Site seems to be experimental, under construction, but like perpetually under construction or redesign for suit experimental purposes. A laboratory is present. People are present, including engineer, who appeared to be planning, organizing, + constructing for some purposeful end. Emotions crossed a spectrum from boredom to matter-of-fact to anticipatory. A very large structure seemed to be the center of the "project," and was not finished. Some event occurred, unplanned + sudden, which surprised people present, and seems to have produced a haze, fogging, billowing, white, grey, powdery, acid smelling, caustic cloud, (AZ break sounds dreadful; AI got chills) perhaps an aerosol. Cloud produced respiratory effect, i.e. choking + gagging + made people violently ill. Cloud had perhaps a biological component. Event occurred when something became broken. Afterward site had a desolate feel, an air of residual danger, and the few people present ~~had~~ exhibited an atmosphere of emotional devastation + appeared to be searching.

In April 1979 an accident associated with a biological research lab created a large, billowing cloud which killed people enveloped by it.

**Biological Agent Suspected  
In Sickness at Soviet City**

A

ORCON/NOT RI

CPYRGHT

*Associated Press*

The State Department said yesterday that an outbreak of disease in a Soviet city last year "may have resulted from the exposure of large numbers of people to some sort of lethal biological agent."

It was the first time that the department has commented on reports in the Western European press that hundreds of Soviet citizens died near the Ural Mountains, in [redacted].

Department officials denied that the timing of the statement was intended to persuade other nations not to participate in the Summer Olympics in Moscow.

Department spokesman David Passage said the evidence was being discussed with the Soviets in Geneva, where a review conference on the 5-year-old treaty banning biological warfare agents is under way.

*Passage declined to go into detail about the evidence the department has. He would not identify the biological agent supposedly involved or say whether the department was certain that deaths occurred.*

Other officials, speaking privately, pointed out that Sverdlovsk is a city closed to Americans. They said the United States has no firsthand clinical evidence. "But there is enough smoke to make us curious about whether there is a fire," one official said.

The Soviets have consistently denied the reports of accidents involving biological weapons.

One report was published on Feb. 13 in Bildzeitung of Hamburg. It said that more than 1,000 people had died after an explosion spewed deadly bacteria into the air. The West German newspaper said that another incident also occurred in 1979 near Novosibirsk.
