Site is (and) structure interface w/water possibly near by, which may serve an auxiliary purpose, but is not primary to site. Main site component is very long, thin, hard, raised, high in middle lower to sides in cross section, has the sense of a "conduit," and provides a passageway or track for some moving item. High levels of energy - electromagnetic - are [essential] to the site. Electricity is used to control this energy + to assist in its generation. The use of a magnetic railgun is suggested. Site is apparently a technical experiment, exploring application in some sort of official capacity.

Long thin structure seems to be composed of segments, @ of which provides an intense "tingley" sensation when touched. The impression is also present of a cylindrical, bullet-shaped object whose surface is very shiny + involved the concept of freedom of movement or "gliding." A sense of very dense material, perhaps "heavy metal" is present. This material seems to be located in at least 2 ^{different} places involved with the site - one of which may perhaps be involved w/the bullet-shaped object.

Involved is a shipping container, which seems to be yellow + heavily reinforced, w/in which is a highly polished metallic cylindrical object which seems to contain some substance. Substance is very unpleasant in character (tastes flat, corrosive, "alkaline," burning), seem to be black in color while in container, but changes color - perhaps to gold - as it proceeds out of container + on to objective.

Object of this exercise is to impart target w/at least one strike. To insure this several or many "flashes" are projected at it. After impact target is studied, examined, analyzed. ~~to appear~~ Target B →
