Regulation 45-23. Reference to appropriate technical information are included, however, in many instances source material listed may be augmented. For example, the AF Extension Course Catalog offers courses obtainable from the Unit Guidance Branch, Benjamin Harrison AF Base, Indiana, which are valuable aids to both units and interested qualified individuals. The following courses are listed therein which pertain to current photographic techniques and allow for the accumulation of points creditable under the VARTU program.

Course No.	Title
30-18	Aerial Photography
309	Reconnaissance
105	Maps, Charts & Aerial Photographs
30-16	Intelligence Reconnaissance
345	Introduction to Air Intelligence
30-17	The Role of Photo Intelligence

3. A number of methods may be applied by the instructor for the purpose of achieving effective learning. A brief summary of these includes the lecture method, the discussion or seminar method, and the panel method. Everyone is familiar with the lecture method. It should be used sparingly since it achieves the poorest results. The discussion or seminar method encompasses the active participation of the entire group under the leadership of one or more members. It is an excellent method of instruction when all members of the group are well prepared. The panel method, whereby under proper guidance two or more members present the material to be covered, also offers a most productive method for learning. To apply the panel method to the outline inclosed, the instructor would assign individual hours to two or more members of the flight. The net result of this type of assignment would be an equitable distribution of the subjects to be covered among all the members of the flight without imposing an undue burden on any one or more individuals. Each panel would take for its guide the brief outline for the hour assigned and expand it for presentation in accordance with its experience and the reference materials available. This method has the

2308

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

additional advantages of promoting an improving type of competitive spirit and a feeling of unity among the members as they work on the individual panels for their presentations.

4. Regardless of the method used, sufficient time must be allowed for the preparation of each period of instruction. In this connection, the instructor, or the seminar or panel leader, must have a lesson plan for each specific period of instruction. A good lesson plan would be one having the following main steps:

a. Objective of instruction.

b. Teaching devices to be used.

c. The procedure or points to be covered, in their proper sequence.

d. A check-up and review to emphasize important points covered and to stimulate thinking.

e. Questions: these questions should be prepared in advance for the purpose of offering them to the group should the group not have any questions to ask during this portion of the period.

f. Comments and remarks which by their constructive nature could be utilized for future periods to improve the technique used.

5. In general, effective planning is the basis of good teaching, therefore, it is suggested that for each specific subject definite objectives be established and all material be carefully planned.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

PHOTOGRAPHIC FLIGHT MEMBERSHIP

1. The following personnel are normally included as the basic members of the V.A.R.T.U. (Photographic Flight):

a. Officers

(1) Photomapping Officer, 7916
(2) Aerial Photographic Officer, 8502
(3) Still Photography Officer, 8540

b. Airmen

(1) Photographer, 152
(2) Aerial Photographer-Gunner, 939
(3) Aerial Photographer, 940
(4) Camera Technician, 941
(5) Photographic Laboratory Technician, 945
(6) Master Photographic Technician, 1945

2. The following general listing of personnel and any others whose military specialty is closely allied to photography and whose membership in a Photographic Flight would benefit the individual and also the flight by their utilization in broadening the scope of instruction for individual parts of the curriculum:

a. Officers

(1) Tac Recon Pilot, Single Engine, 1061
(2) Photo Recon Pilot, Two Engine, 1062
(3) Public Relations Officer or Public Information Officer (new title), 5401
(4) Photographic Equipment Officer, 7052
(5) Map Reproduction Officer, 7917
(6) Photo-interpreter, 8503
(7) Motion Picture Technical Officer, 8537
(8) Medical Photographer, 8547
(9) Military Intelligence Officer, 9300
(10) Intelligence Staff Officer (combat), 9301
(11) Intelligence Staff Officer (base), 9307

b. Airmen

(1) Photogrammetrist, 004
(2) Cameraman, Motion Picture, 043
(3) Draftsman, Topographic, 076
(4) Photolithographer (designated type), 107

(a) Lithographer, Photo Transfer
(b) Photographer, Copy Transfer
(c) Photographer, Copy Cameraman

(5) Film Editor, Motion Picture, 131
(6) Projectionist, Motion Picture, 137
(7) Intelligence Specialist, 631

BIBLIOGRAPHY OF VISUAL TRAINING AIDS FOR VOL. AIR RES. TNG. UNITS

PHOTOGRAPHIC FLIGHTS

The visual training aids listed below have been selected for their applicability to this training outline. All of the training aids listed are rental free; however, it will be necessary to pay the "Railway Express Collect" fees and to return each training aid by insured mail. Where funds are available for the small costs involved it is suggested that this material be used.

INTRODUCTION TO PICTURE MAKING.

TYPE: Illustrated Lecture with 35mm slides. TIME: 15 minutes.
SOURCE: Eastman Kodak Co., Camera Club and School Service, Rochester 4, N.Y.
CHARGE: Free (Return Postage).
CONTENT: Introduction to the over-all story of general steps in making a photograph. Beginning with the placement of the subject in relation to light, a short summary covers the picture taking possibilities and briefly describes darkroom procedures.

NIGHT PHOTOGRAPHY.

TYPE: Illustrated Lecture with 47 Slides. TIME: 35 minutes.
SOURCE: Eastman Kodak Co., Camera Club & School Service, Rochester, N.Y.
CHARGE: Free (Return Postage).
CONTENT: Discussion of outdoor photography at night and indoor photography with Photo Flash and Photo Flood lighting. Examples with exposure times are given on photographs of Street Scenes, Fireworks, lighting at night as well as picture possibilities indoors with various lighting set-ups. Elementary synchronized flash photography is briefly described.

MAKING PICTURES PEOPLE LIKE.

TYPE: Illustrated Lecture with 56 Slides. TIME: 15 minutes.
SOURCE: Eastman Kodak Co., Camera Club & School Service, Rochester 4, N.Y.
CHARGE: Free (Return Postage).
CONTENT: Discussion of characteristics of various classes of Photography such as children, outdoor scenes, sports, story telling, people, tabletops, and still life in terms of what it takes to make them interesting. It shows how to make a snapshot or record picture into a photograph with appeal. In addition, a complete illustration list with exposure, filter information and other picture-taking data is given.

THIS PAGE IS DECLASSIFIED IAW EO 13526

TNG AIDS - PHOTO FLTS (Cont'd)

THE MASTER SERIES.

TYPE: Illustrated Lecture with 10 Photographic Enlargements. TIME: 30 minutes.
SOURCE: Eastman Co., Camera Club & School Service, Rochester 4, N.Y.
CHARGE: Free (Return Postage)
COMMENT: Leading pictorialists are represented in this lecture and each one tells his or her story of how the photographs were made. These pictorialists discuss their prints in their own words, give photographic data as well as their ideas of composition and print finishing.

PHOTOGRAPHY (EF 266).

TYPE: 16mm Motion Picture. TIME: 10 minutes.
SOURCE: Department of the Army, (Signal Corps).
CHARGE: Free
COMMENT: The film covers the many and varied phases of photography, its use in industry, science, publications, and advertising. The work of a portrait and commercial photographer is outlined as well as lighting, developing, retouching and printing. News photography and motion picture photography are introduced and discussed.

FLASH PHOTOGRAPHY

TYPE: 16mm Motion Picture. TIME: 25 minutes.
SOURCE: Assistant Chief of Staff, Intelligence, Motion Picture Service Div.
CHARGE: Free.
COMMENT: This film discusses the different types of Flash lamps used for between the lens and focal plane shutters. The operation of synchronization is discussed as well as the importance of reflectors for effective lighting. In addition the film covers special flash lamps for speed, color, daylight, and infra-red photography. Maintenance of equipment and tests for proper synchronization are discussed at the end of the film.

SYNCHRO-SUNLIGHT PHOTOGRAPHY (4th Photo Strip No. 1).
TYPE: 35mm Film Strip.
SOURCE: 4th Photo Lab Training Section, Langley Air Force Base, Virginia.
CHARGE: Free

COMMENT: The film shows the principle of Synchro-Sunlight work and gives samples of the types of photographs where it should be applied. It gives the relation between Flash Guide numbers, Film Speed, and exposure data to be used with or without an electric exposure meter.

THIS PAGE IS DECLASSIFIED IAW EO 13526

TNG AIDS - PHOTO FITS (Cont'd)

PHOTOGRAPHY IN CRIMINAL INVESTIGATION.

TYPE: Illustrated lecture with 34 slides. TIME: 30 minutes.
SOURCE: Eastman Kodak Co.
CHARGE: Free (Return Postage).
CONTENT: Application and use of photography in criminal investigation are described. Many actual experiences are included in the text and technical details of making photography in criminal investigation are given.

THE SPEED GRAPHIC (SH-3671).

TYPE: 35mm Film Strip
SOURCE: U.S. Navy, Director of Training, Training Aids Section, Norfolk, Va.
CHARGE: Free.
COMMENT: Shows the basic components of the Speed Graphic C-3, C-4, and illustrates the preparatory procedure prior to taking pictures. Tells how to focus, set the shutter, load camera, line up shot, and make exposure etc...

PROPERTIES OF PHOTOGRAPHIC LENSES (FS 1-47)

TYPE: 35mm Slide Film.
SOURCE: Requisition on Form 104B to training aids division (AF).
CHARGE: Free.
CONTENT: The film covers basic optics in relation to function of lenses, introduction to pinhole camera, focal length of lenses and size of image. It stresses the necessity of focussing a lens and the inversion of the image.

LIGHT WAVES AND THEIR USES:(MC-1574)
TYPE: 16mm Motion Picture. TIME: 11 minutes.
SOURCE: U.S. Navy, Director of training, Training Aids Section, Norfolk, Va.
CHARGE: Free.
CONTENT: The film demonstrates some principles of reflection, refraction, shows how lenses are used to control light, touches briefly on polarization and the wave lengths of light in the spectrum.

TERMS USED IN PHOTOGRAPHIC OPTICS: (FS 1-239)

TYPE: 35mm Slide Film.
SOURCE: Requisition on Form 104B to Training Aids Division (AF).
CHARGE: Free.
CONTENT: The film explains the meaning of common optical terms used in photography. In addition, focal plane shutters, focal length, angle of field, angle of view are discussed as well as depth of field, lens speed and characteristics of lenses such as wide angle and telephoto lens.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

RECONNAISSANCE MAPPING WITH TRI-METROGON PHOTOGRAPHY

TYPE: 16mm Motion Picture. TIME: 2 1/2 hours.
SOURCE: Director, Geological Survey, Department of the Interior, Washington, D.C.
CHARGE: Free (Return Postage).
CONTENT: This film is made by the Pan American Institute of Cartography and History with the cooperation of the U. S. Geological Survey and the U.S. Air Force. It gives a detailed instruction how a Mapping Section works from the time the aerial negative is developed until the final map is printed by Photomechanical process.

TOPOGRAPHICAL MAPPING BY PHOTOGRAMMETRIC METHODS

TYPE: 16mm Color Motion Picture. TIME: 90 minutes.
SOURCE: Same as above.
CHARGE: Free (Return Postage).
CONTENT: This film, made by the Pan American Institute of Cartography and History and the U.S. Geological Survey, gives detailed instructions how to do Topographic Mapping with the application of Photogrammetry. It shows the sections at work and gives step by step instructions of how to do it.

A-2 PORTABLE PHOTOGRAPHIC LABORATORY (TF-1-847).

TYPE: 16mm Motion Picture. TIME: 29 minutes.
SOURCE: Assistant Chief of Staff, Intelligence, Motion Picture Service Div.
CHARGE: Free.
CONTENT: The film explains the operation of an A-2 Portable Laboratory. It shows inspection prior to starting on a mission, selecting the site, setting up the lab, and developing a reconnaissance strip. Speed and teamwork is emphasized.

PHOTOGRAPHIC INTERPRETATION TECHNIQUE: (TF-1-870)

TYPE: 16mm Motion Picture. TIME: 21 minutes.
SOURCE: Assistant Chief of Staff, Intelligence, Motion Picture Service Div.
CHARGE: Free.
CONTENT: The film shows the importance of Aerial Photography in modern warfare. It shows the methods of photo interpretation, the instruments needed, the methods of determining scales, the importance of shadow identification, the way to distinguish various features of terrain. A photo-intelligence officer interprets a complete mosaic for a parachute battalion.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

FILTERS FOR PICTURE IMPROVEMENT

TYPE: Illustrated lecture with 56 slides. TIME: 30 minutes.
SOURCE: Eastman Kodak Company.
CHARGE: Free.
CONTENT: Introduction to the use of filters in Photography. The lecture is based upon the effects obtained with the K-2, G, and A Filters and Pola-screen. Sky Control and haze penetration are discussed for black and white and Color Photography.

FILTERS AND THEIR USES IN PHOTOGRAPHY.

TYPE: Illustrated lecture with 25 slides. TIME: 30 minutes.
SOURCE: Ansco, Camera Department, Binghamton, N.Y.
CHARGE: Free (Return Postage).
CONTENT: A discussion of elementary optics and the physics of light, color, and color sensitivity of films. Types of filters and their uses, i.e., compensation, or correction type filter and contrast or effect type filters are shown in relation to photographic optics.

JOURNALISM

TYPE: 16mm Motion Picture. TIME: 10 minutes.
SOURCE: Department of the Army, (Signal Corps)
CONTENT: The film describes and displays the work of a newspaper reporter in various specialized capacities. The story describes the work of great press associations as well as the various types of journalism required for special features such as magazine writing, articles of local or national interest, and trade journals.

THE CARE AND CLEANING OF PHOTOGRAPHIC LENSES (FS 1-48)

TYPE: 35mm Slide Film.
SOURCE: Requisition on Form 104B to Training Aids Division (AF).
CHARGE: Free.
CONTENT: Film emphasizes care of lenses to insure proper functioning, and eliminate photographic defects (See 4th Photo Training Bulletin No. 5). Precautions to be observed in the use of lenses are given as well as the methods of cleaning lenses.

TNG AIDS - PHOTO FILMS (Cont'd)

THE A B C's OF HAND TOOLS

TYPE: 16mm Color Motion Picture. TIME: 33 minutes.
SOURCE: General Motors Corp., Film Section, Detroit 2, Mich.
CHARGE: Free (Postage).
CONTENT: An animated motion picture by Walt Disney shows how tool's are used to get best results. It shows the proper ways to handle wrenches, screw drivers, saws, hammers, chisels and other modern hand tools. The film is education and instruction smoothly compounded to make the process of learning practical and entertaining.

THE PAPER NEGATIVE PROCESS

TYPE: Illustrated lecture with 10 slides and 10 exhibits. TIME: 45 minutes.
SOURCE: Eastman Kodak Company.
CHARGE: Free (Return Postage).
CONTENT: This lecture tells how to make the positive and negative and how to retouch them to eliminate details and emphasize others in making pictorial photographs. The story is effectively presented by means of actual samples of positive, negative, and final prints.

GRAININESS AND HOW TO CONTROL IT

TYPE: Illustrated lecture with 30 slides. TIME: 40 minutes.
SOURCE: Ansco Camera Club Department, Binghamton, N.Y.
CHARGE: Free (Return Postage).
CONTENT: A question and answer lecture on the problems of Graininess. In succession the statements are concerned with: The inherent characteristics of film, the influence of processing upon grain, and a detailed discussion of the characteristics of different developers.

TONE AND TONING CHARACTERISTICS OF ANSCO PAPER.

TYPE: Illustrated lecture with 12 charts. TIME: 40 minutes.
SOURCE: Ansco Camera Club Department, Binghamton, N.Y.
CHARGE: Free (Return Postage).
CONTENT: Lecture divides toning process into four groups and discusses each in turn. These are: toning by direct development, toning by means of converting the silver image into colored metallic salt, dye toning by mordanting and dye-coupling.

TNG AIDS - PHOTO FLTS (Cont'd)

TIPS ON KODACHROME AND KODACOLOR

TYPE: Illustrated lecture with 42 slides and 12 inch record. TIME: 15 minutes.
SOURCE: Eastman Kodak Company.
CHARGE: Free (Return Postage)
CONTENT: The lecture gives practical information on picture taking with Kodachrome and Kodacolor film. It stresses points of technique in making color photographs such as light quality, lighting, contrast, exposure and composition.

HISTORY AND PRINCIPLES OF COLOR PHOTOGRAPHY

TYPE: Illustrated lecture with 29 slides. TIME: 40 minutes.
SOURCE: Eastman Kodak Company.
CHARGE: Free (Return Postage).
CONTENT: The lecture discusses the present day color processes and shows the development and principles upon which all color processes are based. It gives an analysis of the color theory by discussing the properties of light and their relation to color.

ANSCO COLOR FILM AND HOW TO USE IT.

TYPE: Illustrated lecture with 50 slides. TIME: 50 minutes.
SOURCE: Ansco, Camera Club, and School Service, Binghamton, N. Y.
CHARGE: Free (Return Postage).
CONTENT: This lecture shows the proper exposure and use of Ansco Color Film. It covers such topics as film types, subject matter, lighting, color balance and filters. The lecture is not too technical for trained photographers.

SUBTRACTIVE COLOR PHOTOGRAPHY.

TYPE: Illustrated lecture with 25 slides. TIME: 60 minutes.
SOURCE: Ansco, Camera Club and School Service, Binghamton, N.Y.
CHARGE: Free, (Return Postage)
CONTENT: The lecture is a serious technical discussion of the principles of the subtractive color process. It covers the history high-lights of color photography, the early and modern color processes, and a detailed analysis of the workings of the subtractive color process.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

Notes to Instructors

1. This training outline is offered as a guide to personnel responsible for the preparation of training schedules for armament flights within the Volunteer Air Reserve Training Unit program and provides a ready list of references covering the armament field. In many instances this source material may be augmented. For example, the Air Force Extension Course Catalog offers courses obtainable from the Unit Guidance Branch, Benjamin Harrison AF Base, Indiana, which are valuable aids to both units and interested qualified individuals. The completion of such courses allow for the accumulation of points creditable under the VARTU program.

2. The term armament now embraces the functions previously regarded as those of Air Force Armament, Air Chemical and Air Ordnance (less automotive) and includes atomic and radiological weapons, biological weapons, bombs: guns, ammunition, guided missiles, rockets: chemical warfare: protective armor, sighting, launching and control systems together with components, accessories, fixtures, handling, training, analyzing, and test equipment, targets, and the like, necessary to accomplish the Air Force Mission.

3. With this coverage the family of military occupational specialties to be included must be correspondingly broad. Officer and enlisted specialties, any or all of which may be included in armament training flights, have been listed in this guide. It will be noted that due to armament technical development and action to stabilize the armament career field, both officer and enlisted specialties are being converted to reflect modernization efforts. Such conversions as have been published are also listed.

4. This outline includes sufficient material to provide armament flights with four (4) hours' training per month for a period of three (3) years and is

2378

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

arranged in a normal development sequence with basic material listed early in the outline and specialized material offered in later periods. However, there is no objection to any rearrangement or substitution of material to meet the requirements of a specific armament flight provided that training schedules are approved by the appropriate numbered air force prior to implementation as required by paragraph 7c of AF Regulation 45-23. It is realized that considerably more than one hundred forty-four (144) hours would be required to thoroughly cover the material offered, therefore, the hour figure listed at each subject is only a suggested time derived from an attempt to balance the outline and gives weight to each subject in accordance with its scope and/or significance.

5. A number of methods may be applied by the instructor for the purpose of achieving effective learning. A brief summary of these includes the lecture method, the discussion or seminar method, and the panel method. Everyone is familiar with the lecture method. It should be used sparingly, since it achieves the poorest results. The discussion or seminar method encompasses the active participation of the entire group under the leadership of one or more members. It is an excellent method of instruction when all members of the group are well prepared. The panel method, whereby under proper guidance two or more members present the material to be covered, also offers a most productive method for learning. To apply the panel method to the outline inclosed, the instructor would assign individual hours to two or more members of the flight. The net result of this type of assignment would be an equitable distribution of the subjects to be covered among all the members of the flight without imposing an undue burden on any one or more individuals. Each panel would take for its guide the brief outline for the hour assigned and expand it for presentation in accordance with its experience and the reference materials

2379

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

available. This method has the additional advantages of promoting an improving type of competitive spirit and a feeling of unity among the members as they work on the individual panels for their presentations.

6. Regardless of the method used, sufficient time must be allowed for the preparation of each period of instruction. In this connection, the instructor, or the seminar or panel leader, must have a lesson plan for a specific period of instruction. A good plan will include the following main steps:

a. Objective of instruction.

b. Teaching devices to be used.

c. The procedure or points to be covered, in their proper sequence.

d. A check-up and review to emphasize important points covered and to stimulate thinking.

e. Questions: these questions should be prepared in advance for the purpose of offering them to the group should the group not have any questions to ask during this portion of the period.

f. Comments and remarks which by their constructive nature could be utilized for future periods to improve the technique used.

7. In general, effective planning is the basis of good teaching; therefore, it is suggested that for each specific subject definite objectives be established and all material be carefully planned.

ConAC TRAINING STANDARD)
10-12 (Tentative))

HEADQUARTERS CONTINENTAL AIR COMMAND
Mitchel Air Force Base, N.Y., 17 March 1950

FIGHTER-BOMBER UNIT

(F-51-D AIRCRAFT)
(T/O&E 1-27R, 1-12R)

1. Unit Mission. The mission of a Fighter-Bomber unit is to achieve and maintain a level of operational effectiveness which will enable the unit to:

a. Destroy enemy air and surface targets.

b. Destroy enemy air and surface targets in cooperation with friendly surface forces.

c. Provide protective cover for offensive air operations.

2. Training Objective. a. The general training objective of a Fighter-Bomber unit is to attain and maintain that state of technical, tactical and administrative proficiency which will enable the unit to perform its mission.

b. The purpose of this training standard is:

(1) To establish the specific standards of proficiency that must be attained in order to qualify Fighter-Bomber units for the accomplishment of the assigned mission.

(2) To insure that the activities of all individuals and sections comprising the unit will be so directed that the unit will function efficiently as a unit.

(3) To provide guidance for the development of unit training programs which will emphasize the development of effective tactics and techniques for offensive and defensive air-to-air and air-to-ground operations in cooperation with friendly surface forces.

3. General Individual Training. Each officer and airman will maintain the basic qualifications for his military occupational specialty as described in AF Manual 35-1 in accordance with the intent of the AF Individual Training Standards contained in AF Manual 50-6. Further general training will establish a knowledge of the following basic military subjects: unit mission, leadership, customs and courtesies of the service,

*This Training Standard supersedes ConAC Training Standard 10-12 (Tentative), 6 December 1949.

M-50-17

close order drill, Articles of War, ground safety, special weapons, security intelligence, medical training and basic weapons.

4. Unit Training. a. Administrative. All personnel and sections performing administrative functions within the unit will be at that level of training necessary to give complete administrative support to the unit in the accomplishment of its assigned mission.

b. Technical. The efforts of each of the technical sections must be directed toward the attainment of a common objective. This objective is to maintain the maximum possible number of assigned aircraft in a constant state of combat readiness and to provide the required flying hours necessary for the accomplishment of the unit mission. The minimum acceptable daily in-commission rate which the technical sections must provide is 70% of the assigned aircraft. The number of flying hours that the efforts of the technical sections must provide is an average of 21 hours a month for each assigned aircraft. In-commission as herein used is defined as that state of readiness which enables an aircraft, without additional maintenance, to fly safely and participate in the combat mission of the unit.

c. Tactical. To attain the operational proficiency desired of the unit as a whole, the following requirements must be met:

(1) The development of an aggressive spirit in all personnel to accomplish the mission.

(2) The ability to collect, collate, evaluate, and disseminate military information in accordance with the standing operating procedures.

(3) The ability to conduct efficient combat crew briefings and interrogations.

(4) The knowledge, understanding, and ability to execute the unit defense plan by all personnel.

(5) The ability to reservice one flight (4 aircraft) participating in "turn-around" mission with fuel, oil, coolant, oxygen, film, ammunition, rockets and/or bombs, napalm, or chemical spray in 30 minutes from time first aircraft stops engine until last aircraft starts engine.

(6) The ability to service 12 aircraft participating in "turn-around" mission, with fuel, oil, coolant, oxygen, film, ammunition, rockets and/or bombs, napalm or chemical spray in 45 minutes from time first aircraft stops engine until last aircraft starts engine.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

(7) The unit will be capable of commencing an airlift movement of a combat team within four hours of receipt of movement order. For the purpose of this directive, a combat team is defined as 16 aircraft with sufficient personnel, supplies, and equipment to insure 15 days operations (field maintenance excluded).

(8) Ability of squadron to ascend and descend through an overcast by approved tactics and techniques.

(9) Ability to maintain the integrity of a 4-aircraft formation while ascending and descending through an overcast.

(10) Squadron will be capable of operating during the hours of darkness within the scope of night operations required by day fighters to include take-off in elements of 2 aircraft and landing under conditions of minimum lighting.

(11) The ability to locate and identify specific targets from gridded maps and aerial photographs.

(12) The ability to effectively attack enemy front line troops and installations which are in close proximity to friendly troops (under the direction of a forward controller and other units of the Tactical Control System).

(13) The ability to rendezvous with other formations at a predesignated point, altitude, and time.

(14) The ability to escort and protect formations of friendly aircraft in accordance with approved tactics and techniques.

(15) Squadrons, flights, and elements will be capable of immediate response and precise execution of verbal directions from the ground controller for changes in vectors and altitudes in accordance with RT procedures outlined in JANP-142.

(16) Upon making visual contact with the target, the unit will be capable of moving into position for the "kill" in accordance with established tactics and techniques.

5. Combat Crew Training. Pilot (MOS 1054). The pilot will be trained to a degree which will enable him to handle his aircraft with skill and confidence. The pilot will meet and maintain the following requirements:

a. Proficiency in:

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

(1) Instrument flying to the extent that he qualify under the provisions of AF Regulation 60-4 for the instrument card for which his experience and service qualify him.

(2) Taking off by day or night within the provisions of weather minimums established in current technical orders and USAF Regulations for holders of Form 8 (White) instrument card and within the limitations of the particular aircraft.

(3) The use of all aids to navigation which are capable of being employed with the equipment in the F-51D type aircraft.

(4) Planning and accomplishing maximum range navigational flights at high and medium altitudes during periods of daylight and darkness and be capable of making good the ETA within 5% of the estimated total flight time at altitudes of 15,000 feet and below.

(5) Air-to-air gunnery to the extent that he will be capable of scoring 30% hits at 10,000 feet, 20% hits at 20,000 feet, and 10% hits at 25,000 feet on the A-6A type tow target.

(6) Air-to-ground gunnery to the extent that he will be capable of scoring 50% hits on standard type ground targets.

(7) Rocket firing to the extent that he will be capable of scoring 50% hits on rocket targets.

(8) Dive bombing to the extent that he will be capable of scoring 80% hits within a 50-foot radius.

(9) Skip bombing to the extent that he will be capable of scoring 75% hits.

(10) Napalm (fire bombing) to the extent that he will be capable of scoring 90% hits.

(11) Conduct offensive chemical spray mission, employing smoke or toxic-spray with knowledge of wind drift and type of atmosphere.

(12) Low altitude navigation and in the approved techniques of low altitude approach attack and withdrawal.

(13) Employ effective techniques and tactics in air-to-air combat.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

(14) The execution of normal and emergency procedures necessary for the operation of the aircraft.

(15) Servicing and rearming the aircraft and performing the prescribed preflight and daily inspections, and have a general knowledge of maintenance procedures and practices as well as of all systems of the aircraft and their characteristics and performance.

(16) The application of cruise control principles and procedures in the planning and execution of long range flights.

(17) The use of emergency RT procedures as outlined in JANP-107.

(18) Performing air acrobatics within the technical limitations of the type aircraft.

(19) Recognizing and identifying friendly aircraft and surface equipment.

b. Knowledge of:

(1) The methods of abandoning aircraft over land and water, crash-landing techniques, dinghy use, survival kits, and other life saving equipment with which provided.

(2) The operation, use, capabilities, and limitations of all communications equipment with which aircraft is equipped.

(3) The purpose and application of world-wide recognition systems as outlined in JANP-150.

(4) The problems of high speed and high altitude flying, the physiological effects of high altitude, anoxia, and vertigo, and be capable of properly using oxygen equipment.

(5) The capabilities of enemy anti-aircraft artillery and radar, and methods of evasion.

(6) The characteristics of potentially hostile aircraft and missiles and of the approved and/or locally devised tactics and techniques to accomplish their destruction.

(7) The capabilities, limitations, and procedures of tactical air control equipment.

(8) Meterology to include interpretation of weather symbols in weather reports, effect of ice on aircraft, danger in thunder storms, and frontal activity.
