One aspect of the site involves a rounded, smooth, light colored object that has angles and oblongs and squares and flats, with an interior and exterior and involves moving and turning. There is a further sense of being enclosed and stuffy. There is a hill or mountain or bluff nearby. There is an impression of something large and rounded with a circumference, turning freely as if mounted on gimbals or bearings. There are roller shapes and a humming sound "like" servo motors. Machinery is involved. "Target Object 'L'" involves angular components, edges, plus rounded portions and is very complex. It includes a housing as an exterior, which functions as external shielding protecting interior--reminds me of the glass case enclosing the electric utility meter on the back of a house. The casing or cover--or at least portions of it--can be removed for access. Exterior of the object is exposed to the elements but critical components need protection and cannot be exposed to moisture, dust, etc. The setting is non-populated in the immediate vicinity. Low vegetation and a telephone/power line are present; there is a fair amount of up-and-down terrain relief. There are heterogenous structures nearby that are arranged at various angles to each other. Surroundings remind me of terrain around Mel's site. There is a tall, vertical structure nearby with "spidery" construction, thin, and perhaps red. Reminds me of an antenna or umbilical tower. It has to do with centralized communications, "dedicated circuit," and is somehow affiliated with electronic things, "like" telemetry. There is an associated structure that is spacious inside, lighted, clean, quiet, with a hard, shiny floor. Target object has louvers connected with it, venting, exhausting something which has a noxious, yucky, nauseous quality about it. There is a sense of sealing in--controlled atmosphere with inert gasses protecting intricate parts involving precise operation. Spinning. Intricately balanced (A/S of gyroscope). May have to do with power generation of concentration/conversion. Reminds me of something that has precise, intricate gearing sealed in a nitrogen atmosphere to avoid contaminants and friction.

Object is off by itself--i.e., removed from immediate vicinity of other structures. But exterior doesn't reflect precisely on interior--outside form doesn't precisely correspond to internal functioning and structure. Shape of outside is designed somewhat not to give away what's on inside, though there are limitations as to how far this can go. Internal functioning must take place in isolation, outside other structures but must be protected from elements.
