I OBJECTIVE (U)

(S) The objective of the Remote Viewing (RV)* Reliability, Enhancement, and Evaluation Task is to develop remote viewing techniques, both to enhance the potential for US applications, and to provide data that may be useful in assessing the threat potential of corresponding Soviet applications.

⁽U) RV (remote viewing) is the acquisition and description, by mental means, of information blocked from ordinary perception by distance or shielding.

II INTRODUCTION (U)

- (S) SRI International is tasked with assessing the potential of RV for intelligence applications. In this task, as defined for fiscal years (FY) 1981 through 1983, special emphasis is placed on the possibility that enhancement techniques can be developed that will significantly increase levels of accuracy and reliability.
- (S) The three-year effort focuses on (1) the development of techniques to enhance the accuracy and reliability of RV, (2) the application of RV to operational tasks, (3) the evaluation of such techniques and applications, and (4) the integration of RV intelligence into the overall intelligence mix. The apportionment of these efforts over the three-year period is shown in Figure 1.
- (S) Investigation of the RV phenomenon at SRI International over the past decade has ranged from basic research, where proof of the existence of the phenomenon was at issue, to operational applications, in which the existence of the phenomenon is assumed. The present study emphasizes applicability—proof of the phenomenon is not explicitly pursued here. Some pragmatic measure of demonstration of existence is provided, however, by assessment of the quality of results obtained in operational tests carried out under the double-blind conditions.
- (S) In this report we discuss the effort for FY 1982. This effort consisted of:
 - (1) Continued development of a six-stage RV training procedure, hypothesized to lead to improved RV performance. Special emphasis was placed on developing tools that were useful in differentiating and identifying technological facilities.

3

4

SECRET

(S)

- (2) Training undertaken with five SRI-chosen volunteer novice trainees as part of an in-house evaluation program.
- (3) Training undertaken with two Army INSCOM personnel as part of a technology transfer/external evaluation program.
- (4) Generation of data by experienced remote viewers in response to operational requirements.
- (5) Development of a general RV evaluation protocol.*
- (6) Development of a computerized data-base management system (LSI 11/23 stand-alone microcomputer).

6

III RV ENHANCEMENT TASK (U)

A. Tasking (U)

(S/NF) SRI International is tasked with working toward the development of RV enhancement procedures that will accommodate future DoD needs. Of particular interest is the development of procedures that can be transmitted to others in a structured fashion (i.e., "training" procedures), and that can be used in targeting on distant sites of military or intelligence significance.

B. Six-Stage RV Enhancement Procedure (U)

(S/NF) At the beginning of the DIA/Army Joint Services Program (FY 81), SRI, in conjunction with its sponsors, made a decision to develop and codify the most promising RV enhancement procedure that had emerged from earlier work—a six stage training procedure developed by SRI consultant Mr. Ingo Swann. The procedure focuses on improving the reliability of remote viewing by controlling those factors that tend to introduce noise into the RV product. The basic components of this procedure consist of (1) repeated target—address (e.g., coordinate) presentation, with quick—reaction response by the remote viewer (to minimize imaginative overlays), (2) the use of a specially—designed, acoustic—tiled, featureless homogeneously—colored viewing chamber (to minimize environmental overlays), and (3) the adoption of a strictly—prescribed, limited interviewer patter (to minimize interviewer overlay). A broad overview of the procedure, which has been derived empirically on the

7

SECRET

- (S)
 basis of a decade of investigation into the RV process, is presented in
 the document footnoted below.
- (U) At this stage of near completion of the development, the RV training procedure proceeds through a series of six stages of proficiency, hypothesized to correspond to six stages of increased contact with the target site. The stages are outlined in Table 1. In a given remote viewing session, an experienced remote viewer tends to recapitulate the six stages in order.

Table 1

(U) STAGES IN REMOTE VIEWING (U)

Stage		Example
I	Major gestalt	Land surrounded by water, an island
11	Sensory contact	Cold sensation, wind-swept feeling
III	Dimension, motion, mobility	Rising up, panoramic view, island outline
IV	Qualitative aspects	Scientific research, live organisms
v	Significant analytical aspects	BW preparation site
VI	Specific quantitative aspects	Name of island, personnel associated with site

C. FY 82 Progress (U)

- (U) During FY 82, three major subtasks were pursued with regard to continuing the development and technology transfer of the six-stage RV enhancement procedure.
- (U) The first subtask focused on developing procedures specifically applicable to the differentiation and identification of technological facilities (considered in our nomenclature a Stage IV process). With Swann acting as the remote viewer, 75 technological sites (nuclear power plants, dams, radar installations, missile launch facilities, and so forth) were viewed with the goal of developing discrimination accuracy. A list of the sites is provided in Appendix A. Examples of the level of detail and discrimination attained in this research/training phase are shown in Figures 2 through 5. Results of this quality are seen on a relatively routine basis and, therefore, at a rate well exceeding chance correlation.
- (U) The second subtask consisted of the orientation/application/testing of the procedure with five novice remote viewers, all of whom are SRI staff members or consultants without previous remote viewing experience. These individuals have all completed Stage I training and are now progressing through various levels of Stage II. The results to date continue to support the hypothesis that the remote viewing technology can be transferred to trainees on the basis of orientation, coaching, and practice.
- (S) The third subtask was devoted to beginning transfer of the six-stage procedure to two Army INSCOM personnel who were sent to SRI on three separate occasions during FY 82. One of these viewers is at mid-Stage II, on the basis of 53 RV site viewings; the second viewer has nearly completed Stage II, on the basis of 77 RV site viewings. The level reached by the latter viewer can be seen from his final four viewings before his return to INSCOM headquarters (Figures 6 through 9).

IV OPERATIONAL RV TASKS (U)

A. Operational RV Tasking (U)

(S) To meet program objectives, one of SRI's tasks is to investigate US capabilities in applied RV, both to determine the potential for application in US efforts, and to provide data that is useful in assessing the threat potential of corresponding Soviet applications. In response to this requirement, SRI has pursued application tasks that were of interest to the intelligence community, and have responded to quick-reaction requirements set by representatives monitoring the progress of the work.

B. RV Session Format (U)

(S) The format for carrying out these tasks during FY 82 is as follows. A request for information concerning a target site is transmitted by the client to the DIA representative the Joint Service Program COTR in residence at SRI. He then provides targeting information (e.g., coordinates) to an SRI RV session monitor at the start of a session. This monitor then works with a remote viewer to obtain data. In this format, SRI personnel are kept blind to the source of the request, and to the type of site or event of interest. In some cases, the COTR is present during the RV session, or he may even conduct the session himself.

C. Pre- and Post-Operational Task Calibration (U)

(S) In an effort to determine whether a remote viewer is "on line" before attempting an operational task, a presession calibration trial is carried out on a site for which feedback materials (e.g., National Geographic magazines, travel brochures) are available to the session

18

SECRET

Approved For Release 2000/08/07 : CIA-RDP96-00788r001300330001-2

SG1J

(S)

monitor. If the results indicate a useful level of RV functioning, the operational task is engaged; if not, the task is aborted. In like fashion, a postsession calibration trial is carried out to provide a check on whether the viewer remained "on line" during the operational task.

D. FY 82 Operational RV Sites (U)

(S) The tasks carried out during FY 82 are listed in Table 2. Additional detailed data are provided in the operational Task Summary Sheets provided in Appendix B. Complete documentation (transcripts, evaluations, and so forth) can be made available through SAO channels on a need-to-know basis.

E. Evaluation of the Operational RV Task (U)

- (U) Evaluation protocols were developed for use by analysts to provide numerical estimates of various aspects of the RV product generated in operational RV tasks. The returned protocols constitute the basis for contractor evaluation, feedback to the remote viewer, and as an input for the computerized data-base management (DBM). The evaluation protocols submitted to the analysts for their completion are provided in Appendix D of the below footnoted document.
- (U) While awaiting the bulk of evaluation protocols, the contractor has completed development of a computerized data-base management system to handle this material. This system, programmed on a stand-alone LSI 11/23 system, provides a library/catalog function of data-base readout by

V SUMMARY OF THE FY 82 RV ENHANCEMENT TASK (U)

- (S) Progress in the FY 82 RV Enhancement Task can be summarized as follows:
 - · RV enhancement procedure further developed.
 - Special emphasis on procedures applicable to identification of technological facilities.
 - 75 RV research/training practice trials with I. Swann.
 - Procedure transfer begun to five novice SRI staff members and consultants.
 - Orientation and practice through various levels of Stage II.
 - Procedure transfer begun to two novice Army INSCOM personnel.
 - One RVer mid-Stage II; 53 RV training trials.
 - One RVer nearly complete on Stage II; 77 RV training trials.
 - Data obtained on Operational Sites J.S. #23 through J.S. #34.
 - RV evaluation protocols developed.*
 - Computerized RV data-base management system developed to completion (LSI 11/23 stand-alone microcomputer).
